FOREWORD

Minerals Yearbook, 1943, records the contribution of the mineral industries during the second year of United States participation in the war. Again it is gratifying to note that despite many difficult conditions that hampered an all-out effort for mineral production—most if not all of them beyond the control of the industry—a new peak of accomplishment has been achieved. For the fifth consecutive year the quantity of minerals produced has increased, and in each of the last 4 years the physical volume of production has exceeded all previous records.

The outlook as of July 1944 appeared to indicate that 1943 probably witnessed the summit of industrial effort in this war and thus possibly was the war year of highest mineral production and consumption. Beginning in 1939, the output of armament and the construction of war-plant and military installations proceeded hand in hand, both at an accelerating rate. By the end of 1942, however, construction had passed its peak, and the downward trend continued in 1943 and into 1944. Industrial output continued to soar throughout 1942 and most of 1943, but by the end of 1943 and during the first half of 1944 it appeared to have reached a relatively stable level.

The foregoing situation focuses attention on many serious problems relating to reconversion of the mineral industries to a peacetime basis and the outlook for the future. Of immediate concern is the disposal of surpluses on hand at the end of the war. Efforts to assure orderly disposal of mineral stocks after the World War of 1914–18 were unsuccessful. Inventories were dumped on the market to such an extent that prices were depressed to distress levels. Production was drastically curtailed, with resultant unemployment and financial loss to the industry. Government and industry are considering methods for avoiding a repetition of this experience. Linked with this problem is the widely endorsed proposal to freeze post-war mineral and metal surpluses for a permanent stock-piling program for national defense. Longer-range consideration should be given to the future of our mineral reserves, which have been depleted at an abnormal rate during the past 4 years, while industry has been restrained from carrying on exploration and prospecting for new deposits, so that developed reserves of some minerals at present are unusually low. This situation needs prompt attention if the United States is to continue to enjoy the same measure of self-sufficiency as in the past.

The economic and statistical services of the Bureau of Mines have been invaluable tools in the planning and administration of the war mineral program. They will be equally valuable in the post-war years, not only in solving reconversion problems but in the orderly and efficient conduct of the mineral industries in the succeeding years of peace. With this in view the Bureau of Mines is already planning its conversion to a peacetime status to be ready to give maximum service when it is needed. Wartime expansion of its facilities and accession of the former Bituminous Coal Division of the United States Department of the Interior will assist the Bureau in achieving this objective.

Again it is a pleasure to acknowledge with appreciation the cooperation of those who contribute so much to the Bureau's work in this field. Thousands of mine, mill, and smelter operators, distributors, consumers, public officials and agencies, and trade journals have made generous contributions of data and advice. Especial mention should be made of the cooperation of State officials who have assisted in collecting mineral statistics within their respective jurisdictions, thus eliminating duplication and improving coverage and accuracy of data. State agents cooperating in the 1943 canvass were: Stewart J. Lloyd, assistant State geologist, University, Ala.; Herman Gunter, State geologist, Tallahassee, Fla.; Garland Peyton, director, division of mines, mining, and geology, department of natural resources, Atlanta, Ga.; M. M. Leighton, chief, and Walter H. Voskuil, mineral economist, State geological survey division, Urbana, Ill.; A. C. Trowbridge, director, Iowa Geological Survey, Iowa City, Iowa; John C. Frye, acting director, State Geological Survey of Kansas, Lawrence, Kans.; J. T. Singewald, Jr., director, department of geology, mines and water resources, board of natural resources, Baltimore, Md.; R. A. Smith, State geologist, Lansing, Mich.; Edward L. Clark, State geologist, Rolla, Mo.; Edward Ellingwood, chairman, New Hampshire mineral resources committee, Concord, N. H.; Meredith E. Johnson, State geologist, Trenton, N. J.; C. A. Hartnagel, State geologist, New York State Museum, Albany, N. Y.; Jasper L. Stuckey, State geologist, Raleigh, N. C.; Robert H. Dott, director, Oklahoma Geological Survey, Norman, Okla.; E. P. Rothrock, State geologist, Vermillion, S. Dak.; E. H. Sellards, director, bureau of economic geology, Austin, Tex.; Arthur Bevan, State geologist, and Linwood H. Warwick, chief clerk, Virginia Geological Survey, Charlottesville, Va.; Sheldon L. Glover, supervisior, division of mines and mining, department of conservation and development, Olympia, Wash.; Paul H. Price, State geologist, Morgantown, W. Va.; and E. F. Bean, State geologist, Madison, Wis. In addition, B. D. Stewart, department of mines, Juneau, Alaska, and Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for Alaska and California, respectively.

R. R. SAYERS,
Director.

Coal:
Bituminous coal and lignite, by W. H. Young, R. L. Anderson, and L. H. Isaac 832
Pennsylvania anthracite, by Joseph A. Corgan, J. W. Buch, and M. I. Cooke 944
Coke and byproducts, by J. A. DeCarlo, M. M. Otero, and J. W. Buch 982
Crude petroleum and petroleum products, by A. G. White, F. S. Lott, H. A. Breakey, and A. T. Coumbe 1061
Cryolite and fluorspar, by H. W. Davis 1441
Feldspar, by Robert W. Metcalf 1463
Fluorspar and cryolite, by H. W. Davis 1441
Fuel briquets and packaged fuel, by G. S. Goodman 1040
Gem stones, by Sydney H. Ball 1558
Gravel and sand, by G. W. Josephson and G. E. Tucker 1323
Ground soapstone, talc, and pyrophyllite, by Bertrand L. Johnson and K. G. Warner 1431
Gypsum, by Forrest T. Moyer and M. G. Downey 1341
Lime, by Forrest T. Moyer and F. D. Gradijan 1353
Liquefied petroleum gases and natural gasoline, by F. S. Lott and A. T. Coumbe 1206
Magnesium compounds and miscellaneous salines, by Charles L. Harness and Nan Jensen 1541
Mica, by G. Richards Gwinn and K. G. Warner 1513
Minor nonmetals, by G. Richards Gwinn 1576
Natural gas, by F. S. Lott and H. Backus 1170
Natural gasoline and liquefied petroleum gases, by F. S. Lott and A. T. Coumbe 1206
Nitrogen compounds, by Bertrand L. Johnson 1571
Packaged fuel and fuel briquets, by G. S. Goodman 1040
Peat, by Joseph A. Corgan 1057
Petroleum products and crude petroleum, by A. G. White, F. S. Lott, H. A. Breakey and A. T. Coumbe 1061
Phosphate rock, by Bertrand L. Johnson and K. G. Warner 1414
Potash, by Bertrand L. Johnson and K. G. Warner 1496
Pyrites and sulfur, by G. W. Josephson and M. S. Jensen 1400
Pyrophyllite, ground soapstone, and talc, by Bertrand L. Johnson and K. G. Warner 1431
Salt, by F. E. Harris and K. G. Warner 1527
Sand and gravel, by G. W. Josephson and G. E. Tucker 1323
Slate, by Oliver Bowles and M. S. Jensen 1314
Stone, by Oliver Bowles and M. S. Jensen 1278
Sulfur and pyrites, by G. W. Josephson and M. S. Jensen 1400
Talc, pyrophyllite, and ground soapstone, by Bertrand L. Johnson and K. G. Warner 1431
Witherite, barium chemicals, and barite, by Charles L. Harness and K. G. Warner 1484

Part IV. Mine Safety:

Employment and accidents in the mineral industries, by W. W. Adams 1590
Index, by Mabel E. Winslow 1602

INTRODUCTION

Although Minerals Yearbook, 1943, follows essentially the make-up of earlier volumes, certain changes have been introduced to supply more effectively the needs of the mineral industries for up-to-date statistics.

Chief of these is making current for the first time since 1931 the detailed mineral production by States in the chapter on the Statistical Summary of Mineral Production. Iron ore constitutes a separate chapter, with another on pig iron, ferro-alloys, and steel, whereas formerly the four commodities were grouped under one heading. A number of chapters have been expanded to give certain minerals the proper place in a changing wartime economy, but others necessarily have been reduced, and the chapter on Wyoming has been combined with that on South Dakota. An added feature in the present volume is a section covering the post-war outlook on all but a few of the minerals treated. A number of new charts have been introduced, and many of the charts that appeared in earlier volumes have been redrafted to improve their appearance and usefulness.

Censorship regulations still require that information on strategic and critical minerals, as well as most foreign trade data, be held confidential; consequently Minerals Yearbook, 1943, will be impounded, as was the 1942 edition, and the volume will be issued only to authorized Government and State agencies that need the information it contains. However, regulations have been relaxed to some extent so that the 15 State chapters, which were confidential in the 1942 volume, are available for public distribution. In addition 9 other chapters, from which foreign trade figures have been eliminated because they are of slight significance, will be released.

Acknowledgments.—Collection of the vast quantity of statistical data for Minerals Yearbook is accomplished entirely through the good will and voluntary cooperation of those interested in the welfare of the mineral industries. War conditions have imposed many handicaps on these groups and individuals, but the response has been most generous, and the Bureau wishes to express its deep appreciation of the time and effort given by the multitude of operators, distributors, consumers, public officials, trade associations, and others who have kindly furnished the basic data for this volume.

The data on exports and imports in Minerals Yearbook were obtained through cooperation of the United States Department of Commerce.

The usefulness of this volume is credited largely to the splendid service given by the authors of the chapters and the many members of the Bureau's staff who assisted in the editing and arrangement of the Yearbook material. Those deserving especial mention for assistance in maintaining the high statistical accuracy of the volume are: Martha B. Clark, and Marian E. Meyer, of the Economics and Statistics Branch, for preparing the statistical summary of mineral production and for supervising the presentation of statistical data; Mabel E. Winslow, of the Office of Minerals Reports, for careful editorial work and counsel; Louis F. Perry of the Office of Minerals Reports, and Adelaide B. Palmer, of the Economics and Statistics Branch, for their aid in preparing the charts; and the many members of the Economics and Statistics Branch who helped the authors in the preparation of their manuscripts.

C. E. NEEDHAM.

PART I. GENERAL SUMMARY

REVIEW OF THE MINERAL INDUSTRIES IN 1943[1]

INTRODUCTION

The mineral industry again broke all previous records for total production in 1943 as the value of output soared to $8,056,000,000. The new peak was 6 percent above the previous high of $7,575,700,000 in 1942 and 15 percent above the pre-war record of $6,981,340,000 established in 1920. The rise in value for 1943 resulted from a 2.3-percent advance in the physical volume of production, as measured by Federal Reserve Board indexes, and a 4.5-percent increase in the unit sales realizations of mineral producers.

As in 1942, the mining industry operated under severe handicaps. Scarcity of manpower was the chief hindrance during 1943, but other factors—such as transportation controls, shortage of equipment, increasing costs, shut-down orders for gold and silver mines, and lack of adequate price incentive—also were contributing causes.

Although strict conservation and control measures were continued on a large scale in 1943, many minerals were used in greater quantities than ever before. There were some sharp recessions, however, particularly in the demand for building materials. The net result of these divergent trends was an over-all gain in consumption, which reached a new peak. Heavy imports continued during the year with relative ease as success was achieved in minimizing the effects of enemy submarines. However, shipping space was far from plentiful, as the movement of troops and munitions overseas required a very large proportion of available bottoms. Domestic production and imports again were more than adequate to meet military and essential civilian needs, and there was a small net gain in the Nation's stocks of mineral raw materials.

Price movements in 1943 were generally upward, but except for fuels the gains were inconsequential. An estimated average 4.5-percent gain in price realizations of mineral producers, resulting very largely from increases in coal, petroleum, and petroleum products, compared favorably with the 4.4-percent rise in the general price level as revealed by Bureau of Labor Statistics indexes of wholesale prices.

---

[1] In this report the term "billion" is equivalent to 1,000,000,000.

However, the comparison is decidedly less favorable with 1940. The average unit return on minerals, including premium payments, as estimated by the Bureau of Mines, has increased only 19.9 percent from 1940 to 1943, whereas wholesale prices have advanced 31.2 percent.

PRODUCTION

Value of mineral output.—The value of minerals produced in the United States in 1943 exceeded 8 billion dollars for the first time and for the second consecutive year established a new peak.

Fuels are the principal contributors to the value of mineral production, having supplied $4,589,000,000 or 57 percent of the total in 1943. Metals ranked second, with $2,493,000,000 or 31 percent of the total, and nonmetals (other than fuels) third, with $974,000,000 or 12 percent. The growth in value of these branches of the mineral industries since 1880 is shown in figure 1.

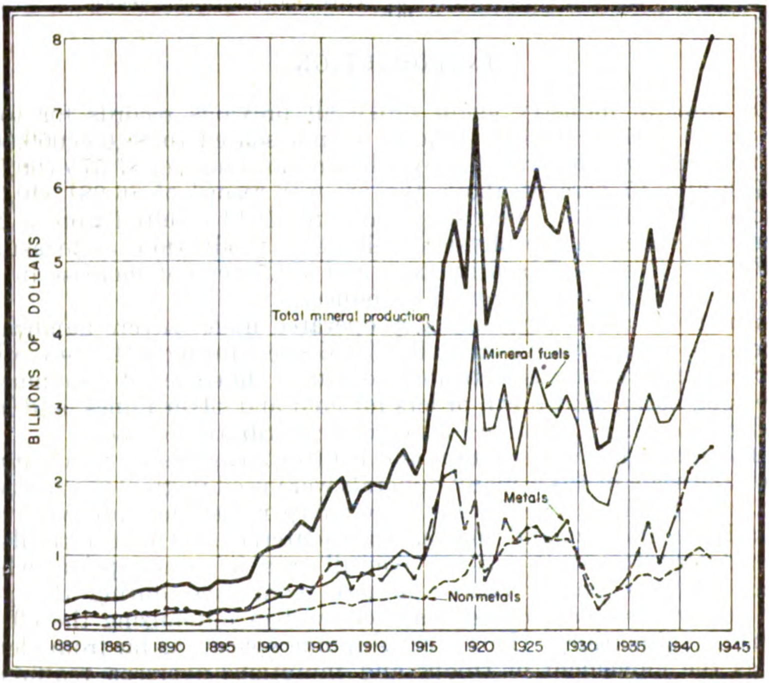

FIGURE 1.—Trends in value of mineral production in the United States, 1880–1943.

All major divisions of mineral production increased in value of output in 1943 except nonmetals (other than fuels). The 12-percent decline in the value of nonmetallic minerals (other than fuels) showed the reduced demand for building materials that resulted chiefly from the sharp drop in military construction. The value of metals was 5 percent above that of 1942; this increase resulted from a rise in both prices and physical volume of production. The value of fuels advanced 12 percent. Oil and gas wells contributed products valued at $2, 713,-000,000 in 1943—34 percent of the total mineral value and an increase of 10 percent over 1942. Hard- and soft-coal production was valued at $1,876,000,000, or 23 percent of the value of all mineral products and 14 percent more than the value of coal produced in 1942.

The 6-percent increase in mineral production in 1943 compares with a 22-percent advance in gross farm income as reported by the United States Department of Agriculture ($18,628,000,000 in 1942 and $22,675,000,000 in 1943, including Government payments) and a 23-percent rise in the gross national product [2] (152.1 billion in 1942 and 186.5 billion dollars in 1943). National income increased from $121,568,000,000 in 1942 to $147,927,000,000 in 1943 (22 percent), according to the United States Department of Commerce. Since 1939 the value of mineral production has gained only 64 percent, whereas gross farm income rose 129 percent, gross national product 110 percent, and national income 109 percent.

Failure of the mineral industry to keep pace with other elements of the national economy may be ascribed to several factors. Some mineral commodities, such as gold, silver, and certain building materials, have been adversely affected by war conditions so that their production has not profited from the general economic improvement. Government controls have restrained civilian and in many instances military consumption of most of the other minerals, and these restraints have been reflected in mining activity. Shortage of manpower, exhaustion or lack of resources, inadequate production capacity, and scarcity of mining equipment have prevented the domestic industry from meeting all war needs of some minerals, and the deficiencies have been made up by abnormally large importations. Copper, lead, and zinc are typical examples of this development. All these factors have retarded the advance in physical volume of mineral production; and in addition, as will be shown later, the rise in the value of mineral production has been impeded by prices that consistently have been substantially below the general level.

Trends in physical volume of production.—Figure 2 compares the physical volume of mineral production during the last 44 years with industrial and agricultural production and with population growth, each expressed in terms of an index based upon yearly averages for 1935–39.[3]

The long-time trends of production during this 44-year period have been steadily upward, although year-to-year and cyclical fluctuations have been prominent. Except for the last few years, the production of minerals—the essential raw materials for industry—has been closely correlated with the trend of industrial production, experiencing the same ups and downs, whereas agricultural production has exhibited more moderate fluctuations and a growth line approximating the trend of population increase.

Because production of coal for domestic use and petroleum for automobile fuel, which has a pronounced effect on the trend of mineral output, does not respond proportionately to increases in the rate of manufacturing activity and is more stable, the index of industrial production tends to exceed that of mineral production in periods of prosperity and to fall below during depressions. This characteristic explains in part the wide gaps between the two indexes from 1941 to 1943. Another contributing factor is the extensive use of imported mineral raw materials in these years, which is reflected in the industrial index but not in the mineral index. It should also be noted that the Federal Reserve Board index of mineral production does not include certain mineral products, such as aluminum and magnesium, while the greatly expanded war production of aircraft in which these metals are used is included in the index of industrial production.

---

[2] The U. S. Department of Commerce defines gross national product as the total value of currently produced goods and services flowing to Government, to businesses for gross capital formations, and to consumers. War expenditures comprised 44 percent of the total in 1943 and 33 percent in 1942.

[3] The following indexes have been used—volume of farm production, U. S. Department of Agriculture; mineral production, 1900–18, from Warren Persons' Forecasting Business Cycles; mineral production of 1919–43 and industrial production, Federal Reserve Board; total population of the United States, Bureau of the Census.

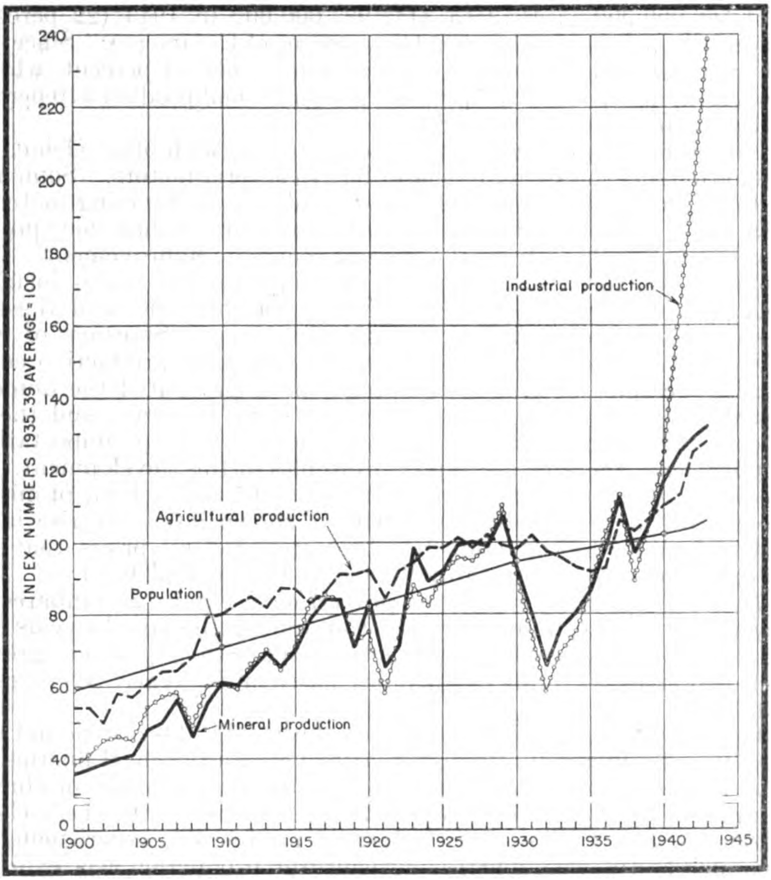

FIGURE 2.—Comparison of growth of physical volume of mineral production with that of agricultural and industrial production and population, 1900–43.

The production of many mineral commodities established new records in 1943, although the achievement in this regard is less spectacular than that of 1942. The light metals again made outstanding advances. Magnesium output almost quadrupled; bauxite production increased 140 percent and that of aluminum 77 percent. The quantity of copper mined exceeded the previous peak of 1942 by only 1 percent, whereas the production of lead and zinc decreased in 1943. Sharp declines also were noted in gold and silver mining. Mercury production advanced again, but the 1943 output was much less than the record established in 1877. Production of titanium minerals, chiefly ilmenite, more than doubled and reached a new high. Domestic output of the ferro-alloying metals—tungsten, molybdenum, vanadium, and chromium—reached new heights in 1942 by substantial margins. Manganese-ore production increased over 1942 but was below the 1918 high. Iron-ore output was 6 percent under the record established in 1942. Production of all the major fuels gained in 1943, bituminous coal, petroleum, natural gas, and natural gasoline, and liquefied petroleum gases reaching new peaks. Anthracite output was only slightly above 1942 and considerably below previous highs. Reduced building activity in 1943 caused a slump in the production of cement, clays, gypsum, sand and gravel, and stone. Production of feldspar and sulfur also declined, but several other nonmetallic minerals (including asphalt, fluorspar, lime, phosphate rock, potash, pyrite, and salt) established new records.

STOCKS

Inventory-control measures continued in effect throughout 1943, but in the second half of the year there was a decided trend toward easing the restrictions that had been imposed earlier in the war. As enemy submarine attacks became less menacing, emphasis on the building up of stocks of materials from overseas sources as a safety measure was relaxed, so that use of ships in moving troops and war supplies could be intensified. On the other hand, consumption schedules for some commodities were scaled down without equal reductions in supply, and inventories rose accordingly. The net result of these developments was a general gain in stocks. For many minerals, a decline in industry stocks was more than offset by increases in Government stocks. This group included antimony, asbestos, beryllium, chromite, copper, Madagascar flake graphite, block mica, platinum, tungsten, and zinc. There were increases in both industry and Government stocks of aluminum, bauxite, cryolite, industrial diamonds, fluorspar, magnesium, mercury, molybdenum, nickel, quartz crystals, lithium minerals, and ground talc. The net total of industry and Government stocks declined for Ceylon lump graphite, Indian kyanite, lead, manganese ore, mica splittings, tin, and vanadium. Industry stocks of iron ore, iron and steel scrap, bituminous coal, anthracite, and ilmenite dropped sharply in 1943, whereas those of pig iron, cement, and magnesite were larger at the end of the year than at the beginning; the Government was not stock-piling any of these commodities. A small increase in industry stocks of crude petroleum was more than offset by a decline in refined products, but the net decline in these inventories probably was less than the gain in Government stocks, indicating a probable net gain in total stocks on hand in the United States.

The large stocks of raw materials on hand, the tremendous increase in the inventories of metals and minerals in process and in finished munitions, and the stocks of battlefield scrap rapidly accumulating at home and abroad—all of which would weigh heavily on post war markets—prompted considerable agitation for a permanent stock-piling program. Developments in this field are discussed under Government Stock-Piling Activities in this summary.

CONSUMPTION

Consumption of minerals continued its upward trend in 1943, but the diminishing rate of increase during the latter half indicated that the United States was reaching its full industrial stride for successful prosecution of the war. Many new records in mineral consumption were made during the year, although several commodities were used less in 1943 than in 1942; on the average, there was a moderate gain. Even larger quantities could have been consumed had it not been for manpower shortages, which proved to be the principal restraining influence in 1943. Manpower rather than available supplies or markets will likewise dominate the situation in 1944 when no substantial increase in mineral consumption is anticipated and a moderate decline may be expected if the war in Europe is concluded at an early date.

The magnitude of the industrial contribution to this war is revealed by the Federal Reserve Board indexes of industrial activity. The index for total production (1935–39 average=100) rose from 89 in 1938 to 238 in 1943. The adjusted monthly index reached a peak of 247 in October and November and then receded to 242 in March 1944. The rise in manufacture of durable goods, in which class most of the munitions fall, was more spectacular, the index having advanced from 78 in 1938 to 360 in 1943, and this rise was accentuated by a shift from the production of civilian goods to the manufacture of munitions. The production index for transportation equipment, which reflects the expanded output of airplanes, automobiles, ships, railroad cars, and locomotives, rose from less than 100 early in 1939 to a peak of 786 in November 1943. There has also been a significant though less substantial increase in the production of nondurable goods, the index having advanced from 95 in 1938 to 176 in 1943.

The war program has required metals, fuels, and industrial minerals in unprecedented quantities, and many new records were established in 1943. Consumption of iron ore, iron and steel scrap, and virtually all the alloying metals that are used in steel making rose to new heights; the use of molybdenum, however, declined. Most of the nonferrous metals also were used in record quantities, the light metals showing the largest increases over 1942 and pre-war rates. Zinc consumption was higher than in 1942 but below the peak of 1941, and the use of tin again was reduced by rigid conservation measures. All the fuels except anthracite were burned in larger quantities than ever before, and many of the other major industrial nonmetallic minerals, including asphalt, fluorspar, lime, sulfur, and salt, advanced to new consumption peaks. New records for the fertilizer and soil-conditioning minerals—phosphate rock, potash, and sulfur—showed the buying power of the 23-percent rise in cash farm income.

In contrast to the continued rise in industrial production, construction activity fell abruptly in 1943. According to the United States Department of Commerce, the total value of all new construction put in place in continental United States during the year was $7,868,000,000, a 55-percent decline from $17,379,000,000 in 1942; the value in 1938 was $5,254,000,000. All major branches of construction—residential, industrial, military and naval, and public utility—were curtailed in 1943. As a consequence, consumption of building materials of mineral origin was affected adversely.

PRICES

The weighted composite index of price change in 1943 for 24 mineral commodities that represent 96 percent of the total value of mineral production during the year indicates a 4.5-percent increase over the average unit realization by producers in 1942. Comparison of the 1943 index with that for 1940, the base year, indicates a total rise of 19.9 percent, of which the larger part was in 1941 when the average returns to producers gained 9.3 percent over 1940. The rate of increase lessened appreciably in 1942 after price ceilings were fixed by Government regulation, and the indicated rise in unit realization for the year was 4.9 percent over 1941. In 1943 the average unit return increased over 1942 in each mineral group; however, the gain in the index for the 5 mineral fuels was largest—5.8 percent. For the metals group (9 commodities), the increase was 2.5 percent, and the index for the nonmetals group (10 commodities) indicated a 2.9-percent gain over the unit realization in 1942. The indicated general rise in the 1943 average unit returns resulted from a variety of factors, the principal ones being subsidies paid to producers of high-cost copper, lead, and zinc and regional and local increases permitted in ceiling prices. Another factor of importance in the nonmetals group was the constriction, either by natural economic forces or by Government regulation, of market areas of products sold on a delivered basis, which resulted in less freight absorption and consequently higher average returns to the producer.

The indicated increase in prices received by mineral producers in 1943 was virtually at the same rate as the rise in wholesale prices of all commodities. According to the Bureau of Labor Statistics, the wholesale price index (1926=100) of all commodities advanced from 98.8 in 1942 to 103.1 in 1943, a 4.4-percent gain. However, during 1941 and 1942 the average unit realization to mineral producers did not increase nearly as rapidly as wholesale prices, and in 1943 the average unit return on minerals was only 19.9 percent above 1940, whereas the wholesale price index was 31.2 percent higher than in 1940. Wholesale prices for fuels increased appreciably in 1943; the indexes for anthracite and bituminous coal each rose nearly 6 percent and for petroleum and its products 4.5 percent over 1942. The strict regulation of prices was illustrated by the general index for metals and metal products, which was unchanged from 1942 at 103.8. Similarly, prices of nearly all component raw materials and fabricated products making up the iron and steel group were unchanged from 1942; the most important exception was ferromanganese, for which the index showed a gain of nearly 4 percent. The wholesale price level of the nonferrous metals group, which includes some finished products and excludes subsidy payments for copper, lead, and zinc, advanced only slightly over 1942, owing principally to increases in antimony and silver prices. Mercury was the only component of this group for which the index declined. In the building-material group, the general wholesale price index increased from 110.2 in 1942 to 111.4 in 1943. However, the prices of most mineral building materials changed little from 1942; and some, such as cement, plaster, and gypsum lath, declined. Brick and tile and paint prices were slightly higher than in 1942. The general index for chemicals and allied products, which includes numerous mineral commodities, increased from 97.1 in 1942 to 100.3 in 1943, a gain of 3.3 percent. Wholesale prices of fertilizer materials as a group gained 1.7 percent over 1942, although the indexes for phosphate rock, potash salts, and sodium nitrate declined appreciably from 1942.

EMPLOYMENT

The severe labor-supply problems that all mining activities had experienced in 1941 and 1942 were continued in 1943 but became less critical as war demands were lowered for virtually all major minerals except coal. Employment continued to decrease because of migration from the mining centers, but the loss of manpower was largely counterbalanced by a general increase in man-hours worked. The number of men employed in the mineral industries in 1943, according to preliminary figures, was 732,600—a 9-percent recession from 1942; man-hours of employment declined less than 0.5 percent. The reasons for manpower losses were largely the same as in previous years, and only strenuous efforts by Government, industry, and labor prevented the situation from becoming critical during 1943.

The major Government employment efforts during 1943 were directed toward replacing lost manpower, preserving vital occupational skills from Selective Service withdrawals, and increasing the utilization of the labor still employed in mining. For virtually the entire year recruitment of labor for metal mining received highest priority from the United States Employment Service in the Western States. Considerable progress was made as a result of this sustained recruiting program, but by midyear it was obvious that the results were insufficient. It was necessary once more for the Army to release soldiers to the mines to make up the deficit. In August and September 1943 the 9th Service Command of the United States Army released 4,500 soldiers to copper, zinc, and molybdenum mines. These soldiers did not have the occupational skills most in demand, but their release aided considerably in meeting the general labor-supply requirements of the mines. Changes in war demands for these metals and the Army's urgent need for young, able-bodied soldiers resulted in the recall of all furloughed soldiers in the age bracket of 18 to 25 during March to June 1944.

Another important step taken by the Government in June 1943 to overcome metal-mining labor-supply problems was the setting up of a Minerals Classification List by the War Production Board for the use of the United States Employment Service in directing referrals and transferring labor from one mine to another. This list set up a system of priorities wherein the various mines were rated by productivity per man.

> Class I operations, listed within metals or minerals, are those operations which are considered at the time of issuance of each classification list to be the most critical to the war economy and are the operations upon which first efforts in recruitment should be concentrated.
>
> Class II operations, listed within metals or minerals, are essential operations to which referrals may be made of applicants for employment who do not accept employment in class I operations whether for reasons of working conditions, location of domicile, climatic conditions, or other reasons. Certificates of availability are to be denied to employees of these operations, except in unusual cases wherein the transfer desired is to a class I operation.

Class III operations, not listed, are all operations not classified as 1, 2, or 4. Although no direct recruitment of employees from these operations is to be allowed, cerificates of availability are to be granted to all voluntary withdrawals, provided the applicant is willing to accept referral to class 1 or class 2 establishments.

Class IV operations, listed as to operations, are operations whose contribution to the war effort is minor in proportion to the manpower and material utilized. Recruitment campaigns among workers at operations in this class is encouraged when such recruitment are for operations in class 1 and class 2.

In general, it is desired that no certificates of availability be granted to workers in any mines, mills, smelters, or refineries (class 1, 2, 3, or 4) except for work at other mines, mills, smelters, or refineries, and except for such transfers as are mandatory under the rulings of the stabilization order. It is urged that every measure be taken to tighten the issuance of certificates of availability to workers who plan to leave the mining industry.

The War Manpower Commission has reported that the use of this list has resulted in increased employment in all class I and II mines, whereas employment in the low-productivity mines of classes III and IV declined.

The employment-stabilization program for the nonferrous metal-mining industry of the 12 Western States, which was set up by the War Manpower Commission in September 1942, was continued throughout most of 1943. In January 1943, Government, management, and labor representatives of the nonferrous mining industry conferred in Denver; at that time a complete review of experience resulted in agreement to continue the program. However, inforcement problems and the great geographical area covered by the industry-stabilization program resulted in the industry type of control being replaced by an area-stabilization program on August 16, 1943 (War Manpower Commission Regulation 7). Reports are in general agreement that turn-over and outmigration were reduced by the stabilization orders, but at best these were only a part of the over-all problem.

Selective Service policies on mining labor were revised during 1943 and resulted in decreased withdrawals for military service. Local boards were instructed to give all mining workers the most serious consideration for occupational deferment, regardless of the degree of skill and whether or not a formal request for deferment of the worker had been made. Selective Service also authorized the transfer of appeals to the area in which the worker was employed rather than in the area of original registration.

Early in 1943 the War Manpower Commission ordered a minimum workweek of 48 hours established for all metal-mining workers in the Western States. Virtually all large operations had already established a 48-hour week, and this order merely made the practice uniform throughout the industry.

Wage increases were prominent only in fluorspar and coal mining during 1943. Loss of workers from fluorspar mines is said to have been halted as a result of a wage-rate increase effected in July. In coal mining the wage increases followed some of the most serious strikes in the Nation's history. With war demands for coal increased to high levels, the industry faced wage controversies which seriously threatened the entire war program. Wage rates were not raised, but the "take-home" was increased by the award of pay for the time spent in traveling to and from the working face (portal to portal) and the raising of the workweek to 48 hours.

By the end of 1943, the mining industry's employment problems, save in coal mining, were largely those of maintenance of production at established levels. In coal mining the problem was still complicated by rising demand and continued, although lowered, losses of manpower through retirements, accidents, and other normal causes, plus the difficulty of training new workers, especially in the more highly mechanized mines.

SAFETY

The combined safety record of the mineral industries of the United States, considered from the standpoint of workers exposed to occupational hazards, was favorable. Although the volume of labor performed was greater (except for 1942) than in any previous year since 1931, when records of man-hours worked first became available, and although the pressure for more war production continued, the accident frequency in relation to the number of man-hours worked did not rise in 1943; on the contrary, the rate was slightly more favorable than in 1942. According to preliminary, figures, the fatality rate for the mineral industries was 1.18 per million man-hours worked, which compares favorably with 1.21 for 1942 and 1.26 a decade ago. The 1943 nonfatal-injury rate was 59.11 per million man-hours, a substantial reduction from 61.24 in 1942 and 73.48 in 1933.

According to present reports, accidents during 1943 resulted in injury to 92,740 employees—about 3,600 fewer injuries or 4 percent less than in 1942—although the number of man-hours of exposure to occupational hazards decreased less than 1 percent. Fatalities declined 3 percent—from 1,861 in 1942 to 1,813 in 1943. Seven major disasters (disasters causing 5 or more deaths) in which 161 men lost their lives occurred in 1943, all in bituminous-coal mines. Six were due to explosions of gas or dust, and one resulted from a mine fire. In 1942, 132 lives were lost in major disasters.

Chief among the mining industries that reported more favorable accident rates in 1943 than in 1942 were bituminous-coal mining and Pennsylvania anthracite mining. Special significance attaches to a reduction in the rates for these two groups, because together they include approximately two-thirds of the total number of employees in all mineral industries combined. Metal mines, considered as a group, made progress in accident prevention in 1943. Several members of the group, however, such as copper mines, lead-zinc mines in the Mississippi Valley States where production was being pushed, and gold-silver mines (operating on reduced employment), reported higher rates. Special credit is due the group of mines that produced such war-needed metals as tungsten, manganese, mercury, and other so-called minor metals for effecting a large reduction in accidents. The stone-quarrying industry operated with an accident-frequency rate that was slightly higher than in 1942 but lower and more favorable than that in 1941. Beehive-coke ovens reported an accident rate that was virtually the same as in 1942; byproducts oven continued to operate with especially low rates, although a fraction higher than in 1942. Mills and concentrating plants reported a reduction in accident frequency. The rate for smelters increased slightly.

A special study, begun 2 years ago, of accidents reported by companies engaged in the production of petroleum was continued through 1943. The study, as far as it had progressed at this writing, revealed an accident-frequency rate of 20.32 per million man-hours worked. This rate was not as favorable as that of 1942, which was 18.27 as shown by final figures, but it was almost the same as the rate finally reported for 1941—20.40.

GOVERNMENT STOCK-PILING ACTIVITIES

Recent experience in the procurement of mineral raw materials for war production and the desire to avoid the deflationary effects on post-war markets that would result from dumping surplus mineral stocks at the close of the war have stimulated considerable interest in a national stock-piling program. On June 3, 1943, a bill (S.1160) was introduced in the Senate of the United States:

> To stimulate production of strategic and critical minerals for the present war effort and to assure an adequate supply of such minerals for any future emergency by continuance, intact, in the post-war period of all stock piles surviving the present war and by necessary augmentation thereof primarily from domestic sources, and for other purposes.

After public hearings on the bill a revised version, S.1582, was introduced on December 8, 1943. Wide divergence of opinion developed on many features of these bills, but there was substantial support for two of the objectives of the proposed legislation—the creation of stock piles for national defense and the freezing of stocks at the end of the war to provide the nucleus for permanent stock piles and to prevent undue dislocation of post-war markets. Several other bills along similar lines subsequently were introduced in Congress, and the executive departments initiated a study of the problem with a view to suggesting a program that would reflect the views of the Executive Branch. As of July 1, 1944, however, no positive action had been taken by either branch of the Government. Interest in permanent stock-piling legislation appeared to have waned temporarily because of the pressure for legislation to facilitate reconversion of industry from a wartime to a peacetime basis.

From the viewpoint of the mineral industries, the freezing of surplus stocks of minerals and metals (including scrap) at the close of the war should be a prerequisite of any program designed to cushion the effects of sudden termination of war production. This is supported by experience following the last war, when the inadequately controlled liquidation of metal and scrap stocks brought on a deflation of the metal markets which resulted in widespread unemployment due to forced curtailment of production from 1920 to 1922. On the other hand, consumers point out that there should be no restraints on raw-material supplies if industry is to meet the tremendous demand for goods that many anticipate will follow the termination of World War II. Freezing of war stocks might retard the production of goods for civilian consumption or induce inflationary tendencies in the raw-material fields that would be inimical to the maintenance of post-war stability. Both viewpoints emphasize the necessity for providing sound controls on the distribution of war-end surpluses in any reconversion program that may be adopted.

During the war the Government has fostered a gigantic purchasing and stock-piling program for strategic and critical materials. This activity was inaugurated in 1939 following the passage of the Strategic Materials Act, Public 117, 76th Congress, which was approved on June 7, 1939. The law authorized the appropriation of

$100,000,000 to be used over a period of 4 years for the purchase and stock-piling of strategic and critical materials; of that sum, Congress actually appropriated only $70,000,000. Collapse of the Allied armies in Europe in May 1940 resulted in a tremendous increase in the defense program of the United States and also focused attention on the need for greatly expanding the procurement of raw materials. On June 25, 1940, Public 664, 76th Congress, was approved, authorizing the Reconstruction Finance Corporation to engage in extensive national defense activities, including the purchase and carrying of strategic and critical materials, as defined by the President. A very large part of all raw material acquired by the Government since 1940 has been procured under the authority granted by this act. As of September 1943 the list of minerals and mineral products that had been declared strategic or critical by the President and the Army and Navy Munitions Board was as follows:

Commodity [1]	Designation [2]	Designated by	Date
Aluminum	C	A and NMB	Jan. 30, 1940
Aluminum bar and rods	S and C*	President	Dec. 17, 1942
Aluminum rivets	S and C*	do	Apr. 15, 1942
Antimony (and ores)	S	A and NMB	Jan. 30, 1940
Arsenic	S and C*	President	July 3, 1941
Asbestos	C	A and NMB	Jan. 30, 1940
Bauxite	C*	do	Mar. 25, 1941
Beryl ores	S and C*	President	Apr. 25, 1941
Bismuth (and ores)	S and C*	do	Do.
Cadmium (and ores)	S and C*	do	Do.
Calcined coke	S and C*	do	Nov. 6, 1942
Chromium (and ores)	S and C*	do	Jan. 30, 1940
Coal	S	do	May 22, 1942
Cobalt (and ores)	S and C*	A and NMB	Apr. 25, 1941
Columbite	S and C*	President	Apr. 2, 1942
Copper (and ores)	C*	A and NMB	Dec. 11, 1940
Corundum ore	S and C*	President	Dec. 5, 1941
Cryolite	S and C*	do	July 3, 1941
Diamonds, industrial (and bort and diamond dies).	S#	A and NMB	June 21, 1940
English china clay	S and C*	President	Sept. 3, 1942
Fluorspar	S and C*	do	Apr. 17, 1941
Gasoline, aviation (100 octane)	C*	A and NMB	Aug. 27, 1940
Glass, optical	C	do	Jan. 30, 1940
Graphite	C	do	Do.
Indium	S and C*	President	Oct. 24, 1941
Iodine	C	A and NMB	Jan. 30 1940
Iridium (and ores)	C*	do	May 28, 1941
Iron ore	S and C*	President	Oct. 3, 1941
Iron and steel	S and C*	do	June 4, 1943
Jewel bearings	C*	A and NMB	Aug. 28, 1941
Kyanite	S and C*	President	Jan. 16, 1942
Lead (and ores)	S and C*	do	Apr. 17, 1941
Lithium minerals	S and C*	do	Oct. 28, 1942
Magnesite	S and C*	do	Feb. 6, 1942
Magnesium	S and C*	do	May 20, 1941
Manganese, ferrograde (and ores)	S	A and NMB	Jan. 30, 1940
Mercury (and ores)	S	do	Do.
Mica	S	do	Do.
Molybdenum (and ores)	S and C*	President	May 20, 1941
Monazite sand	S and C*	do	Sept. 5, 1941
Nickel (and ores)	S	A and NMB	Jan. 30, 1940
Nitrogen compounds (including ammonia, nitric acid, and Chilean nitrates).	C*	do	Dec. 4, 1940
Osmium	S and C*	President	Oct. 24, 1941
Palladium	S and C*	do	Do.
Petroleum and petroleum products	S and C*	do	July 9, 1943
Petroleum coke	S andC*	do	Nov. 6, 1942
Platinum (and platinum group) and ores	C	A and NMB	Jan. 30, 1940
Quartz crystal	S	do	Do.
Refractory brick	S and C*	President	July 10, 1943
Rhodium	S and C*	do	Oct. 24, 1941
Ruthenium	S and C*	do	Do.
Rutile	S and C*	do	Apr. 25, 1941
Scrap iron and steel	S and C*	do	Sept. 5, 1941
Sillimanite	S and C*	do	Jan. 16, 1942
Steatite talc	S and C*	do	Apr. 2, 1942

Footnotes at end of table.

Commodity[1]	Designation[2]	Designated by	Date
Strontium minerals	S and C*	President	Sept. 3, 1942
Tantalite	S and C*	do	Apr. 2, 1942
Tin (and ores)	S	A and NMB	Jan. 30, 1940
Topaz ore	S and C*	President	Apr. 13, 1943
Tungsten (and ores)	S	A and NMB	Jan. 30, 1940
Vanadium (and ores)	C	do	Do.
Zinc (and ores and zinc concentrates)	C*	do	Mar. 11, 1941
Zirconium (and ores)	S and C*	President	Apr. 25, 1941

[1] Materials in parentheses are included by implication.
[2] S—Strategic; C—Critical; S and C—Strategic and critical.

*Designated for purposes of procurement under 15 USC 606b (Public 664).
#Designated for purposes of procurement under 50 USC 98 (Public 117).

Since 1940 the strategic and critical material procurement program of the Government has been designed to build up substantial stock piles, in addition to supplying current needs, to provide a margin of safety for possible extreme emergencies. For some commodities, supplies of which were or could be threatened by enemy action, stock-pile goals originally were set as high as a 3-year supply. As the military outlook improved, stock-pile objectives were reduced, and during 1943 most plans called for the accumulation of not over a year's requirements. Early in 1944 the War Production Board established a formula for further reducing its stock-pile recommendations. Except where special considerations were involved, the formula calls for stock piles equal to 3 months of peak wartime consumption, or 1 year's war consumption minus the amount produced in North America, whichever is greater. The reserve stocks so determined are in addition to normal working inventories required by industry.

On March 6, 1944, the Army and Navy Munitions Board approved the following revised definition of strategic and critical materials:

> Strategic and critical materials are those materials required for essential uses in a war emergency, the procurement of which in adequate quantities, quality, and time is sufficiently uncertain for any reason to require prior provision for the supply thereof.

Formerly strategic and critical materials had been defined separately as follows:

> Strategic materials are those essential to national defense, for the supply of which in war dependence must be placed in whole, or in substantial part, on sources outside the continental limits of the United States; and for which strict conservation and distribution control measures will be necessary.
>
> Critical materials are those essential to national defense, the procurement problems of which in war would be less difficult than those of strategic materials either because they have a lesser degree of essentiality or are obtainable in more adequate quantities from domestic sources; and for which some degree of conservation and distribution control will be necessary.

The new simplified definition reflects war experience, which has shown that it is extremely difficult to differentiate between strategic and critical materials under the old formulas. Moreover, Congress had not recognized any distinction between them in the various laws it had passed to facilitate procurement of raw materials. The new formula, it should be noted, deemphasizes dependence on "sources outside the continental limits of the United States" as a factor in determining the strategic or critical nature of raw materials. Although the geography of mineral occurrence will continue to be the principal reason for uncertainty of supply in a war emergency, the revised definition permits classification of commodities as strategic and critical for other reasons, such as lack of production capacity. Magnesium, for example, is abundantly available at home in the mineral form, but the peacetime production capacity proved to be grossly inadequate for war requirements. Thus at the outset of the defense program its procurement became a major problem, and eventually magnesium achieved strategic status of a high order.

Strategic and critical raw materials differ in essentiality and availability. All are indispensable or highly essential for war needs. For some, however, substitutes can be used at not too great a sacrifice in cost and efficiency. These factors must be considered in procurement planning. For those materials not available domestically, stock-piling is the only means of guaranteeing emergency supplies. Where existing domestic resources or substitutes can be developed for war use at acceptable costs in manpower, materials, and money, stock piles may be needed only for the period required to get production or substitution under way. For perishable strategic and critical materials procurement planning is especially complicated.

Recognizing these basic differences the Army and Navy Munitions Board has divided strategic and critical materials under its new definition into three groups, according to the practicability of stock-piling, as follows:

> Group A comprises those strategic and critical materials for which stock-piling is deemed the only satisfactory means of insuring an adequate supply for a future emergency.
>
> Group B comprises additional strategic and critical materials, the stock-piling of which is practicable. The Army and Navy Munitions Board recommends their acquisition only to the extent they may be made available for transfer from Government agencies because adequacy of supply can be insured either by stimulation of existing North American production or by partial or complete use of available substitutes.
>
> Group C comprises those strategic and critical materials which are not now recommended for permanent stock-piling because in each case difficulties of storage are sufficient to outweigh the advantages to be gained by this means of insuring adequate future supply.

The Army and Navy Munitions Board lists of materials as determined under the new definitions are not available for inclusion in this report. It may be stated, however, that minerals comprise a substantial part of the commodities classified in each of the three groups. Such lists are of course subject to revision because they must indicate technologic changes in our industrial economy, changing techniques in warfare, and broad shifts in military strategy. In the field of minerals, discovery of new deposits and depletion of known ones, as well as technologic progress, are additional factors that will bring about revisions in the strategic and critical lists.

GOVERNMENT ORGANIZATION FOR WAR

Recent editions of Minerals Yearbook have presented a brief summary of the Government agencies administering the war program with a view to preserving a chronological record of the major changes in organization and key personnel that affect the mineral industries. Minerals Yearbook, 1942, presented the story up to July 1, 1943, and this review carries the record forward to June 1944. Details of the various actions taken by these agencies are given in the commodity chapters of this volume.

Although there were many internal changes in organization and rsonnel of the war agencies in the latter half of 1943 and the first half of 1944, on the whole the Government's war organization has remained relatively stable during the past year. The Office of Emergency Management continued as an administrative agency of the Executive Offices designed to maintain liaison between the President and the war agencies. The Office of War Mobilization is the top policy-making agency under the President and is responsible for coordinating and unifying the various war activities of the Government. It also acts in an adjudicating capacity to settle differences that develop among the war groups.

By Executive Order 9425 of February 21, 1944, there was created in the Office of War Mobilization a Surplus War Property Administration, to which was given general supervision and direction of the handling and disposition of surplus war property. In view of the uncertain status of post-war mineral stocks that now constitute a threat to the stability of the mineral markets, the actions of this agency will be watched with interest by the mineral industry. W. L. Clayton, formerly Assistant Secretary of Commerce, was named Administrator, and G. Temple Bridgman, former Executive Vice President of Metals Reserve Co., was appointed Deputy Administrator.

Another significant development was the creation of the Foreign Economic Administration, to which all foreign economic operations of the Government, including the development and procurement of foreign minerals, were transferred. The new agency is discussed briefly under a separate heading in this section and in the chapter entitled "International Aspects of War Mineral Procurement."

In addition to the Foreign Economic Administration, the major direction of the war program in minerals was lodged in the War Production Board, Petroleum Administration for War, Solid Fuels Administration for War, Coal Mines Administration, and Office of Price Administration. Major changes in these agencies during the past year are recorded in the discussion that follows.

War Production Board.—The War Production Board is the chief Government agency concerned with industrial production for war, including war administration of metals and the nonmetallic minerals other than fuels. The organization of the Board, as of July 1, 1943, was described in Minerals Yearbook, 1942, but since that time many changes have been made. The most notable of these with respect to the metals and minerals programs was the creation on December 27, 1943, of the Office of Vice Chairman for Metals and Minerals. Arthur H. Bunker, Director of the Aluminum and Magnesium Division since August of 1941, was named to the new post. The Steel, Copper, and Aluminum and Magnesium Divisions, the Minerals Bureau, except the Mining Division, the Minerals Resources Coordinating Division with its subsidiary committees, and the Premium Price Quota Committee were made responsible to the Metals and Minerals Vice Chairman. Early in 1944 Howard I. Young became Deputy Vice Chairman for Production of Metals and Minerals, and Samuel W. Anderson became Deputy Vice Chairman for Distribution of Metals and Minerals. At the same time the Minerals Bureau was abolished, and its component divisions, including the Mining Division, were made directly responsible to the Metals and Minerals Vice Chairman. The Office of Vice Chairman for Metals and Minerals thus included the following industry divisions:

- Aluminum and Magnesium Division
- Copper Division
- Cork, Asbestos, and Fibrous Glass Division
- Mica and Graphite Division
- Mining Division
- Miscellaneous Minerals Division
- Steel Division
- Tin and Lead Division
- Zinc Division

Various shifts in mineral personnel took place during the past year. Hiland G. Batcheller, who served as Director of the Steel Division from September 1942, was appointed Operations Vice Chairman in June 1943, replacing Donald Davis. He resigned and was succeeded by L. R. Boulware in November, at which time the Minerals Bureau and related committees were transferred to the Vice Chairman for Metals and Minerals. In November 1943, the Mining Division announced a western mining service designed to expedite handling of mine problems through eight field offices in addition to headquarters in Denver. J. Reed Lane was placed in charge of the project. Michael Schwartz succeeded H. O. King as Director of the Copper Division on February 1, 1944. Norman W. Foy replaced John T. Whiting as Director of the Steel Division in April 1944 and was later succeeded as Deputy Director by W. T. Todd. Several other major changes in personnel occurred during the year.

A further change in organization took place in May 1944. On May 8 William Y. Elliott, Director of the Division of Stock-Piling and Transportation, succeeded Arthur D. Whiteside as Vice Chairman for Civilian Requirements. The Division of Stock-Piling and Transportation became the Stock-Piling and Transportation Bureau, with Edward Browning, Jr., as Director. On May 27 Samuel W. Anderson succeeded J. A. Krug as Program Vice Chairman. His place as Deputy Vice Chairman for Metals and Minerals was not filled. May 25 saw the organization of a Production Executive Committee Staff under the direction of Executive Vice Chairman Charles E. Wilson, "to handle readjustments that grow out of changes in military production programs." Early in June Arthur H. Bunker became Vice Chairman of the Production Executive Committee and Director of the Production Executive Committee Staff. His place as Metals and Minerals Vice Chairman was taken by Philip D. Wilson, Director of the Aluminum and Magnesium Division.

As of July 1, 1944, the members of the War Production Board and the organization units and staff dealing with policy or administration affecting the mineral industries were as follows:

WAR PRODUCTION BOARD

Members

Chairman—Donald M. Nelson
Secretary of War—Henry L. Stimson
Secretary of the Navy—James V. Forrestal
Secretary of Commerce—Jesse H. Jones
Secretary of Agriculture—Claude R. Wickard
Lieutenant General in Charge of War Department Production—William S. Knudsen

Administrator, Office of Price Administration—Chester Bowles
Foreign Economic Administrator—Leo T. Crowley
Special Assistant to the President—Harry L. Hopkins
Chairman, War Manpower Commission—Paul V. McNutt
Director, Office of Defense Transportation—J. Monroe Johnson
Petroleum Administrator for War—Harold L. Ickes
War Food Administrator—Marvin Jones

Staff

- Executive Office of the Chairman
  - Office of War Utilities, Director—Edward Falck
    - Power Division, Director—B. J. Sickler
    - Manufactured-Gas Division, Director—Alexander Macomber
    - Natural-Gas Division, Director—Paul R. Taylor
  - Vice Chairman for Civilian Requirements—William Y. Elliott
    - Metals and Minerals Division, Director—Carroll Burton
  - Vice Chairman for Smaller War Plants—Maury Maverick
- Executive Vice Chairman—Charles E. Wilson
  - Deputy Executive Vice Chairman—Arthur H. Bunker
- Program Vice Chairman—S. W. Anderson
  - Requirements Committee, Chairman—S. W. Anderson
  - Program Bureau, Director—Lincoln Gordon
  - Orders and Regulations Bureau, Director—Thomas C. Blaisdell, Jr.
  - Production Controls Bureau, Director—Harold Boeschenstein
  - Distribution Bureau, Director—W. J. Logan
  - Bureau of Stock Piling and Transportation, Director—Edward Browning, Jr.
- Vice Chairman—Donald D. Davis
  - Deputy Vice Chairman for Field Operations—Harcourt Amory
  - Facilities Bureau, Director—John B. McTigue
  - Office of Production Research and Development, Acting Director—Donald B. Keyes
  - Procurement Policy Division, Director—Tudor Bowen
  - Bureau of Planning and Statistics, Director—Stacy May
- Vice Chairman (International Supply)—William L. Batt
- Vice Chairman for Labor Production—Joseph D. Keenan
  - Plant Productivity Division, Director—George W. Brooks
    - Raw Materials Section, Chief—William Munger
- Vice Chairman for Manpower Requirements—Clinton S. Golden
  - Labor Requirements Division, Acting Director—David Ziskind
    - Raw Materials Branch, Chief—Allen Buchanan
- Operations Vice Chairman—L. R. Boulware
  - Deputy Vice Chairman for Operations—Wade T. Childress
  - Office of Industry Advisory Committees, Director—John C. Whitridge, Jr.
  - Office of Product Assignments, Director—G. A. Stuart
  - Conservation Division, Director—Howard Coonley
  - Redistribution Division, Director—Col. Charles R. Baxter
  - Salvage Division, Director—Herbert M. Faust
  - Chemicals Bureau, Director—D. P. Morgan
  - Consumers Hard Goods Bureau, Acting Director—Wade T. Childress
  - Equipment Bureau, Director—William K. Frank
- Vice Chairman for Metals and Minerals—P. D. Wilson
  - Deputy Vice Chairman for Production—Howard I. Young
  - Aluminum and Magnesium Division, Acting Director—Thomas E. Covel
  - Copper Division, Director—Michael Schwartz
  - Mineral Resources Coordinating Division, Director—Howard I. Young
    - Minerals and Metals Advisory Committee, Chairman—Howard I. Young
      - War Department—Lt. Col. John A. Church
      - Navy Department—Comdr. J. W. Palen
      - Bureau of Mines—R. S. Dean
      - Reconstruction Finance Corporation—Simon D. Straus
      - Geological Survey—Donnel F. Hewett
      - Foreign Economic Administration—Alan M. Bateman
      - Bureau of Foreign and Domestic Commerce—Walter Janssen
      - Office of Civilian Requirements—Carroll Burton
      - Office of Production Research and Development—C. K. Leith
      - Facilities Bureau—Ellsworth R. Bennett

        Office of Manpower Requirements—Clinton S. Golden
        State-Department—C. E. Gamper
        Bureau of Stock-Piling and Transportation—Edward Browning, Jr.
    Minerals Resources Operating Committee, Chairman—Howard I. Young
        Bureau of Mines—R. S. Dean
        Foreign Economic Administration—Alan M. Bateman
        Reconstruction Finance Corporation—H. DeWitt Smith
        Office of Production Research and Development—Donald B. Keyes
Steel Division, Director—Norman W. Foy
    Deputy Director—W. T. Todd
    Asst. Director for Raw Materials and Facilities—H. J. French
        Plant Facilities Branch, Chief—H. W. Bryant
        Metallurgical Branch, Chief—E. J. Hergenroether
        Raw Materials Branch, Chief—Alex Miller
    Asst. Director for Production—C. H. Longfield
    Asst. Director for Program and Distribution—S. A. Crabtree
    Asst. Director for Manpower (Acting)—P. J. Clowes
    Asst. Director for Ferro-Alloys—E. Franklin Hatch
    Cork, Asbestos, and Fibrous Glass Division, Director—William T. Melov
    Mica-Graphite Division, Director—M. H. Billings
    Mining Division, Director—Arthur S. Knoizen
    Miscellaneous Minerals Division, Director—Richard J. Lund
    Tin and Lead Division, Director—Erwin Vogelsang
    Zinc Division, Director—James Douglas

Office of Price Administration.—The Stabilization Act of 1944 extended the authority for price controls 1 year to June 30, 1945. The act provided for some procedural changes and minor shifts in policies applicable to specified commodities. No changes in regard to mineral price policies were involved. However, moderate increases in ceiling prices for solid and liquid fuels were granted during the year. Very few increases were authorized for other minerals. The premium-price plan for copper, lead, and zinc continued in effect throughout 1943.

Chester A. Bowles succeeded Prentiss M. Brown as Administrator in October, and in August 1943 James F. Brownlee replaced Donald H. Wallace as Deputy Administrator for Price. As of July 1, 1944, the following units and executives of the Price Department were administering prices for minerals:

Industrial Materials Price Division:
    Director—John S. Clement
    Office of Metal Mining Analysis, Director—Jesse L. Maury
    Building Materials Branch, Price Executive—Karl Mathiason
    Nonferrous Metals Branch, Price Executive—Karl L. Anderson
    Iron and Steel Branch, Price Executive—Warren M. Huff
Industrial Manufacturing Price Division, Director—John S. Clement
    Chemicals and Drugs Branch, Acting Price Executive—Lester V. Chandler
Fuel Price Division, Director—Sumner Pike
    Petroleum Branch, Price Executive—Orville Judd
    Solid Fuels Branch, Price Executive—G. G. Johnson

Petroleum Administration for War.—This agency has continued to operate under the provisions of Executive Order 9276 of December 2, 1942; hence the primary purpose of administrative changes since January 1943 has been to adapt the organization to new conditions as they became apparent.

The most significant internal change in 1943 was a decentralization of authority by which power was delegated to the five district directors to act upon many operating problems. Under this system the judgment of men who are intimately acquainted with local conditions prevails with respect to questions of essentially local importance, and much of the delay and expense to operators attendant upon direct dealing with Washington has been eliminated.

Growing emphasis upon the foreign oil situation led to the creation of three divisions concerned with this field—The Production, Refining, and Supply and Transportation Divisions—in place of the old Foreign Division. Close relations are maintained with the Petroleum Board and the Foreign Petroleum Committee, both of which are interagency groups established in February 1943 to aid in the formulation and coordination of Government policy with respect to petroleum. A Foreign Operating Committee, similarly constituted, is concerned with the immediate problems involved in the supply of petroleum and products from foreign sources for the Allied armed forces.

The organization and principal officials of the Petroleum Administration for War on June 1, 1944 were as follows:

Administrator—Harold L. Ickes
Deputy Administrator—Ralph K. Davies
Assistant Deputy Administrator—Bruce K. Brown
Assistant Deputy Administrator and Chief Counsel—J. H. Marshall
Executive Officer—E. L. Kohler
Director of Organization Planning—W. H. Newman
Labor-Manpower Counselor—F. H. Harbison
Production Division—D. R. Knowlton, Director
Refining Division—E. D. Cumming, Director
Supply and Transportation Division—G. A. Wilson, Director
Distribution and Marketing Division—W. Hochuli, Director
Natural Gas and Natural Gasoline Division—J. E. Pew, Director
Foreign Production Division—W. B. Heroy, Director
Foreign Refining Division—C. S. Snodgrass, Director
Foreign Supply and Distribution Division—W. D. Crampton, Director
Materials Division—C. P. Parsons, Director
Facility Security Division—W. K. McCoy, Director
Research Division—E. B. Swanson, Director
Public Relations Division—S. W. Robinson, Director
Construction Division—George Gibson, Director
Program Division—S. P. Coleman, Director

In fulfilling its responsibilities to the armed forces and United States civilians the Petroleum Administration for War has guided the activities of the petroleum industry and integrated its policies and supply problems with the Nation's war program. The method by which supply and demand are coordinated is briefly sketched below.

To determine the total prospective demand for petroleum, the several cognizant agencies of Government certify monthly to the Petroleum Administration the future needs for petroleum products of the consuming activities controlled by each. The Petroleum Administration allocates the anticipated supply to the various consuming groups with necessary adjustments favoring the types of use regarded as most important to the prosecution of the war. The discrepancy indicated by forecasts of demand and supply is translated into operating adjustments within the petroleum industry designed to produce the quantity and quality of products required for all essential war purposes.

Solid Fuels Administration for War.—This agency was established within the Department of the Interior by Executive Order 9332 on April 19, 1943, to centralize the Government's programs and policies covering the supply of anthracite, bituminous coal, and lignite for essential war and civilian requirements. It succeeded the Office of Solid Fuels Coordinator for War (so designated on May 25, 1942), which had succeeded the Office of Solid Fuels Coordination for National Defense set up at the request of the President to the Secretary of the Interior on November 5, 1941.

On December 1, 1943, the War Production Board by Directive 33, together with a later amendment, delegated to the Solid Fuels Administration for War authority to regulate coke for distribution as a domestic fuel.

The Secretary of the Interior, as Solid Fuels Administrator for War, is authorized by the Executive order establishing S. F. A. W. to establish policies and formulate plans and programs to assure the most effective wartime distribution, conservation, and utilization of solid fuels, to issue necessary policy and operating orders, to appoint any necessary industry, committees, or councils, and to take appropriate steps for stimulating increased production.

The Solid Fuels Administration for War collects data from the solid fuels industries and other sources, both private and Government and, upon the basis of such data, makes recommendations to other Government agencies concerning prices, equipment, manpower, and transportation for the solid fuels industries.

The Administrator also has the power to determine the times and areas within which rationing of solid fuels should become effective; and he exercises, with respect to solid fuels and subject to the direction of the Chairman of the War Production Board, the allocation and rationing power of the President conferred by the Second War Powers Act, 1942.

Field offices have been established by the Solid Fuels Administration for War at key points throughout the major coal consuming areas to enable it to keep closely advised of the adequacy of the coal supply throughout the country in time to take any corrective action necessary.

Charles J. Potter succeeded Howard A. Gray (retired) as Deputy Administrator in November 1943, and in May 1944 the Economics and Statistics Division was transferred to the Bureau of Mines.

As of July 1, 1944, the organization of the Solid Fuels Administration was as follows:

Administrator—Harold L. Ickes
Deputy Administrator—Charles J. Potter
Consultant—Thomas J. Thomas
Consultant—James W. Morgan
Assistant Deputy Administrator for Transportation—Fred K. Prosser
Assistant Deputy Administrator for Coke—Harlen M. Chapman
Assistant Deputy Administrator for Prices, Manpower and Administration—Dan H. Wheeler
Special Assistant to the Deputy Administrator—Arnold Levy
Head Administrative Officer—John E. MacDonald
Chief, Anthracite Distribution Division—Robert F. Duemler
Chief, Bituminous Distribution Division—William F. Hahman
Chief, Coke Distribution Division—Samuel Weiss
Chief, Compliance Division—Charles H. Hayes
Chief, Conservation Division—Allen W. Thorson
Chief, Field Office Division—N. O. Wood, Jr.
Director of Information—Leonard W. Mosby
General Counsel—Jesse B. Messitte

Advisory bodies providing counsel to the Solid Fuels Administration include the following:

Solid Fuels Advisory War Council
National Anthracite Distribution Committee
Regional Anthracite Distribution Committees
Producer Advisory Boards for the 22 bituminous coal production districts
Lake Dock and Tidewater Dock Advisory Committees
National Advisory Coke Committee
National Committee on Local Distribution
Area Advisory Committees on Local Distribution
Community Committees on Emergency Distribution

Coal Mines Administration.—This agency was set up in July 1943 to supervise the operation of the anthracite and bituminous-coal mines in Government possession. The Secretary of the Interior, acting under authority of Executive Order 9340, on May 1, 1943, took over in behalf of the Government the coal-mining properties of 259 anthracite companies and 2,182 bituminous companies. These companies owned mines producing 50 tons or more per day and strikes had either halted or threatened to interrupt their output. During the initial period of Goverment possession the supervison of the mines was handled by the Solid Fuels Administration for War. Then the Secretary of the Interior established the Coal Mines Administration and transferred mine supervision to that agency.

The first period of Government possession was concluded on October 12, 1943, when all the mines then remaining in Government possession were returned.

Under authority of Executive Order 9393, the Secretary of the Interior again took possession of 3,223 mines belonging to 2,173 companies on November 1, 1943, after another Nation-wide series of strikes, and on November 3 concluded a Memorandum of Agreement with the United Mine Workers of America for the period of Government possession. After new agreements had been effectuated between the mine owners and mine labor, Government possession of the mines was gradually terminated, and on June 21, 1944, all the mines then remaining in Government possession, with the exception of two which belonged to one bituminous company, were turned back to their private owners.

Organization of the Coal Mines Administration during late 1943 and early 1944 was as follows:

Administrator—Harold L. Ickes
Deputy Coal Mines Administrator—Charles J. Potter
Assistant Deputy Administrator—Dan H. Wheeler
Assistant Deputy Administrator and Acting Associate Director Health and Safety Division—J. W. Morgan
Consultant—Harry G. Kennedy
Head Administrative Officer—J. E. MacDonald
General Counsel—Arnold Levy
Consultant, Labor Relations—Oral L. Garrison
Health and Safety Division—R. R. Sayers, Director
Health and Safety Division—Harrison Combs, Associate Director
Finance and Accounting Division—Joseph J. Mansolf
Information Division—Leonard W. Mosby, Chief

Foreign Economic Administration.—This agency, which was created by Executive Order 9380 issued on September 25, 1943, directs the vast foreign economic activities of the United States Government, including the procurement of minerals from abroad. The establishment of this agency culminated a series of consolidations, one of the most important of which was Executive Order 9361, issued on July 15, 1943, which merged in an Office of Economic Warfare the former Board of Economic Warfare, the Export-Import Bank, and various procurement subsidiaries of the Reconstruction Finance Corporation. The Office of Economic Warfare, the Office of Lend-Lease Administration, and other units dealing with foreign economic operations subsequently were brought together to form the Foreign Economic Administration. Leo J. Crowley was designated as Administrator.

The agency operates through two major bureaus—a Bureau of Supplies of which Sidney H. Scheuer is Executive Director and a Bureau of Areas directed by James L. McCamy. Mineral procurement is carried on in a Foreign Procurement and Development Branch, of which Paul H. Nitze is Director.

Negotiation of foreign minerals procurement contracts is handled by the F. E. A., and purchases are made in the name of its fiscal agent, United States Commercial Co., a United States Government-owned corporation. This has been true since September 1943 when the foreign procurement functions of Reconstruction Finance Corporation were transferred to United States Commercial Co. In general, Metals Reserve Co., an R. F. C. subsidiary, agreed to purchase foreign metals and minerals from United States Commercial Co. ex dock at United States ports of entry or f. o. b. cars at border points and to undertake the sale and distribution of such materials. This transfer signalized the completion of the withdrawal of the R. F. C. from the foreign minerals procurement field, with the exception of continued responsibility for several large development projects, financed by the Defense Plant Corporation.

With this exception, actual operations in the foreign minerals procurement field are conducted by the Metals and Minerals Divisions of the Foreign Procurement and Development Branch in the F. E. A. Key officials on the technical staff of these two divisions and of the associated Technical Services Division were as follows on July 1, 1944:

Associate Director of Foreign Procurement and Development Branch—Alan M. Bateman
Metals Division, Chief—Spencer S. Shannon
    Copper Section, Chief—Mahlon Miller
    Zinc-Lead Section, Chief—Vacancy
    Tin, Mercury, Antimony, Bauxite Section, Chief—Clarence E. Peterson
    Ferro-Alloy Section, Chief—Horace J. Fraser
    Scrap Metals Section, Chief—Benjamin Schwartz
Minerals Division, Chief—David C. Sharpstone
    Minerals Division, Assistant Chief—Hugh E. McKinstry
    Mica-Graphite Section, Chief—Richard H. Vail
    Quartz-Optical Calcite Section, Chief—Carl Tolman
    Asbestos, Fluorspar, Diamonds Section, Chief—Henry A. Behre
    Rare Minerals Section, Chief—James S. Baker
    Alloy Minerals Section, Chief—Vacancy
Technical Services Division, Chief—Vacancy
    Economic and Area Liaison Section, Chief—John W. Evans
    Engineering Analysis and Commodity Section, Chief—Robert K. Warner
    Service and Supply Section, Chief—Paul Hendrick

INTERNATIONAL ASPECTS OF THE WAR MINERAL PROGRAM

By J. S. McGrath

GENERAL SUMMARY

International economic relations during 1943 continued to be influenced to a major degree by the necessities of war. However, toward the end of the year cooperative arrangements among the United Nations with respect to distribution of available supplies essential to wartime operations had been so successful that serious consideration of readjustments to minimize post-war problems became imperative. This applied particularly to the mineral production and development program. Output of many mineral raw materials reached a peak during 1943, and in most instances the available supplies were adequate to meet anticipated requirements far into 1944. This situation applied to the United States and its Allies as well as to neutral countries with which the Allies maintained friendly relations. For a few minerals, surpluses developed during the year or at the stimulated rate of production could be anticipated. This trend toward an excess over wartime needs led to discussions in official and industrial circles of national policies relating to controls of mineral production, import regulations, stock-piling programs, and necessary adjustments of existing Government-to-Government agreements originally enacted for the primary purpose of acquiring strategic and critical raw materials. Consideration also was given to the need for post-war international cooperation through some form of organization that may effectively prevent the collapse of free enterprise as this term relates to article IV of the Atlantic Charter, which seeks equal access by all nations or the trade and raw materials of the world that are essential to theit economic welfare.

Control of mineral production and imports.—Except during war emergencies, the mining industry of the United States has been singularly free from direct Government restrictions or controls on production. Export controls—a device used in many countries for various purposes—have been nonexistent in the United States in times of peace. In recent years some control of petroleum and bituminous-coal production has accompanied the Government attempt to effect conservation practices or achieve greater stability in those industries. Although rigid control of mineral resources has been proposed from time to time as a conservation measure, it has never been adopted as national policy. The prospect of United States participation in international economic cooperation presupposes a large measure of control, particularly over those commodities that enter world trade in substantial quantities. As minerals comprise a very important part of the foreign trade of the United States and as some measure of post-war international collaboration seems assured, more active participation in the affairs of the mining industry by the Government likewise seems inevitable.

Interrelated with potential production and export controls is the consideration of adjustments in tariff policy, which must be treated as a complementary problem. That industry is cognizant of the seriousness of the post-war conditions that will confront producers and fabricators of mineral raw materials as well as Government may be gleaned from an editorial in Engineering and Mining Journal, December 1943 (pp. 76–82) directing attention to "Important Factors in the Outlook for Mining," and an article by Evan Just, associate editor, Engineering and Mining Journal, that suggests a "National Policy on Mineral Imports," April 1944 (pp. 70–73). Both references stress the inescapable complications that must be faced during the post-war period of transition from a wartime to a peacetime economy. Particular emphasis is placed on the need for adopting a national policy that will assure access by industry to necessary raw materials from domestic or from foreign sources, whichever may be obtainable upon the most economic basis. Some form of quota system is suggested, which would allocate tonnages to be supplied from domestic and foreign sources. A workable formula of such a system would involve detailed analyses of each industry and careful study of and ultimate decisions relating to the capacity of domestic producers to supply and the United States market to consume, comparative production costs, and problems concerning depletion of domestic reserves, conservation of dwindling resources, and competitive substitutes. The practicability of such a quota system has already been explored and applied to certain commodities involved in the trade agreements program initiated by the United States 10 years ago.

Stock-pile proposals.—Stock-piling of essential metals and minerals, as a wartime necessity, has been in effect since 1939, under Congressional authority (Public 117, 76th Congress). For peacetime stability, numerous proposals were studied throughout 1943 by the Congress, by the United States departments of War, Navy, State, and the Interior, and by the Foreign Economic Administration. However, differences of opinion relating to administrative details of the program and the extent of preference that should be given domestic and foreign sources of supply precluded adoption during 1943 of any suitable form of legislation. Details concerning some of the stock-piling proposals will be found elsewhere in the Yearbook.

Significance of wartime imports.—Detailed statistics of domestic production during 1943 and data relating to imports essential to meet industrial requirements will be found in the commodity chapters of Minerals Yearbook. The evident dependence of this country on foreign sources of supply for a substantial part of its wartime needs and the obligation to consider seriously the future effect of the wartime demands of the United Nations upon sources of supply within the Western Hemisphere are clearly indicated by the large increases in imports of certain essential materials into this country in 1943 over any pre-war year, as, for example, 1938. The increase in imports of manganese ore in 1943 was about 158 percent and of chrome ore 135 percent; imports of aluminum and bauxite, copper, lead, zinc, tungsten ores, nickel in various forms, vanadium ore, antimony, and mercury showed similar marked increases in 1943 compared with 1938. These comparisons, though exaggerated by war conditions, evidence a declining self-sufficiency in minerals in the United States and indicate the wide variety of post-war problems that will confront management, labor, and Government in this country. Substantial curtailment of war demands at the close of this war will adversely affect the principal producing nations of this hemisphere because the Government-to-Government agreements enacted during 1942 and 1943 greatly stimulated their output of minerals and contributed to the improvement of their internal economies. This applies especially to the Latin American countries.

GOVERNMENT-TO-GOVERNMENT AGREEMENTS FOR THE ACQUISITION OF MINERAL RAW MATERIALS

The primary purposes for negotiating over-all agreements between this country and other nations of the Western Hemisphere were to assure our industries adequate supplies of vital strategic materials and to prevent the procurement of such raw materials by enemy countries. Since January 1943 three of the four original over-all Government-to-Government agreements have been renewed with Chile, Mexico, and Peru, and the original agreement with Brazil was extended to September 15, 1944, insofar as it relates to quartz crystal and mica purchases.

Chile.—The initial agreement between the Governments of the United States and Chile, which was negotiated for the primary purpose of acquiring copper, expired July 19, 1943, but was extended to August 1, 1944, by an exchange of diplomatic notes. The agreement has flexible provisions relating to purchases, deliveries, and prices f. o. b. steamer Chilean ports of copper ores and concentrates, lead ores and concentrates, zinc ores and concentrates, gold ores and concentrates, manganese ore, mercury, antimony ores, cobalt ores and concentrates, molybdenum ores and concentrates, and tungsten ores and concentrates. Purchases during the year ending August 1944 are limited to specified tonnages. The Chilean Government agreed to restrict exportation of these strategic minerals to the United States, the British Empire, and other countries of the Western Hemisphere that have satisfactory systems of export control and to limit domestic consumption of copper and manufactures thereof to specified tonnages which precludes its use for unessential purposes.

Mexico.—Through an exchange of diplomatic notes concluded on June 30, 1943, the original Mexican over-all agreement of July 15, 1941, and its amendment of April 29, 1942, were superseded by an arrangement that provides for the purchase by the United Nations of exportable surpluses of all strategic minerals from Mexico included in the original amendment. It also carries the provision that the agreement will remain in effect until April 29, 1944, and thereafter unless terminated by either Government on 6-months' notice. The minerals covered by the agreement, whether in ore, concentrates, or metallic form, include antimony, arsenic, bismuth, cadmium, cobalt, copper, fluorspar, graphite, lead, manganese, mercury, mica, molybdenum, tin, tungsten, vanadium, and zinc.

Peru.—In January 1943 a draft of an agreement between the United States and Peru was submitted that would have extended the original agreement with Peru that expired on September 29, 1941, after having been in effect for 1 year. Differences of opinions concerning certain tax policies of the proposed agreement resulted in protracted discussions, and Peruvian mineral producers and exporters during the first few months of 1943 were directly and adversely affected. Finally, on July 20, 1943, an accord between the two countries was reached effective until June 30, 1944. The agreement provides for the purchase by this country, the British Empire, and any American republics that have a satisfactory system of export control, of copper ores and concentrates, lead ores and concentrates, gold contained in complex ores, zinc metal, ores and concentrates, mercury, tungsten ores and concentrates, molybdenum ores and concentrates, and antimony ores and concentrates, all of which materials are specifically provided for as to grades and purchase prices.

Other agreements.—An agreement with Colombia for a year's purchase of platinum was negotiated in March 1942. In March 1943 the original contract was renewed with some revisions relating to crude platinum, the entire Colombian output of which was for shipment to the United States until expiration of the agreement on March 17, 1944.

On October 22, 1940, 5-year contracts were signed between the National Resources Commission, an agency of the Republic of China, and the Metals Reserve Co., representing the United States Government, which were negotiated for the dual purpose of providing a loan of $25,000,000 by this country to China and the acquisition by this country of Chinese tin, tungsten, and antimony; a second contract for the purchase of these strategic metals over a period of 7 years, involving a loan of $50,000,000 to China, was signed January 31, 1941. The second contract was amended for the fourth time on January 4, 1943, in an endeavor to speed deliveries of badly needed tin and tungsten to the United States.

ECONOMIC WARFARE PROGRAM

Agencies created to prosecute economic warfare.—Many Government agencies have contributed to the wartime foreign production and procurement program, and there have been several reorganizations and mergers of such offices. Some Federal organizations created "to produce, acquire, and carry strategic and critical materials as described by the President" were established by the Congress through specific legislation, whereas others were created by Executive order. Public 664, 76th Congress, 3d session, approved June 25, 1940, and an amendment thereto (Public 108, 77th Congress, 1st session, approved June 10, 1941) authorizing the Reconstruction Finance Corporation to organize and finance corporations for the purpose of purchasing essential raw materials, is an illustration of the former type of legislative authorization. The several agencies created by Executive order before 1943 that were authorized to participate in one phase or another of the wartime production and procurement program are described in the chapter on this subject that appears in Minerals Yearbook, 1942.

On July 15, 1943, the Office of Economic Warfare was established by Executive Order 9631. To it were transferred all the functions of the former Board of Economic Warfare and those of the United States Commercial Co., the Rubber Development Corporation, Petroleum Reserves Corporation, and the Export-Import Bank, with the functions and responsibilities of those subsidiaries of the Reconstruction Finance Corporation that were directed toward foreign production and procurement activities. To consolidate further all agencies directly responsible for the existing relief, rehabilitation, and development and procurement programs, the Foreign Economic Administration was established by Executive Order 9380 on September 25, 1943. The Administration represents a consolidation into one administrative organization of the former Office of Lend-Lease Administration, Office of Foreign Relief and Rehabilitation Operations, Office of Economic Warfare (including those agencies aforementioned), and that part of the Office of Foreign Economic Coordination, United States Department of State, which formerly was responsible in part for Government-to-Government negotiations. By the end of 1943 it appeared reasonably certain that, for the duration of the war, the war-mineral program of this country with respect to the procurement and development of vital materials abroad would remain a function and responsibility of the Foreign Economic Administration.

Iron ore and coal are the only major war minerals which the United States has been able to supply from domestic sources in adequate volume to meet its wartime requirements, consequently metals and minerals represent the largest commodity group in the foreign procurement and development program initiated by this country some time before hostilities began in December 1941. During 1943 the program extended to the Caribbean area, Mexico, Central America, all but two of the countries of South America, several parts of Africa, India, China, Australia, and the South Pacific.

According to the Foreign Economic Administrator, deliveries of strategic commodities from foreign countries purchased with United States Government funds during 1943 were valued at $809,000,000, of which $496,000,000 or 61.3 percent represented expenditures for mineral purchases. These figures do not include purchases or deliveries made under the auspices of the Foreign Economic Administration for private account or purchases made under the preclusive buying policy adopted for the purpose of preventing delivery to the enemy of essential raw materials produced in neutral countries. Government purchases during the year included many imported mineral commodities, such as beryl, chrome, copper, fluorspar, manganese, mica, nickel, quartz crystal, tantalite, tin, and zinc.

GENESIS OF CURRENT TREND TOWARD INTERNATIONAL ECONOMIC COLLABORATION

The Atlantic Charter.—The fourth article of the joint declaration of the President of the United States and the Prime Minister of Great Britain, commonly known as the Atlantic Charter, dated August 14, 1941, provides that members of the United Nations, including all countries that have since that date subscribed to the original declaration "will endeavor, with due respect for their existing obligations, to further the enjoyment by all States, great or small, victor or vanquished, of access on equal terms to the trade and to the raw materials of the world which are needed for their economic prosperity."

First joint declaration of the United Nations.—On January 1, 1942, the 27 countries then comprising the United Nations subscribed to a joint declaration, the purpose of which was to insure maximum cooperation in the war effort and which pledged employment of "full resources, military and economic," against the enemy.

The Moscow Conference.—Articles IV and V of a general security pact signed at Moscow on October 30, 1943, by Secretary of State Cordell Hull and corresponding officials representing the Governments of the United Kingdom, the Soviet Union, and China, provides that these Nations

> Recognize the necessity of establishing at the earliest practicable date a general international organization, based on the principle of the sovereign equality of all peace-loving States and open to membership by all such States, large or small, for the maintenance of international peace and security; that for the purpose of maintaining international peace and security pending the reestablishment of law and order and the inauguration of a system of general security, they will consult with one another and as occasion requires with other members of the United Nations with a view to joint action on behalf of the community of nations.

The Tehran Conference.—At the capital of Iran on December 1, 1943, the Tehran declaration was signed by the President of the United States, the Prime Minister of Great Britain, and the Premier of the Soviet Union. In this document they acknowledged the

> responsibility resting upon us and all the United Nations to make a peace which will command the good will of the overwhelming mass of the people of the world;

it was also declared that

> We shall seek the cooperation and active participation of all nations, large or small * * * and will welcome them as they may choose to come into a world family of Democratic Nations.

PLANNING FOR POST-WAR ECONOMIC COLLABORATION

The war program has emphasized many factors that probably will present international post-war problems of major significance. These developments, in the light of the apparent determination both here and abroad to devise some practical means of achieving collective security through international cooperation, focus attention on the importance of foreign policy in our future mineral economy. They also indicate clearly the need for prompt consideration of these problems in this country and abroad under Government and private auspices which may lead to the adoption of policies that can at least minimize destructive post-war competition for international markets upon which the economy of so many countries depends.

Although the principle of international cooperation on a broader scale than before the war is endorsed by the United Nations, as previously indicated, nothing concrete developed in the form of a definite program either in this country or abroad during 1943 or the early part of 1944. In this country congressional delegations have been appointed to confer with the United States Department of State to insure harmony between the legislative and executive branches of Government on matters relating to post-war planning. Congressional committees, as well as similar groups in several executive departments have been set up to conduct studies and consider proposals relating to economic and political aspects of international arrangements that may ultimately serve as the basis for international discussions of post-war problems. A similar situation prevailed at the outset of 1944 in most of the United Nations.

Discussions on an international scale have been held with respect to post-war planning of food distribution and monetary problems, and in regard to food distribution and health of nationals of war-torn countries an international organization has been created to cope with the problem (United Nations Relief and Rehabilitation Administration). However, no intergovernmental action has been taken with respect to minerals, with the single exception of exploratory discussions on petroleum between the United States and the United Kingdom in April 1944. These discussions were predicated on the recommendation by both countries that adequate petroleum supplies must be available for free international trade to insure the security and prosperity of all nations; that for the foreseeable future, petroleum resources of the world must assure ample supplies to meet market requirements; and that the anticipated increase in world demand for petroleum products must be satisfied by the orderly flow in international trade of petroleum from the various producing countries of the world. Similar discussions relating to other mineral products may be anticipated.

The gravity of inescapable problems confronting domestic producers at the outset of 1944, which to some degree are common to all countries where mineral output is a major factor in the internal economy, is recognized both in Government and in private industrial circles. Responsibility of the major powers for maintaining world stability in the sense of national security for all countries and the relationship to this problem of access to and balanced distribution of mineral raw materials through political or economic control of mineralized areas has received considerable attention since the end of World War I.

To statesmen and industrial leaders in this country and abroad it appears evident that at the conclusion of the present conflict Government control or regulation of mineral production and distribution in one form or another will be adopted by many countries. Trends in this direction or at least indications that serious thought is being given to the relationship between control of mineral resources and post-war security and national prosperity is evidenced by the movement toward international economic collaboration among the United Nations which began late in 1943 and has become more pronounced as victory for the Allies seems assured. Although the principle involved is recognized as a post-war necessity, no definite plans have as yet crystallized. However, discussions in official circles in the United States include proposals to rejuvenate the Reciprocal Trade Agreements Act enacted by the

Congress in 1934 for a period of 3 years but extended on three occasions and now in effect until June 1945. Agreements were negotiated under this act before Pearl Harbor between the United States and 27 foreign countries. Negotiations with Bolivia, Paraguay, Chile, Italy, and Spain were postponed for the duration of the war. Reduction of excessive trade restrictions, chiefly prohibitive import duties, which is the fundamental principle of the act, has been suggested as a possible theme upon which the United Nations might develop a formula of collaboration for the settlement of problems of discriminatory exchange regulations and taxation practices, restrictions and prohibitions on foreign investments, and the activities of international cartels and monopolies that hamper the full development of technologic improvements.

STATISTICAL SUMMARY OF MINERAL PRODUCTION

(GENERAL UNITED STATES SUMMARY AND DETAILED PRODUCTION BY STATES)

By MARTHA B. CLARK AND MARIAN E. MEYER

SUMMARY OUTLINE

	Page		Page
Introduction	31	General tables	33
Unit of measurement	31	State tables	45
Elimination of duplication	31		

INTRODUCTION

This report continues the series of annual statistical summaries published in previous years as chapters of Mineral Resources and Minerals Yearbook.

In order to meet the need of industry and the States for up-to-date statistics on State production of minerals, State summaries are presented for the current year for the first time since 1931, after which the Minerals Yearbook series was established. This speeding up of the compilation of State data is possible as steady progress has been made in statistical techniques in recent years. Because of the early date of publication, the fuel figures for 1943 are estimates subject to revision; it is believed, however, that the data shown represent a high order of accuracy.

UNIT OF MEASUREMENT

The unit of measurement used by the Bureau of Mines for each mineral product in reports on the mineral resources is that common to the industry concerned, and the variation in these units makes it impracticable, if not impossible, directly to combine and compare the different minerals except as to value. Although most of the products are measured by weight, some are measured by volume and some by number of "pieces," etc.; for some no total quantity figures are available.

ELIMINATION OF DUPLICATION

In the totals for the United States, shown in the following "general" tables, duplication has been eliminated wherever practicable, and in the State totals given in the State tables virtually all duplication has been eliminated. For instance, in both general and State tables the output of coke is shown but its value is not included in the totals, as the value of the coal used in its manufacture enters into the value of the coal production which is included in the totals. For asphalt, both native and oil are shown in the general tables, but the value of the oil asphalt is excluded from the totals as it duplicates that of the petroleum from which it is manufactured. For the clay industries, no figures have been available for total clay produced. For years before 1936, the total value of clay products is included in both general and State totals as representing the first marketable form of the greater part of the clay produced; the quantity and value of the clay mined and sold in the raw state by miners to users of clay are shown separately also, but the value is not included in the totals as it is duplicated largely in that for clay products. For years beginning with 1936, as the Bureau of Mines believes that a closer approach to the value of domestic clay in its first marketable form results from the inclusion of the value of clay sold by producers and of clay products other than pottery and refractories, the United States and State totals include such values for the clay industries. This change in practice should be borne in mind when comparing the values beginning 1936 with those for earlier years.

United States totals.—In the general tables both iron ore and pig iron are shown, but the value of the pig iron rather than the iron ore is included in the United States totals, as that is considered the better means of presenting the statistics for iron in its first marketable form. For gold, silver, copper, lead, and zinc the value of "smelter output" is included in the general totals, and to account more fully for the value of the ores treated these smelter figures are supplemented by the value of the byproduct sulfuric acid. The value of pigments (white lead, red lead, lithopone, litharge, and orange mineral) manufactured from metals is not included in the general tables, as the base from which they are made is included in the output of lead or zinc, whereas the value of sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide is included, as these are made in large part direct from the ores and do not enter into the lead or zinc totals, which represent smelter output.

State totals.—In the State tables also iron ore and pig iron are both shown. As blast-furnace products cannot be traced to the States in which the ore is mined, the value of the ore is used in the State totals. For ores of gold, silver, copper, lead, and zinc no values are shown, and in fact none are recorded; instead, for each of these metals the recoverable content of the ores is used as the basis of valuation. The value of the zinc and lead pigments is not included in the State total, as the recoverable zinc and lead content of the ores from which the products were made is included under zinc or lead. The value of the sulfuric acid produced as a byproduct of copper, lead, and zinc smelting and zinc roasting is not included in the State total, as tracing this product back to the State producing the ore has not been possible.

GENERAL TABLES

Mineral products of the United States, 1941–43[1]

Product	1941		1942		1943	
	Quantity	Value	Quantity	Value	Quantity	Value

Mineral products of the United States, 1941–43—Continued

Product	1941		1942		1943	
	Quantity	Value	Quantity	Value	Quantity	Value
METALLIC—continued						
Selenium ... pounds	681,650	(12)	316,613	(12)	521,779	(12)
Silver [13] ... troy ounces	72,336,029	$51,438,954	56,090,855	$39,886,830	40,820,639	$29,028,010
Tantalum and columbium ores ... pounds	250	219	(4 5)	(4 5)	(4 5)	(4 5)
Tellurium ... do	239,983	(12)	98,798	(12)	62,260	(12)
Tin (metallic equivalent) ... short tons	63	65,600	(4 5)	(4 5)	(4 5)	(4 5)
Titanium concentrates:						
Ilmenite ... do	21,526	196,522	93,397	1,805,823	211,715	3,738,970
Rutile ... do	3,431	493,782	2,649	410,956	3,911	610,879
Tungsten ore (60 percent concentrates) ... do	6,567	9,223,726	(4 5)	(4 5)	(4 5)	(4 5)
Vanadium ... pounds	2,513,051	1,179,500	(4 5)	(4 5)	(4 5)	(4 5)
Zinc,[6] sales value ... short tons	652,599	97,890,000	629,957	[7] 109,613,000	594,250	[7] 102,211,000
Other metallic [14] ...		2,031,953		3,643,356		3,276,533
Total value of metallic products (approximate) ...		2,132,000,000		2,363,300,000		2,493,000,000
NONMETALLIC						
Arsenious oxide ... short tons	34,784	1,119,320	(4 15)	(4 15)	(4 15)	(4 15)
Asbestos ... do	24,391	725,753	(4 15)	(4 15)	(4 15)	(4 15)
Asphalt:						
Native ... do	691,168	3,169,193	975,373	4,279,442	886,135	4,288,488
Oil (including road oil)[9] ... do	6,267,688	[9] 55,510,338	(4 9)	(4 9)	(4 9)	(4 9)
Barite (crude) ... do	503,156	3,134,234	429,484	2,673,002	420,343	2,796,776
Boron minerals ... do	301,282	6,785,662	226,723	5,733,648	256,633	6,401,507
Bromine ... pounds	68,317,019	11,506,213	65,880,935	13,729,383	94,085,937	19,107,065
Calcium-magnesium chloride (75 percent $CaCl_2$) ... short tons	165,932	1,333,370	224,527	1,733,169	199,796	1,549,565
Cement ... barrels (376 pounds net)	170,365,440	250,589,481	187,809,208	286,905,197	129,478,662	202,460,328
Clay:						
Products (other than pottery and refractories) ...		[16] 135,000,000		[16] 102,740,000		[16] 75,200,000
Raw (sold by producers) ... short tons	7,018,056	24,925,717	7,342,843	24,523,227	7,108,965	24,786,924
Coal:						
Bituminous [17] ... do	514,149,245	1,125,362,836	582,692,937	1,373,990,608	589,043,000	1,568,597,000
Pennsylvania anthracite ... do	56,368,267	240,275,000	60,327,729	271,673,000	60,643,620	306,816,018
Coke [9] ... do	65,186,578	[9] 352,967,237	70,568,944	[9] 425,613,744	71,676,063	[9] 476,117,472
Diatomite ... do	(18)	(18)	(18)	(18)	(18)	(18)
Emery ... do	4,876	42,484	6,277	49,413	6,666	63,195
Feldspar (crude) ... long tons	338,860	1,519,456	316,166	1,546,702	308,180	1,646,277
Fluorspar ... short tons	320,669	6,724,782	360,316	8,897,749	406,016	11,802,255
Fuller's earth ... do	207,446	2,111,674	204,244	2,139,670	271,667	2,867,808
Garnet for abrasive purposes ... do	5,501	371,752	4,357	299,904	5,935	429,120
Gems and precious stones ...		(19)		(19)		(19)

Graphite:						
Amorphous .... short tons	(18)	(18)	7,253	401,690	9,597	908,102
Crystalline .... pounds	(18)	(18)				
Grindstones and pulpstones .... short tons	15,536	545,556	14,681	539,739	12,623	488,205
Gypsum (crude) .... do	4,788,534	6,794,223	4,697,568	6,811,180	3,877,541	5,959,615
Helium [20] .... cubic feet	16,173,430	(18)	(18)	(18)	(18)	(18)
Iodine .... pounds	(18)	(18)	(18)	(18)	(18)	(18)
Kyanite .... short tons	8,335	175,581	8,708	190,750	9,561	288,649
Lime .... do	6,079,416	42,941,162	6,103,791	44,867,441	6,596,615	49,064,828
Lithium minerals .... do	3,832	115,718	5,405	242,516	8,155	314,660
Magnesite (crude) .... do	374,799	2,655,547	497,368	3,874,334	754,832	6,071,596
Magnesium compounds (natural) (including brucite) .... pounds	274,714,000	3,587,784	738,514,000	10,727,560	1,226,148,000	21,605,241
Marl:						
Calcareous .... short tons	183,009	175,398	194,878	135,046	147,153	152,821
Greensand .... do	11,120	619,664	10,110	448,440	10,056	522,124
Mica:						
Scrap .... do	32,500	442,789	(4 18)	(4 18)	(4 18)	(4 18)
Sheet .... pounds	2,666,453	566,858	(4 18)	(4 18)	(4 18)	(4 18)
Millstones	--------	15,579	--------	10,391	--------	9,240
Mineral pigments:						
Natural pigments and manufactured iron oxide pigments short tons	(21)	(21)	97,327	7,764,232	100,666	8,029,057
Zinc and lead pigments [22] .... do	228,123	27,994,694	156,215	21,255,125	192,827	26,340,947
Mineral waters .... gallons sold	(19)	(19)	(19)	(19)	(19)	(19)
Natural gas .... M cubic feet	2,812,658,000	621,333,000	3,053,475,000	692,737,000	3,349,586,000	753,810,000
Natural gasoline and allied products:						
Natural gasoline and cycle products .... gallons	2,688,714,000	105,815,000	2,725,968,000	102,565,000	2,708,538,000	121,000,000
Liquefied petroleum gases .... do	707,196,000	18,305,000	773,556,000	19,000,000	994,980,000	26,000,000
Oilstones, etc .... short tons	(18)	(18)	(18)	(18)	(18)	(18)
Olivine .... do	4,828	24,401	5,739	45,201	5,415	48,633
Peat .... do	86,503	657,556	71,500	516,887	60,002	491,460
Petroleum .... barrels (42 gallons)	1,402,228,000	1,602,000,000	1,386,645,000	1,643,470,000	1,503,176,000	1,812,560,000
Phosphate rock .... long tons	4,689,652	15,596,273	4,644,240	16,597,492	5,126,232	18,962,021
Potassium salts .... short tons	[23] 531,346	17,368,237	[23] 680,831	22,962,518	[23] 732,151	26,183,073
Pumice .... do	117,310	669,514	126,522	706,199	85,150	611,495
Pyrites .... long tons	645,257	2,009,000	720,363	2,464,000	802,384	2,844,000
Salt (sodium chloride) .... short tons	12,720,629	33,620,376	13,693,284	38,144,234	15,214,152	43,878,266
Sand and gravel:						
Glass sand .... do	3,475,111	6,113,529	3,622,487	6,784,427	3,971,931	7,376,566
Sand (molding, building, etc.) and gravel .... do	285,240,000	141,093,000	300,724,000	181,716,000	230,092,000	145,416,000
Silica (quartz) .... do	41,685	228,587	65,878	331,494	99,445	346,558
Slate .... do	618,660	7,515,634	590,770	6,360,223	468,860	4,870,237
Sodium salts (carbonates and sulfates) (natural) .... do	304,201	3,266,123	325,652	3,815,272	331,901	4,097,635
Stone [24] .... do	183,107,960	195,837,426	195,884,490	205,002,019	171,343,250	184,820,034
Sulfur .... long tons	3,401,410	54,400,000	3,128,559	50,100,000	2,953,845	47,800,000
Sulfuric acid (60° Baumé) (byproduct) [25] .... short tons	915,989	7,201,161	960,764	8,253,104	1,195,707	10,270,009
Talc, pyrophyllite, and ground soapstone [24] .... do	416,369	4,701,892	387,963	4,754,076	412,868	5,121,414
Tripoli .... do	29,301	421,746	17,536	272,428	14,912	244,365

---

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1943 are subject to revision. For details see following chapters of this volume.

[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.

[3] Largely from foreign ore; value not included in total value.

[4] Figures withheld from publication in accordance with censorship regulations.

[5] Value included in total value of metallic products.

[6] Product from domestic ores only.

[7] Value does not include premiums paid to miners by the Government. Total premiums for copper, lead, and zinc amounted to approximately $26,000,000 in 1942 and $68,000,000 in 1943.

[8] According to Bureau of the Mint. Valued at $35 per ounce.

[9] Value not included in total value.

[10] Figures not available.

[11] Figures showing values not available.

[12] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.

[13] According to Bureau of the Mint.

[14] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1941: Bismuth, cobalt, indium, iron ore sold for paint (20,792 long tons, $101,710), radium, thallium, uranium compounds, and zircon (174 short tons, $5,153).

1942: Bismuth, cobalt, germanium, indium, radium, thallium, and zircon.

1943: Bismuth, cobalt, germanium, indium, thallium, and zircon.

[15] Value included in total value of nonmetallic products.

[16] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[17] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

[18] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.

[19] No canvass. Estimate of value included in total value of nonmetallic products.

[20] Figures cover fiscal year ended June 30 of year stated.

[21] Canvass discontinued after 1915. Figures for iron ore sold for paint given in footnote 14.

[22] Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.

[23] Equivalent as K_2O.

[24] Figures for soapstone used as dimension stone included in figures for stone.

[25] From copper, lead, and zinc smelters and zinc roasters.

[26] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1941: Andalusite, crude aplite, natural sulfonated bitumen, chats (5,291,491 short tons, $897,940), dumortierite, flint lining for tube mills (3,411 short tons, $54,216), pebbles for grinding (13,561 short tons, $221,826), silica sand and sandstone (ground) (487,665 short tons, $3,073,730), strontium minerals (4,724 short tons, $69,054), sulfur ore (409 long tons, $2,553), and industrial topaz.

1942: Andalusite, crude aplite, natural sulfonated bitumen, dumortierite, flint lining for tube mills (2,576 short tons, $49,967), pebbles for grinding (15,487 short tons, $245,794), silica sand and sandstone (ground) (527,886 short tons, $3,646,643), strontium minerals (4,041 short tons, $55,529), sulfur ore (1,590 long tons, $16,000), and industrial topaz.

1943: Andalusite, crude aplite, natural sulfonated bitumen, calcite (Iceland spar), corundum, dumortierite, flint lining for tube mills (2,585 short tons, $46,071), pebbles for grinding (9,924 short tons, $157,778), quartz crystal, silica sand and sandstone (ground) (541,350 short tons, $3,937,452), strontium minerals (7,566 short tons, $114,526), sulfur ore (2,572 long tons, $26,215), industrial topaz, and wollastonite.

Value of mineral products of the United States, 1880–1943 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190,881,000	$120,241,000	$56,341,000	$176,582,000	$367,463,000
1881	192,663,000	149,798,000	60,659,000	210,457,000	403,120,000

---

[1] Figures for earlier years not available.

[2] Coal, natural gas, natural gasoline and allied products, petroleum.

[3] Subject to revision.

The sum of the following State totals does not reach the total for the United States given in the preceding table partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the second table following.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron ore values in State totals and pig iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper, lead, and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to year, and it is believed that the reader can determine readily just what minerals are covered by the total concerned.

In every table each mineral produced is listed, and all figures are shown except those that the Bureau of Mines is not at liberty to publish.

Value of mineral products of the United States, 1939–43, and total, 1911–43, by States [1]

State	1939	1940	1941	1942	1943	1911–43 [1]

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. Comparable totals for years before 1911 not available.

The sum of the following State totals does not reach the total for the United States given in the preceding table partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the second table following.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron ore values in State totals and pig iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper, lead, and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to year, and it is believed that the reader can determine readily just what minerals are covered by the total concerned.

In every table each mineral produced is listed, and all figures are shown except those that the Bureau of Mines is not at liberty to publish.

Value of mineral products of the United States, 1939–43, and total, 1911–43, by States [1]

Mineral products of the United States and principal producing States in 1942

Rank in value	Product	Principal producing States[1]	
		In order of quantity	In order of value
12	Aluminum	Tennessee, Washington, New York, North Carolina	Rank same as for quantity.
94	Andalusite	California	Do.
(2)	Antimonial lead	Not separable by States	Not separable by States.
68	Antimony ore	Idaho, Nevada, Montana, California	Rank same as for quantity.
82	Aplite (crude)	Virginia	Do.
60	Arsenious oxide	Montana, Utah, Nevada	Do.
67	Asbestos	Vermont, Arizona, North Carolina, Georgia	Vermont, Arizona, North Carolina, California.
	Asphalt:		
44	Native	Texas, Oklahoma, Kentucky, Alabama	Oklahoma, Utah, Texas, Kentucky.
17	Oil	Not separable by States	Not separable by States.
51	Barite (crude)	Missouri, Georgia, Tennessee, Arkansas	Missouri, Tennessee, Georgia, Arkansas.
31	Bauxite	Arkansas, Alabama, Georgia, Virginia	Rank same as for quantity.
93	Beryllium ore	South Dakota, Maine, New Hampshire, Colorado	Do.
50	Bismuth	Not separable by States	Not separable by States.
96	Bitumen (natural sulfonated)	Utah	Rank same as for quantity.
41	Boron minerals	California	Do.
29	Bromine	Texas, North Carolina, Michigan, California	Texas, Michigan, North Carolina, California.
40	Cadmium	Not separable by States	Not separable by States.
56	Calcium-magnesium chloride	Michigan, West Virginia, California, Ohio	Rank same as for quantity.
6	Cement	Pennsylvania, California, Texas, New York	Do.
49	Chromite	Montana, California, Oregon, Washington	California, Montana, Oregon, Washington.
	Clay:		
16	Products (other than pottery and refractories).		Ohio, Pennsylvania, California, Illinois.
24	Raw (sold by producers)	Pennsylvania, Missouri, Ohio, Georgia	Georgia, Pennsylvania, Missouri, Kentucky.
1	Coal:		
	Bituminous	West Virginia, Pennsylvania, Illinois, Kentucky	West Virginia, Pennsylvania, Kentucky, Illinois.
	Pennsylvania anthracite	Pennsylvania	Rank same as for quantity.
72	Cobalt	Pennsylvania, Nevada	Do.
5	Coke	Pennsylvania, Ohio, Indiana, Alabama	Pennsylvania, Ohio, Indiana, New York.
9	Copper	Arizona, Utah, Montana, Nevada	Rank same as for quantity.
48	Diatomite	California, Oregon, Nevada, Washington	Do.
101	Dumortierite	Nevada	Do.
90	Emery	New York	Do.
58	Feldspar (crude)	North Carolina, South Dakota, New Hampshire, Colorado	North Carolina, New Hampshire, South Dakota, Virginia.
8	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Tennessee.
89	Flint lining for tube mills	Minnesota, North Carolina, Wisconsin	Rank same as for quantity.
34	Fluorspar	Illinois, Kentucky, Colorado, New Mexico	Do.
54	Fuller's earth	Texas, Georgia, Florida, Illinois	Do.
76	Garnet (abrasive)	New York, North Carolina, Idaho	Do.
(3)	Gems and precious stones	No canvass for 1942	No canvass for 1942.
102	Germanium	Not separable by States	Not separable by States.
13	Gold	California, South Dakota, Alaska, Utah	Rank same as for quantity.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1942—Continued

Rank in value	Product	Principal producing States[1]	
		In order of quantity	In order of value
71	Graphite:		
	Amorphous	Rhode Island	Rank same as for quantity.
	Crystalline	New York, Texas, Alabama	Do.
65	Grindstones and pulpstones	Ohio, West Virginia, Washington	Do.
37	Gypsum (crude)	New York, Michigan, Iowa, California	Do.
84	Helium	Texas	Do.
81	Indium	Not separable by States	Not separable by States.
63	Iodine (natural)	California	Rank same as for quantity.
	Iron:		
7	Ore	Minnesota, Michigan, Alabama, Wisconsin	Minnesota, Michigan, Alabama, New York.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Rank same as for quantity.
83	Kyanite	Virginia, California, Georgia, North Carolina	Virginia, North Carolina, Georgia, California.
18	Lead	Missouri, Idaho, Utah, Oklahoma	Rank same as for quantity.
21	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
79	Lithium minerals	South Dakota, California, Maine, North Carolina	Do.
45	Magnesite (crude)	Washington, Nevada, California, Texas	Washington, California, Nevada, Texas.
27	Magnesium	Texas, Michigan, Ohio, California	Rank same as for quantity.
32	Magnesium compounds (natural)	Texas, Michigan, Nevada, California	Texas, Michigan, California, Nevada.
38	Manganese ore	Montana, California, Virginia, Washington	Montana, Washington, California, Virginia.
42	Manganiferous ore	Minnesota, New Mexico, Michigan, Montana	Minnesota, New Mexico, Montana, Michigan.
62	Manganiferous zinc residuum	New Jersey	Rank same as for quantity.
	Marl:		
85	Calcareous	Minnesota, Michigan, Virginia, Indiana	Michigan, Virginia, Minnesota, West Virginia.
69	Greensand	New Jersey	Rank same as for quantity.
33	Mercury	California, Oregon, Nevada, Idaho	Do.
59	Mica	North Carolina, California, Colorado, Georgia	North Carolina, South Dakota, Georgia, New Hampshire.
	Scrap	do	North Carolina, South Dakota, Colorado, California.
	Sheet	North Carolina, South Dakota, New Hampshire, Connecticut	North Carolina, South Dakota, New Hampshire, Georgia.
97	Millstones		North Carolina, Virginia, New York.
	Mineral pigments:		
36	Natural pigments and manufactured iron oxide pigments.	Pennsylvania, Illinois, Virginia, New Jersey	Pennsylvania, New Jersey, Illinois, California.
26	Lead and zinc pigments	Pennsylvania, Illinois, Kansas, Ohio	Rank same as for quantity.
(3)	Mineral waters	No canvass for 1942	No canvass for 1942.
20	Molybdenum	Colorado, Utah, New Mexico, Arizona	Rank same as for quantity.
4	Natural gas	Texas, Louisiana, California, Oklahoma	Texas, California, West Virginia, Louisiana.
14	Natural gasoline and allied products:		
	Natural gasoline and cycle products	Texas, California, Oklahoma, Louisiana	Rank same as for quantity.
	Liquefied petroleum gases	Texas, Oklahoma, California, Illinois	Do.
73	Nickel	Not separable by States	Not separable by States.
80	Oilstones, etc	Arkansas, Ohio, New Hampshire, Indiana	Rank same as for quantity.
92	Olivine	North Carolina	Do.

(4)	Ores (crude), etc.:		
	Copper	Utah, Arizona, Nevada, New Mexico	Value not available.
	Dry and siliceous (gold and silver)	Alaska, California, South Dakota, Nevada	Do.
	Lead	Missouri, Idaho, Utah, Nevada	Do.
	Lead-copper	New Mexico, Arizona, Idaho, Utah	Do.
	Zinc	Oklahoma, Kansas, Tennessee, Missouri	Do.
	Zinc-copper	Arizona	Do.
	Zinc-lead	Oklahoma, Kansas, Idaho, Missouri	Do.
	Zinc-lead-copper	Utah	Do.
66	Peat	Illinois, New York, Michigan, New Jersey	Maine, Illinois, Michigan, Iowa.
78	Pebbles for grinding	Texas, North Carolina, Minnesota, Wisconsin	Rank same as for quantity.
2	Petroleum	Texas, California, Oklahoma, Louisiana	Texas, California, Oklahoma, Illinois.
28	Phosphate rock	Florida, Tennessee, Montana, Idaho	Rank same as for quantity.
57	Platinum metals	Alaska, California, Oregon	Do.
25	Potassium salts	New Mexico, California, Utah, Maryland	Do.
64	Pumice	California, Kansas, New Mexico, Nebraska	New Mexico, California, Kansas, Nebraska.
53	Pyrites	Tennessee, California, Virginia, New York	Rank same as for quantity.
87	Radium	Not separable by States	Not separable by States.
23	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Ohio, Kansas.
11	Sand and gravel	California, Texas, Illinois, New York	California, New York, Texas, Illinois.
61	Selenium	Not separable by States	Not separable by States.
74	Silica (quartz)	California, Wisconsin, North Carolina, Tennessee	North Carolina, California, Tennessee, Maryland.
47	Silica sand and sandstone (ground)	Illinois, New Jersey, Ohio, Pennsylvania	Rank same as for quantity.
22	Silver	Idaho, Montana, Utah, Arizona	Do.
39	Slate		Pennsylvania, Vermont, New York, Maine.
46	Sodium salts (carbonates and sulfates) (natural).	California, Texas, Wyoming, Washington	Rank same as for quantity.
10	Stone	Pennsylvania, Michigan, Ohio, Illinois	Pennsylvania, Ohio, Illinois, New York.
88	Strontium minerals	California, Texas, Washington	Rank same as for quantity.
19	Sulfur	Texas, Louisiana, California, Utah	Do.
35	Sulfuric acid from copper, lead, and zinc smelters and zinc roasters.	Pennsylvania, Illinois, Arizona, Tennessee	Do.
95	Sulfur ore	Texas, Colorado	Do.
43	Talc, pyrophyllite, and ground soapstone [5]	New York, Vermont, North Carolina, California	New York, California, Vermont, North Carolina.
103	Tantalum and columbium ores	South Dakota	Rank same as for quantity.
86	Tellurium	Not separable by States	Not separable by States.
91	Thallium	do	Do.
99	Tin	Alaska, South Dakota, New Mexico, California, and Nevada	Alaska, South Dakota, New Mexico, and California and Nevada.
	Titanium concentrates:		
55	Ilmenite	Virginia, New York, North Carolina, Florida	New York, Virginia, North Carolina, Florida.
70	Rutile	Virginia, Florida, Arkansas	Rank same as for quantity.
98	Topaz (industrial)	South Carolina	Do.
77	Tripoli	Illinois, Missouri, Arkansas, Pennsylvania	Do.
30	Tungsten ore	California, Nevada, Idaho, Colorado	Do.
52	Vanadium	Colorado, Utah, Idaho, Arizona	Do.
75	Vermiculite	Montana, Colorado, North Carolina, Wyoming	Do.
15	Zinc	Oklahoma, New Jersey, Idaho, Kansas	Do.
100	Zircon	Florida	Do.

---

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output. Compilation of rank for 1943 not yet available.

[2] Separate figures for antimonial lead from primary sources not available.

[3] No canvass for 1942.

[4] Value not available.

[5] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1942 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	17	1.62	Coal, iron ore, cement, stone.
Alaska	35	.32	Gold, coal, platinum metals, sand and gravel.
Arizona	14	1.90	Copper, gold, silver, zinc.
Arkansas	25	.97	Petroleum, bauxite, coal, sand and gravel.
California	3	8.73	Petroleum, natural gas, cement, gold.
Colorado	19	1.54	Molybdenum, coal, gold, zinc.
Connecticut	44	.08	Stone, sand and gravel, clay products, magnesium.
Delaware	50	.01	Clay products, sand and gravel, stone, raw clay.
District of Columbia	49	.01	Clay products.
Florida	34	.33	Phosphate rock, stone, cement, sand and gravel.
Georgia	33	.35	Stone, raw clay, cement, clay products.
Idaho	26	.88	Zinc, lead, silver, gold.
Illinois	5	5.28	Petroleum, coal, stone, sand and gravel.
Indiana	20	1.44	Coal, cement, petroleum, stone.
Iowa	31	.46	Cement, coal, stone, clay products.
Kansas	9	3.25	Petroleum, natural gas, cement, zinc.
Kentucky	8	3.29	Coal, natural gas, petroleum, stone.
Louisiana	7	3.97	Petroleum, natural gas, natural gasoline, sulfur.
Maine	46	.06	Cement, sand and gravel, stone, slate.
Maryland	36	.30	Sand and gravel, coal, cement, stone.
Massachusetts	40	.14	Stone, sand and gravel, clay products, lime.
Michigan	12	2.60	Iron ore, petroleum, cement, salt.
Minnesota	10	3.09	Iron ore, manganiferous ore, sand and gravel, cement.
Mississippi	30	.48	Petroleum, sand and gravel, clay products, natural gas.
Missouri	22	1.23	Lead, cement, coal, stone.
Montana	18	1.56	Copper, zinc, petroleum, natural gas.
Nebraska	41	.14	Sand and gravel, cement, petroleum, stone.
Nevada	27	.74	Copper, gold, tungsten ore, silver.
New Hampshire	47	.02	Stone, clay products, feldspar, sand and gravel.
New Jersey	28	.63	Zinc, sand and gravel, clay products, stone.
New Mexico	15	1.72	Petroleum, potassium salts, copper, natural gas.
New York	16	1.67	Cement, petroleum, sand and gravel, stone.
North Carolina	38	.28	Bromine, clay products, stone, sand and gravel.
North Dakota	45	.06	Coal, sand and gravel, clay products, natural gas.
Ohio	11	2.83	Coal, natural gas, clay products, stone.
Oklahoma	6	4.37	Petroleum, natural gas, zinc, natural gasoline.
Oregon	39	.23	Sand and gravel, cement, stone, gold.
Pennsylvania	2	13.57	Coal, petroleum, cement, natural gas.
Rhode Island	48	.01	Sand and gravel, stone, graphite, clay products.
South Carolina	43	.09	Stone, clay products, raw clay, sand and gravel.
South Dakota	32	.39	Gold, stone, sand and gravel, cement.
Tennessee	23	1.08	Coal, cement, stone, zinc.
Texas	1	14.65	Petroleum, natural gas, natural gasoline, sulfur.
Utah	13	2.37	Copper, coal, gold, lead.
Vermont	42	.12	Stone, slate, talc, lime.
Virginia	21	1.29	Coal, stone, sand and gravel, cement.
Washington	29	.57	Cement, coal, sand and gravel, magnesite.
West Virginia	4	7.96	Coal, natural gas, petroleum, natural gasoline.
Wisconsin	37	.29	Stone, iron ore, sand and gravel, zinc.
Wyoming	24	1.03	Petroleum, coal, natural gas, iron ore.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. Compilation of rank for 1943 not yet available.

Prices of gold, silver, copper, lead, and zinc, 1932–43 [1]

Year	Gold [2]	Silver [3]	Copper [4]	Lead [4]	Zinc [4]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1932	[5] $20.67+	$0.282	$0.063	$0.030	$0.030
1933	25.56	.350	.064	.037	.042

1943	35.00	[8] .711+	.130	.075	.108

[1] Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ per fine ounce. For table of prices for silver, copper, lead, and zinc from 1850 to 1931, by years, see Mineral Resources, 1931, pt. 1, p. A115.

[2] 1932: Legal coinage value; 1933–34: Yearly average weighted Government price; 1935–43: Price under authority of Gold Reserve Act of January 31, 1934.

[3] 1932–33: Average New York price for bar silver; 1934 and 1938–43: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[4] Yearly average weighted price of all grades of primary metal sold by producers. In 1942 and 1943, price includes premiums paid to miners by the Government.

[5] $20.671835. [6] $0.64646464. [7] $0.67878787. [8] $0.71111111.

---

[1] Value not included in total value for State.

[2] Value included under "Miscellaneous."

[3] Exclusive of puzzolan, value for which is included under "Miscellaneous."

[4] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[5] No canvass.

[6] Not valued as ore; value of recoverable metal content included under the metals.

[7] Includes minerals indicated by "2" and "3" above.

Magnesium compounds (natural)	pounds	12,810,000	656,297	78,968,525	2,100,588	155,916,000	4,451,499
Manganese ore	short tons	4,096	77,873	(1)	(1)	(1)	(1)
Manganiferous ore	do	464	(1)	(1)	(1)	(1)	(1)
Mercury	flasks (76 pounds)	25,714	4,757,604	29,906	5,872,043	33,812	6,600,440
Mica, scrap	short tons	460	2,300	(1)	(1)	(1)	(1)
Mineral paints (zinc and lead pigments)	do	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Mineral waters	gallons sold	(5)	(5)	(5)	(5)	(5)	(5)
Molybdenum	pounds	(1)	(1)	(1)	(1)	(1)	(1)
Natural gas	M cubic feet	374,905,000	96,673,000	403,968,000	110,004,000	450,000,000	119,250,000
Natural gasoline and allied products:							
Natural gasoline	gallons	577,127,000	24,067,000	545,881,000	22,365,000	583,181,000	23,910,000
Liquefied petroleum gases	do	82,638,000	2,082,000	87,445,000	2,564,000	110,139,000	3,524,000

See footnotes at end of table, page 50.

Mineral products of the United States, 1941–43, by States—Continued

CALIFORNIA—Continued

Product		1941		1942		1943	
		Quantity	Value	Quantity	Value	Quantity	Value
Ores (crude), etc.:							
Copper	short tons	292,232	(6)	393,944	(6)	265,526	(6)
Dry and siliceous (gold and silver)	do	3,968,283	(6)	2,076,551	(6)	412,793	(6)
Lead	do	18,338	(6)	29,857	(6)	49,038	(6)
Lead-copper	do	2	(6)	5	(6)		
Zinc	do	1,330	(6)	2,089	(6)	8,428	(6)
Zinc-copper	do					3,435	(6)
Zinc-lead	do			752	(6)	736	(6)
Peat	do	3,618	$17,898	3,031	$17,262	3,677	$21,365
Pebbles for grinding	do	574	2,856	(1)	(1)	(1)	(1)
Petroleum	barrels	230,263,000	239,500,000	248,326,000	255,800,000	284,235,000	301,300,000
Platinum metals (crude)	troy ounces	1,300	(1)	(1)	(1)	(1)	(1)
Potassium salts	short tons	(1)	(1)	(1)	(1)	(1)	(1)
Pumice	do	77,951	268,734	74,925	206,424	25,490	160,441
Pyrites	long tons	(1)	(1)	(1)	(1)	(1)	(1)
Quartz crystal	pounds					(1)	(1)
Salt (sodium chloride)	short tons	484,632	2,290,265	546,320	2,494,485	596,015	2,839,560
Sand and gravel	do	[7] 19,617,609	[7] 10,988,766	34,791,974	22,067,004	29,025,759	18,548,747
Sand and sandstone (ground)	do	(1)	(1)	(1)	(1)	(1)	(1)
Silica (quartz)	do	2,526	36,721	(1)	(1)	(1)	(1)
Silver	troy ounces	2,154,188	1,531,867	1,450,440	1,031,424	609,075	433,120
Slate			53,765		(1)		(1)
Sodium salts (carbonates and sulfates) (natural)	short tons	218,903	2,224,084	241,386	2,712,438	257,426	3,146,738
Stone	do	[8] 9,139,390	[8] 7,535,017	[8] 12,288,700	[8] 11,031,326	8,231,250	6,595,799
Strontium minerals	do	(1)	(1)	(1)	(1)	(1)	(1)
Sulfur	long tons	8,803	139,800	(1)	(1)		
Sulfuric acid [9]	short tons	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Talc and ground soapstone	do	59,203	811,793	51,649	678,906	58,003	912,291
Tin (metallic equivalent)	do			(1)	(1)	(1)	(1)
Tripoli	do	(1)	(1)				
Tungsten ore (60-percent concentrates)	do	2,603	3,665,194	(1)	(1)	(1)	(1)
Vermiculite	do			(1)	(1)		
Zinc	do	440	66,000	613	114,018	1,856	400,896
Zircon	do	30	545				
Miscellaneous [10]			12,185,888		19,630,115		52,064,500
Total value, eliminating duplications			506,795,395		541,391,606		569,386,000

---

[1] Value included under "Miscellaneous."

[2] Value not included in total value for State.

[3] Figures not available.

[4] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[5] No canvass.

[6] Not valued as ore; value of recoverable metal content included under the metals.

[7] "Commercial." Value of "Government-and-contractor" included under "Miscellaneous."

[8] Exclusive of dimension unclassified stone in 1941 and of dimension marble in 1942, value for which is included under "Miscellaneous."

[9] From lead smelting.

[10] Includes minerals indicated by "1," "7," and "8" above.

Miscellaneous [6]		----------	2,676,168	----------	4,734,531	----------	8,516,687
Total value, eliminating duplications		----------	142,433,673	----------	161,433,922	----------	156,875,000

---

[1] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[2] Value included under "Miscellaneous."

[3] Value not included in total value for State.

[4] No canvass.

[5] Not valued as ore; value of recoverable metal content included under the metals.

[6] Includes minerals indicated by "2" above.

Product		1941		1942		1943	
		Quantity	Value	Quantity	Value	Quantity	Value
Mineral waters	gallons sold	(4)	(4)	(4)	(4)	(4)	(4)
Ore (dry and siliceous) (gold and silver)	short tons	135,288	(5)	86,270	(5)	156	(5)
Sand and gravel	do	1,125,725	$611,469	729,543	$355,170	452,166	$217,280
Silver	troy ounces	6,525	4,640	5,064	3,601	135	96
Stone	short tons	2,055,090	2,574,797	2,040,610	2,624,284	[6] 1,615,730	[6] 1,804,196
Topaz, industrial	do	(1)	(1)	(1)	(1)	(1)	(1)
Vermiculite	do			(1)	(1)	(1)	(1)
Miscellaneous [7]			47,762		4,363,821		4,643,022
Total value, eliminating duplications			7,245,613		5,890,982		4,759,000

[1] Value included under "Miscellaneous."

[2] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[3] Value not included in total value for State.

[4] No canvass.

[5] Not valued as ore; value of recoverable metal content included under the metals.

[6] Exclusive of dimension granite, value for which is included under "Miscellaneous."

[7] Includes minerals indicated by "1" and "4" above.

SOUTH DAKOTA

---

[1] Value included under "Miscellaneous."

[2] Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products.

[3] No canvass.

[4] Figures cover fiscal year ended June 30 of year stated.

[5] Not valued as ore; value of recoverable metal content included under the metals.

[6] From zinc smelting.

[7] Value not included in total value for State.

[8] Includes minerals indicated by "1" above.

GENERAL SUMMARY

The sharp decline in gold output so evident in 1942 continued at an accelerated rate in 1943, and production in the United States fell to the lowest figure since gold was discovered in California in 1848. Under permits from the War Production Board a few large companies operated on a restricted basis until June, after which gold mining as such almost ceased. As a result, about 55 percent of the 1943 output was produced before July and only 45 percent thereafter.

The decline in gold mining was general all over the world, and output was estimated to be 15 percent below that of 1942. Output in North America was reduced 37 percent, distributed as follows: United States 61 percent, Canada 25 percent, and Mexico 21 percent; Newfoundland reported an increase of 19 percent. South American output is estimated to have decreased about 17 percent. South African production held up well and dropped only 9 percent from 1942.

As in 1942, silver output in the United States was sustained at a substantial figure because of high base-metal production; the decline from 1942 was 24 percent. Output in Canada was 17 percent below that for 1942. Mexican production increased nearly 2 percent.

REGULATIONS

Gold.—Regulations and legislative proposals on gold were few in 1943. Holding that many gold miners were without funds to continue their payments under contract and to meet past and present tax obligations, Senator James E. Murray of Montana in May introduced a bill (S. 344) containing provisions that would permit owners and operators of gold mines closed by Limitation Order L–208 to petition the courts for relief and would direct the Reconstruction Finance Corporation to make loans to maintain the properties and equipment.

Silver.—New regulations on silver were few and for the most part not of outstanding significance in 1943. The price and allocation of the metal continued under Government control, with features not greatly changed from 1942. Early in the year bills were introduced by Senators Theodore Green (Rhode Island), Abe Murdock (Utah), and Pat McCarran (Nevada) providing for the disposal of silver from Treasury stocks.

The Green bill in final form was signed by the President on July 12, 1943. Briefly, this legislation made possible the release of silver from Treasury stocks for domestic consumption for use in, but not limited to, the making of munitions of war and the supplying of civilian needs, as well as the conversion of existing plants to these purposes. It may be sold at not less than 71.11 cents per ounce, and it may be leased under such terms as the Secretary of the Treasury may deem advisable.

On March 23 the Office of Price Administration permitted an increase of 36 cents per ounce of silver contained in about a dozen specified lines of finished silverware because the silversmiths must use domestic silver priced at 71.11 cents rather than imported silver at lower cost.

War Production Board Order M–199 (the basic silver conservation order issued in July 1942) was amended three times in 1943—first, on February 25, whereby, except for filling orders having a preference rating of A–1–a or higher, manufacturers were to receive but half of their 1941 or 1942 consumption of domestic silver, whichever amount was higher; second, on May 10, under which the quotas were changed from a monthly to a quarterly basis and certain further restrictions were made in the use of silver for nonessential purposes; and third, on July 29 following the passage of the Green bill, whereby Treasury silver was added to the list and limited to the manufacture of engine bearings, official military insignia, brazing alloys, and solders, whereas foreign silver was restricted to medical use, the photographic industry, and certain uses carrying ratings of AA–5 or higher.

MONETARY CONSIDERATIONS

Among the numerous post-war problems that received serious attention in 1943, one of vital importance was the question of a stable currency to facilitate the restoration and expansion of international trade. Naturally, much of the discussion centered around gold.

Many held that the gold standard of the period before World War I had little or no chance of being restored. On the other hand, sentiment was freely expressed in many circles that gold under some plan would be the logical standard of value and medium of exchange for international purposes. The position was taken that gold is the one medium of exchange that inhabitants of all nations will accept and that it is effective when other forms of money fail; that many countries have their economies so closely linked with gold mining that demonetization of the metal would result in very serious economic disturbances, or even ruin; and that if the Allied Nations are to function as well in peace as they have in war, they must all be anchored to a common stable currency.

Plans for establishing an international monetary standard were proposed by United States, British, Canadian, and French experts. The American plan favored an actual gold fund of $5,000,000,000 to which all nations would be eligible to contribute. Contributions might be in gold, securities, or national currencies, and gold would comprise 30 to 50 percent of each nation's quota, based upon some accepted formula. The monetary unit would be the "unita," equal to 137⅐ grains of gold and having a value of $10 based on gold at $35 per fine ounce. The value of the "unita" could not be changed without the consent of 85 percent of the member countries.

Some objection was voiced to the American plan in that it was not clear what would happen if a contraction of world trade should set in after the war and certain nations should continue to have unfavorable trade balances year after year; or if a nation wanted to separate itself from world deflation to pursue independent policies of public works, expansion, and similar means of curing unemployment; or if a nation wanted to put into effect certain social reforms that might increase the cost of production of commodities. It was claimed that such factors would tend to unbalance trade or cause a fall in exchange, or both, and exchange rates could not be changed except by a majority or greater vote of the nations on the international monetary authority. Consequently, it was pointed out, the United States might be unable to fight a depression at home or might be obliged to accept a lower standard of living for its citizens than it would like to provide. The Canadian plan would give each country in the agreement the power unilaterally to depreciate its exchange once, up to 10 percent.

According to Condliffe,[1] there are three good reasons why gold should be used again in a restored international monetary standard: (1) Otherwise, the United States will have no use for its great accumulated stock; (2) British countries produce about three-fourths of current production, and the sale of their gold is an important item in settling the passive balance of the sterling area; (3) the U. S. S. R. is now one of the great gold-producing countries, and gold shipments are an important means of securing much-needed imports for the development of the country.

An unfavorable stand toward gold was taken by Hardy,[2] who states that "probably * * * gold will still be bought and sold to readjust the balance of payments, but the system could be run just as well without it."

A report from Russia indicates that the Soviet Government favors the use of gold after the war in international transactions and in the rehabilitation of its country. Unusual interest in gold was shown in other foreign countries. In India gold sold at $77.25 per ounce before the Government launched anti-inflationary measures and sold the metal officially to hoarders, which brought the price down eventually to $63 per ounce; in Egypt the Government was getting the equivalent of about $66 per ounce; in Argentina gold sold for $37 to $44 per ounce; and in Mexico, $38 to $39 per ounce. Early in 1944 the Chilean Government took steps to auction the gold contained in gold and copper ores, concentrates, and bars sent from Chile to the United States. These steps were taken to counter the rising inflation of Chile's paper currency and to halt the increasing flow of gold from Chile to the black markets of Argentina and Brazil.

In addition to much discussion on managed paper currency and gold in some form as an international monetary base, chaotic world conditions again brought up the age-old question of bimetallism and its place in post-war economic reconstruction. This standard, frequently condemned as unsound and unworkable, was championed, among others, by Brownell,[3] who took the position that the best interests of the United States and of the world at large demand that international bimetallism be adopted; and that past difficulties with the standard could be readily overcome if a universal fixed ratio were established between the two metals and if a fixed price were set for both the metals.

[3] Brownell, F. H., The United States Should Advocate International Bimetallism After the War: Extension of Remarks of Hon. Compton I. White, Congressional Record—appendix, April 16, 1943, pp. A 2005–A 2008.

Concerning the workability of bimetallism, White[4] wrote that a verdict of success or failure cannot be passed on bimetallism until it has been tried by all the leading nations at the same time with the same mint ratio in each country; and that the great obstacle to international bimetallism lies in the preference of mankind for gold money over silver money, with the result that in many transactions a premium for gold would be offered equal to the cost of handling and storing the two masses, and that the earliest sign of a premium on gold, after a bimetallic agreement had been made, would tend to render the agreement inoperative.

POST-WAR OUTLOOK

Gold will come out of World War II facing a rather unfavorable outlook. The industry should recover fairly rapidly following the removal of Government restrictions; but production is unlikely to return to the 1937–41 level for a number of years, unless the price of gold is increased. These conclusions are drawn from the following facts and inferences.

The production of gold bears a close, but not absolute, relation to the purchasing power of the gold ounce (the price of gold per fine ounce divided by the wholesale price index), so that gold output declines as the purchasing power of the gold ounce decreases and rises as the purchasing power increases. The truth of this is easily demonstrated. For example, in 1920 the purchasing power had slumped to 13, and gold output for the year was 2,383,000 ounces; in 1940 it had risen to 45, and production climbed to 4,870,000 ounces. It is generally believed that price controls will be maintained for some time after the war, and even if they were removed demand for consumer goods probably would hold prices at a high level for several years. Consequently, the gold industry is likely to be confronted with a much lower purchasing power than in the years of high production from 1937 to 1941. After post-war spending has subsided considerably, a period of falling prices may come, with a corresponding increase in the purchasing power of the gold ounce, and this will result in expanded gold mining. It is not improbable that this will happen.

Other probable factors that may retard recovery of the industry after the war are continued high labor costs and high taxes, the time and expense required to recondition many of the mines, and the time and expense of resuming development of ore.

On the whole, placer mining will recover its position more quickly than lode mining, as less time and expense will be required to recondition the workings and to develop ore. Also, wages in placer operations form a smaller part of the operating costs than in lode mining.

The future of gold as a monetary base cannot be predicted. Recent years have witnessed a drifting away from the various gold standards and the adoption by many economists of the theories of managed currencies. However, it is rather generally believed that gold in some form will be preserved as the principal monetary metal, so that gold mining should remain an important industry for years. If more gold is needed to support the monetary system adopted, it can be produced by raising the price of gold so that the purchasing power of the gold ounce will be increased.

---

[4] White, Horace, Money and Banking: 6th ed., revised by Charles Tippets and Lewis A. Froman, Ginn & Co., 1935, pp. 90, 126.

Production of silver in the post-war period will be determined to a great extent by two factors: (1) Government policies to determine to what extent and at what price silver is used in the monetary system; (2) the price of copper, lead, and zinc.

Arguments are being advanced to show the advantages of international bimetallism and the greater use of silver in monetary systems in general. Only time will tell the outcome of these actions and their effects in increasing the price of silver to the benefit of the miner. In this respect, then, the silver industry is tightly interlocked with domestic and world political, economic, and monetary theories.

Silver will continue to be derived in considerable part as a byproduct in the mining of copper, lead, and zinc, and the output of the metal thus will be materially influenced by the prices of these base metals. It is generally believed that base-metal mining will continue at a reasonably high level after the war, hence silver from that source will appear in substantial quantities. Silver derived from dry and siliceous ores responds quickly to price changes, so that a sharp rise in price would result in a marked increase of metal from these ores. However, the tenor of silver ores in general has been declining for some years, so that in the future price increases must be greater than in the past if correspondingly greater quantities of silver are required.

The industrial use of silver has climbed phenomenally during the war, and some of these gains will be held in the post-war era. Also, it is certain that silver for subsidiary coinage will be required in greater quantities in rehabilitated countries. On the whole, the post-war outlook for silver is reasonably good, and for some years it is expected that domestic production will approximate that of the late 1920's.

DOMESTIC REFINERY PRODUCTION

The figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines and were agreed upon after conference and adjustment between the two Bureaus.

The State totals are based upon bullion deposits in the United States mints and assay offices and upon returns to the Bureau of the Mint from smelting and refining companies. The state distribution is adjusted further by the Bureau of Mines from its geographical records of sources and production, both historical and current, from the producing mines and is tabulated for the mine reports discussed later. The data for the total production and in part for the distribution are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices; (2) the domestic gold and silver in fine bars reported by private refineries, supplemented by data of content of unrefined mattes, blister copper, copper anodes, and lead bullion; and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

Gold and silver produced in the United States, 1939–43, and approximate distribution of source, by States and Territories, in 1943

[Refinery figures supplied by U. S. Bureau of the Mint]

	272, 561, 505	6, 260, 183, 770	3, 826, 220, 888	2, 942, 393, 088

[1] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto at $20.67+ per fine ounce. Dollar figures are rounded.

[2] Silver valued in 1934 and thereafter at Government's average buying price for domestic product: In 1934 and 1938 at $0.64+ per fine ounce, in 1935 at $0.71875, in 1936 at $0.7745, in 1937 at $0.7735, in 1939 at $0.678787+, and in 1940–43 at $0.7111+.

PRICES OF GOLD AND SILVER

Since January 1934 the price of gold at the United States Mint has been $35 per fine troy ounce; the price of domestic silver mined after July 1, 1939, was fixed at $0.711+ per ounce on July 6, 1939. A complete account of regulations pertaining to gold and silver in 1933–34 is given in the chapter on Gold and Silver in Minerals Yearbook, 1934 (pp. 25–46).

According to the Director of the Mint, the following prices for silver prevailed in London and New York throughout 1943: London price per ounce, 0.925 fine, 23.5 d.; exchange, New York on London, $4.0350; United States equivalent, per fine ounce, of London price at current rate of exchange, $0.42713; New York price of fine bar silver, $0.45062.

UNITED STATES AND WORLD MONETARY STOCKS

The gold reserves of the United States continued to fall in 1943, according to the Federal Reserve Bulletin, and totaled $21,938,000,000 at the end of the year. This represents a decrease of $788,000,000 (over 3 percent) from the total of $22,726,000,000 at the close of 1942. The present holdings constitute about 67 percent of the total reserves of the world, believed to be about $33,000,000,000, including stabilization funds.

United States Treasury silver holdings at the close of 1943 approximated 3,254,000,000 ounces, a loss of about 80,000,000 ounces from 1942.

The Twenty-eighth Annual Review of the Silver Market, 1943, by Handy & Harman, contains the following comments on Treasury purchases, sales, and coinage of silver:

> For the first year since the inauguration of the silver purchase program in 1934, United States Government holdings of the white metal showed a decrease. No foreign silver at all was bought during 1943 and acquisitions of newly-mined domestic silver amounted to only 5,400,000 ounces. In addition, a scant 400,000 ounces were received in miscellaneous deposits at the mints and assay offices. On the other hand, substantial quantities of bullion were released from Treasury stocks for various purposes. Nearly 4,000,000 ounces of "silver ordinary" were sold to industry, this amount being the balance remaining from the Treasury Department's original offer made in September 1942. During the first eleven months of the year 21,500,000 ounces were consumed in the coinage of new nickels. The silver used in these coins constituted a loss to Treasury stocks because nickels are classed as "minor coinage" and their silver content is not included in such stocks. Official figures for the same eleven months disclose the fact that 17,218,000 ounces were sold to industry under the Green Act and that 40,897,000 ounces were lend-leased. We understand that the latter amount was the result of direct transactions between the United States and other governments, and that the silver was shipped abroad mostly as bullion, although 5,823,000 ounces were in the form of coinage. While no confirmation is available, it seems likely that Great Britain and India were the principal beneficiaries of this lend-leased silver.
>
> The foregoing figures show a net decrease in Treasury silver holdings of 77,800,000 ounces, but inasmuch as sales under the Green Act continued during December and lend-lease transfers may well have continued, the net decrease for the year 1943 should exceed 80,000,000 ounces. In spite of this decrease, progress was made towards the goal set by the Silver Purchase Act that "one-fourth of the total monetary value of the gold and silver stocks shall be in silver". This fact, paradoxical as it may seem, was accomplished because of the decrease in Treasury gold holdings.
>
> According to the Treasury's Daily Statement dated December 31st, 1943, there were 1,175,000,000 ounces of Government-owned silver bullion which remained unpledged as backing for silver certificates. However, a footnote indicates that of this silver the Defense Plant Corporation, etc. held 829,000,000 ounces, an amount which was 242,000,000 ounces larger than that held at the end of 1942.
>
> In 1943 the United States used more silver for domestic coinage than in any prior year. Official figures for the first eleven months show that 95,818,000 ounces were so consumed, this amount being 17,000,000 ounces more than the former full year's record established in 1942. As previously mentioned, 21,500,000 ounces went into the new "silver" nickels, which left a balance of 74,300,000 ounces for subsidiary coinage consisting of half-dollars, quarters, and dimes. Up to June 30th 6,000,000 ounces of silver for subsidiary coinage

were obtained from the melting of "worn and uncurrent" standard silver dollars, and it is probable that many more millions of ounces were derived from the same source during the next five months, because in that period the number of standard silver dollars decreased by 34,717,000 coins, which would produce almost 27,000,000 ounces.

CONSUMPTION AND USES

Gold.—Gold continued to play an important part in the war for use in many types of instruments, electrical and industrial equipment, and color photography. No figures are available on the quantity of gold used in the various products.

Silver.—The gross industrial consumption of silver rose from an estimated 121,000,000 ounces in 1942 to 159,000,000 ounces in 1943, distributed by uses as follows: [5]

	1942	*1943*
Bearings	10, 000, 000	25, 000, 000
Photographic	20, 000, 000	20, 000, 000
Brazing alloys	(1)	20, 000, 000
Contacts	10, 000, 000	10, 000, 000
Dental and surgical	2, 000, 000	5, 000, 000
Insignia	5, 000, 000	5, 000, 000
Solder	1, 000, 000	4, 000, 000
Chemical products, n. e. s	3, 000, 000	3, 000, 000
Silverware	30, 000, 000	30, 000, 000
Jewelry	10, 000, 000	5, 000, 000
Unclassified	30, 000, 000	32, 000, 000
Total	121, 000, 000	159, 000, 000

[1] Included under "Unclassified."

It is estimated that about 65 percent of the silver consumed in the United States in 1943 went into war production or for purposes classified as essential by the War Production Board. Important gains were registered in the use of silver in silver-lead solders to conserve tin in the lead-tin soft solders; in brazing alloys for joining parts of ships, planes, tanks, guns, bombs, shells, rockets and torpedoes, field kitchens, and many other items; and in highly important dental and medical work. Military photography continued to absorb large quantities of silver, as did silverware for the armed forces.

Two new interesting applications of silver have been announced recently. The first, discovered by the Sunshine Mining Co. and developed by the Rare Metals Institute, is a method of converting sea water into palatable drinking water through use of silver chemicals. The second, developed by E. I. du Pont de Nemours and Co., uses silver powder in a new ceramic-type composition as a coating on electrically nonconducting materials, such as glass and wood, to give the surface high electrical conductivity and low electrical resistance.

The following table shows the net industrial consumption of gold and silver in the United States for the 5-year period 1939–43, inclusive, in terms of dollars for gold and fine ounces for silver. The quantity of each metal reclaimed and recovered from various sources is deducted from that issued for industrial use to give the net amount.

[1] Excess of exports.

DOMESTIC SUPPLY

In 1943 base-metal ores continued to increase in importance as sources of gold and silver, and dry and siliceous ores declined. Likewise, placers were relatively much less important as a source of gold than in 1942.

Mine production of gold in the United States, 1939–43, by percent from sources, and in total fine ounces [1]

Year	Percent from—						Total fine ounces
	Placers	Dry and siliceous ore	Copper ore	Lead ore	Zinc ore	Zinc-lead, zinc-copper, lead-copper, and zinc-lead-copper ores	
1939	28.6	59.8	10.1	0.3	(2)	1.3	4, 673, 042

MINE REPORT

METHOD OF COLLECTING STATISTICS

The second table in this report presents the official refinery figures for production of gold and silver in the United States from 1937 to 1941, as agreed upon by the Bureau of the Mint and the Bureau of Mines. These figures record the output of gold and silver bullion from domestic ore in marketable form as metals, either refined or unrefined.

To trace the gold and silver produced back to its source by States, counties, and mining districts, the Bureau of Mines systematically investigates the "mine production" of ores containing gold and silver and the output of the placer mines, the total being classified by methods of production and by kinds of ore, as well as by mining districts. The resulting figures form the basis of the mine reports.

Of the two systems for ascertaining the production of gold and silver, one is a measure of the metallurgic industry and the other of the mining industry; one reports the metal actually recovered in marketable form and the other the mine output and its recoverable content. The two methods will not produce identical results, but data for a period of years long enough to compensate for overlap or lag should agree within allowable limits of error.

Compared with the mine reports, the mint reports for the 39 years show a total excess of gold of 314,317 ounces (a difference of 0.22 percent) and a total excess of silver of 12,182,219 ounces (a difference of 0.54 percent).

Gold and silver produced in the United States, 1905–43, in fine ounces, according to mint and mine returns, in terms of recovered metals

Year	Mint		Mine	
	Gold	Silver	Gold	Silver
1905–38	119,314,545,	1,960,694,118	119,195,390	1,950,782,707
1939	5,611,171	65,119,513	5,672,485	65,565,024
1940	6,003,105	69,585,734	5,984,163	71,824,746
1941	5,976,419	72,336,029	5,881,798	68,483,333
1942	3,741,806	56,090,855	3,615,836	54,321,962
1943	1,394,522	40,820,639	1,377,579	41,486,897
	142,041,568	2,264,646,888	141,727,251	2,252,464,669

UNITS OF MEASUREMENT

All tonnage figures are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced. Prices of gold and silver are discussed in a preceding section of this report.

MINES PRODUCING

LEADING GOLD MINES

The 15 leading gold producers (each produced more than 17,000 ounces) listed below had an output of 956,676 ounces in 1943 or 70 percent of the United States total (Philippine Islands and Puerto Rico excluded). The output of lode mines and placers producing less than 17,000 ounces each was 407,139 ounces, or 30 percent of the total.

Largest producers of gold in the United States in 1943, in order of output [1]

Rank	Operator	State	Mining district	Source of gold
1	Utah Copper Co	Utah	West Mountain	Copper ore.
2	Homestake Mining Co	South Dakota	Whitewood	Dry and siliceous gold ore.
3	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Copper ore.
4	Golden Cycle Corporation [2]	Colorado	Cripple Creek, etc	Dry and siliceous gold ore.
5	Howe Sound Co	Washington	Chelan Lake	Copper ore.
6	Alaska Juneau Gold Mining Co.	Alaska	Juneau	Dry and siliceous gold ore.
7	Yuba Consolidated Gold Fields.	California	Callahan, Orville, Yuba River.	Dredging gravel.
8	Kennecott Copper Corporation.	Nevada	Robinson	Copper ore.
9	Getchell Mines, Inc	do	Potosi	Dry and siliceous gold ore.
10	Consolidated Copper Mines Corporation.	do	Robinson	Copper ore.
11	United States Smelting, Refining and Mining Co.	Utah	West Mountain	Zinc-lead ore, lead ore, dry and siliceous gold-silver ore.
12	Knob Hill Mines, Inc	Washington	Republic	Dry and siliceous gold ore.
13	Telluride Mines, Inc	Colorado	Upper San Miguel	Dry and siliceous gold-silver ore.
14	Shenandoah-Dives Mining Co.[3]	do	Animas	Do.
15	New Park Mining Co	Utah	Park City	Zinc-lead ore.

[1] Philippine Islands excluded.

[2] Custom mill. Includes mainly ore from Portland, Ajax, Vindicator, and other mines in Cripple Creek district, Colorado, but also from other districts in Colorado.

[3] Custom mill. Includes ore treated from Eureka and Ice Lake districts, Colorado.

LEADING SILVER PRODUCERS

The output of the 34 leading silver producers (each produced more than 180,000 ounces) listed below was 32,023,947 ounces—77 percent of the total mine output of the United States (Philippine Islands and Puerto Rico excluded). The remaining mines produced 9,436,879 ounces, or 23 percent of the total.

Largest producers of silver in the United States in 1942, in order of output

Rank	Operator	State	Mining district	Source of silver
1	Anaconda Copper Mining Co.	Montana	Summit Valley or Butte.	Copper ore, zinc-lead ore, dry and siliceous silver ore.
2	Sunshine Mining Co	Idaho	Evolution	Dry and siliceous silver ore.
3	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Copper ore, dry and siliceous gold and silver ores.
4	Utah Copper Co	Utah	West Mountain	Copper ore.
5	United States Smelting, Refining & Concentrating Co.	do	Ophir and West Mountain.	Zinc-lead-copper ore, zinc-lead ore.
6	Bunker Hill & Sullivan Mining & Concentrating Co.	Idaho	Yreka	Zinc-lead ore, lead ore, dry and siliceous silver ore.
7	Federal Mining & Smelting Co.	do	Hunter and Yreka	Zinc-lead ore.
8	Polaris Mining Co	do	Evolution	Dry and siliceous silver ore.
9	Coeur d'Alene Mines Corporation.	do	do	Do
10	Silver King Coalition Co	Utah	Uintah	Zinc-lead ore, lead ore.
11	Triumph Mining Co	Idaho	Warm Springs	Zinc-lead ores.
12	Tintic Standard Mining Co	Utah	Tintic	Lead ore, dry and siliceous gold-silver ore, dry and siliceous silver ore.
13	New Park Mining Co	do	Park City	Zinc-lead ore.
14	Emperius Mining Co.[1]	Colorado	Creede	Dry and siliceous silver ore.
15	Hecla Mining Co	Idaho	Lelande	Zinc-lead ore, lead ore.
16	Anaconda Copper Mining Co. (Flathead and West Flathead mines).	Montana	Hog Heaven	Lead ore, dry and siliceous silver ore.
17	Magma Copper Co	Arizona	Pioneer	Copper ore- zinc ore.
18	Park Utah Consolidated Mines Co.	Utah	Park City	Zinc-lead ore, lead ore.
19	Combined Metals Reduction Co. (West Calumet and Butterfield mines).	do	Rush Valley and West Mountain.	Zinc-lead ore, dry and siliceous gold ore.
20	Shattuck Denn Mining Corporation (Iron King and Denn mines).	Arizona	Big Bug and Warren	Copper ore, zinc-lead ore, dry and siliceous gold-silver ore.
21	Sherman Lead Co	Idaho	Lelande	Lead ore.
22	Midnight Mining Co	Colorado	Roaring Fork	Dry and siliceous silver ore.
23	Anaconda Copper Mining Co. (Emma and Ophir).	Montana	Summit Valley or Butte.	Zinc-lead ore.
24	Sullivan Mining Co	Idaho	Hunter	Do.
25	Philipsburg Mining Co	Montana	Flint Creek	Dry and siliceous gold ore, dry and siliceous silver ore.
26	Combined Metals Reduction Co.	Nevada	Pioche	Zinc-lead ore.
27	St. Joseph Lead Co	Montana	Barker	Do.
28	Desert Silver, Inc	Nevada	Silver Peak	Dry and siliceous silver ore.
29	American Smelting and Refining Co.	Utah	Tintic	Dry and siliceous ore.
30	Chief Consolidated Mining Co.	do	do	Zinc-lead ore, lead ore, dry and siliceous gold-silver ore.
31	American Smelting and Refining Co. (Trench and Flux Unit).	Arizona	Harshaw	Zinc-lead ore.
32	Kennecott Copper Corporation.	Nevada	Robinson	Copper ore.
33	Mike Horse Mining and Milling Co.	Montana	Heddleston	Zinc-lead ore.
34	Clayton Silver Mines	Idaho	Bayhorse	Do.

---

[1] Comprises output from all the Creede district including custom ore from sublesses.

NUMBER OF MINES

The following table indicates the number of mines that produced gold and silver in 1942 and 1943. The placers are those in which gold and silver in natural alloy and, in a few placers, platinum are recovered from gravel and sand, whether by hand washing, sluicing, hydraulicking, drifting (in frozen ground or ancient buried river channels), or dredging. The lode mines are those yielding gold and silver from ore as distinguished from gravel, mainly from underground workings, and include those that yield ore mined chiefly for copper, lead, or zinc but that contribute the precious metals as byproducts.

The enumeration of placer mines is less satisfactory than that of lode mines, because some are operated only temporarily and are individually small. As far as possible the unit, as for lode mines, is not the operator but the mining claim or group of claims.

Number of mines in the United States producing gold or silver, 1942–43, by States

State	Lode		Placer		Total	
	1942	1943	1942	1943	1942	1943

[1] Philippine Islands and Puerto Rico excluded.
[2] Less than 0.5 percent.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The best index of lode mining is the quantity and metallic content of ore mined rather than the number of mines or operators. The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that yielded gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1943. The individual State chapters from which these tables were compiled contain additional tables and text on the subject and may be found elsewhere in this volume.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little lead or copper that by itself in quantity it would not satisfy the requirements for the smelter charge in lead smelting or copper smelting, respectively. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present), or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

Siliceous (silica [7] in excess of iron) gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry and siliceous ores" thus, by elimination, include both dry siliceous and irony, but chiefly siliceous, ores valuable for their gold and silver content, regardless of method of treatment, and dry fluxing ores carrying considerable quantities of iron and manganese oxides, or iron sulfide, and very small quantities of gold and silver. Dry and siliceous gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made arbitrarily on a basis of value, using the rule that the metal of lower value is not used in the bimetal classification unless its value is equal to or over one-quarter of the combined value of the gold and silver.

---

[7] Except where mineralization approaches a matte, ores in their natural state generally contain more silica than iron and usually are highly siliceous

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report unless otherwise indicated.

[1] Illinois, Michigan, Missouri, Philippine Islands, and Puerto Rico excluded.

[2] Less than 0.0005 ounce per ton.

[3] Includes zinc-copper ore from Arizona, California, and Washington and zinc-lead-copper ore from Arizona and Utah.

[4] Includes 39,465 tons of zinc slag from which no gold and silver were recovered.

[5] Includes 225,261 tons of zinc slag which contained some silver but no gold.

[6] Includes 109,042 tons of zinc slag from which gold and silver were recovered.

[7] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Gold and silver produced in the Western States of the United States, 1848–1943, and in Alaska, 1880–1943, in terms of recovered metals

[Original research, 1848-1903, by Chas. W. Henderson; 1904-43, Economics and Statistics Service]

PLACERS

Dredging.—Placer gold is obtained largely from gravels handled by connected-bucket floating dredges, which recovered approximately 69 percent of the total output from placers in the United States (Philippine Island and Puerto Rico excluded) in 1943 and 68 percent in 1942. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1943 is recorded as 19,183,997 ounces, originating by States as follows: California, 11,633,915 ounces; Alaska, 5,176,618 (including the production from single-dipper dredges and some gold by hydraulicking); Montana, 704,662; Idaho, 612,271; Colorado, 455,195; Oregon, 467,046; and other States, 134,295.

The following tables show the connected-bucket floating dredges operated in the United States in 1942–43 and the gold produced by them in 1939–43.

Additional information on gold output by other placer-mining methods may be found in the State reviews in this volume.

[1] Colorado, Idaho, Montana, Nevada and Oregon.

EMPLOYMENT AND PRODUCTION IN 1942

Outstanding features in employment and production in gold and silver mines in the United States in 1942 compared with 1941 were the closing of nearly half of the mines; a reduction of nearly 50 percent in the average number of employees; a decline almost as great in the number of man-hours of labor performed; slight increases in the number of operating days per mine, the average workyear per man, and the number of tons of ore produced per mine; and a reduction in the number of man-hours required to mine a ton of ore.

Number of mines.—All sections of the country experienced pronounced declines in the number of gold and silver mines operating in 1942. For the whole United States the number producing gold ore and gold-silver ore fell 51 percent from 1941; silver ore 45 percent; and all gold and silver ores, 50 percent. New Mexico showed the greatest reduction, 63 percent. The severest slump was in the group of small mines—those employing only a few men and producing at most only a few hundred tons of ore annually.

Tons of ore produced per mine.—Even though half of the mines producing gold and silver ores in 1941 did not operate in 1942, the half that did operate had a greater average output of ore per mine than all the mines that produced in 1941. This was because many of the smaller mines closed, leaving the larger ones to carry the load of production. Increases in average output per mine were registered in Arizona, California, Colorado, Idaho, Nevada, South Dakota, Washington, and the Eastern States; declines were noted in Montana, New Mexico, Oregon, Texas, Utah, and Alaska. For the whole United States the increase was from 4,829 tons per mine in 1941 to 6,334 tons in 1942, a rise of nearly 24 percent.

Operating time (days per mine).—In normal years hundreds of small gold and silver mines operate only for a few weeks in the year. In 1942 most of these failed to open so that the effect was to increase the average number of days worked by the remaining mines. States showing increases were Arizona, Colorado, Idaho, Nevada, Utah, and Washington; decreases, California, Montana, New Mexico, Oregon, South Dakota, Texas, Eastern States, and Alaska. For the entire United States, in 1942, the average gold and silver mine operated 248 days compared with 239 in 1941.

Average workyear per man.—Although the number of employees and man-hours expended in mining gold and silver ores decreased greatly in 1942, the workyear per man increased. The workyear declined for gold ore but increased for gold-silver and silver ores, so that for the whole industry the number of hours increased from 1,916 in 1941 to 1,986 in 1942. Marked decreases occurred in New Mexico (1,860 in 1941; 1,209 in 1942), Texas (2,450 in 1941; 1,663 in 1942), and the Eastern States (2,522 in 1941; 1,794 in 1942), and smaller decreases in California, Montana, Oregon, South Dakota and Alaska.

Average number of men.—Workers in the gold and silver lode mines were only a little more than half as numerous (53 percent) in 1942 as in 1941. Oregon experienced the greatest loss (75 percent) and Texas the least (less than 4 percent). Placer workers declined 37 percent.

Man-hours.—Closely paralleling the decline in employees was the decline in man-hours of labor performed (45 percent for the country as a whole). The drop was greatest in Oregon (79 percent); New Mexico followed closely, with 68 percent. Although the number of employees in Washington fell 35 percent, man-hours of labor performed dropped only 8 percent. No other State approached this low figure. Texas, with a reduction of less than 3 percent in average number of employees, experienced a slump of nearly 35 percent in man-hours of labor performed.

Man-hours per ton of ore mined.—In the majority of States, mining 1 ton of gold and silver ores required fewer man-hours in 1942 than in 1941, probably due in considerable part to curtailment or stoppage of development brought about by labor shortages, so that employees devoted a greater proportion of their time to removing ore from the mines.

Employment and production in gold and silver lode mines and mills in the United States in 1942, by classes of ore and by States or regions

[1] Preliminary world gold-production table prepared with revisions and adjustments by B. B. Waldbauer and S. M. Anderson, Foreign Minerals Division, Bureau of Mines, in cooperation with the Office of the Director of the Mint. Figures used were derived in part from the Statistical Yearbook of the League of Nations and from the American Bureau of Metal Statistics. No official statistics are issued by Government of U. S. S. R., consequently figures released by the various authorities vary widely and are irreconcilable. In some countries accurate figures are not possible to obtain owing to clandestine trade in gold.

[2] Refinery production.

[3] Imports into United States.

[4] Exports.

[5] Data not available. Estimate included in total.

[6] Approximate production.

[7] Purchases by the State Central Bank.

[8] Conjectural figure published by the American Bureau of Metal Statistics (New York), Annual Issue.

[9] Beginning with 1939, Burmese production included with British India.

[10] Figure published by the Director of the Mint, representing gold of Philippine origin refined but not necessarily mined during the year.

[11] Beginning with 1941, production of Ruanda and Urundi included with Belgian Congo.

[12] Exclusive of nonmembers of the Transvaal Chamber of Mines.

[13] Includes New South Wales, Northern Territory, Queensland, South Australia, Tasmania, Victoria, and Western Australia.

REVIEW BY COUNTRIES

The following paragraphs include figures on the measured and indicated gold reserves of certain countries. These data have been compiled from several sources: Mining directories, company reports, numerous Government publications and mining journals, and information furnished by individuals familiar with certain deposits. For some countries or districts for which little or no information is available, estimates have been made by the Bureau of Mines based mainly upon production in recent years.

CANADA

Output of gold in Canada in 1943 dropped 25 percent below that in 1942 and nearly 32 percent below that in the record year 1941; silver declined 17 percent from the 1942 output. Production of gold from gold-bearing quartz fell, and that from base-metal ores rose, until by midyear base-metal ores were supplying nearly 17 percent of the gold compared with about 12 percent in 1942. Gold continued to be the most important mineral in Canada in point of value. Gold and silver production in 1943 was distributed among the various Provinces as follows:

Province:	*Gold, fine ounces*	*Silver, fine ounces*
Alberta	21	1
British Columbia	240, 530	9, 028, 912
Manitoba	92, 642	567, 141
Northwest Territories	59, 136	13, 134
Nova Scotia	3, 531	144
Ontario	2, 111, 807	2, 651, 777
Quebec	925, 120	2, 259, 442
Saskatchewan	174, 881	2, 657, 315
Yukon	42, 003	53, 073
Total	3, 649, 671	17, 230, 939

The labor situation was the greatest factor in causing reduced tonnages of gold ore, but contributing factors were Government regulations, heavy taxes, and difficulty in obtaining supplies. Employment fell from over 21,000 in January 1943 to about 16,000 in October 1943—a 24-percent decline. An influx of Indians to several camps gave some relief to the labor shortage, although many of the Indians never were able to advance beyond the mucking stage, and the language and income-tax problems presented considerable difficulty. In October the situation showed improvement as men released from war industries began drifting back to the gold mines. In the Kirkland Lake District about 100 families returned to the camps, and it was expected that the summer of 1944 would find labor much more plentiful.

Late in 1942 gold stocks on the Toronto exchange fell to a low figure when rumors were circulated that most gold mines might be closed; but by midsummer of 1943 gold shares established new highs owing chiefly to Allied military victories, proposals for new international monetary systems based on gold, as a hedge against possible inflation, and a general feeling that in the post-war period labor and materials would be plentiful, and gold mining would be very active again. Prospecting increased late in the year, and several promising gold prospects were uncovered to await the turn of events for extensive development. However, many Canadian miners felt that prospecting would be discouraged and capital would not be attracted to develop low-grade deposits until relief was had from the heavy taxes imposed on gold mines.

A survey of the measured and indicated gold reserves of Canada shows a total of about 34,000,000 ounces. It is estimated that 60 percent of this amount is in quartz veins, 5 percent in placers, and 35 percent in base-metal ores. The base-metal ore bodies of the International Nickel Co. of Canada, Ltd., the Noranda Mines, Ltd., and the Hudson Bay Mining & Smelting Co., Ltd., are estimated to contain nearly 11,000,000 ounces of gold. Most Canadian gold camps have been able to develop additional ore as needed, so it seems likely that given favorable conditions the gold industry will thrive many years beyond the period indicated by the present proved reserves.

CENTRAL AMERICA

Honduras.—Compañía Minera Agua Fria, S. A., suspended operations in May 1943 owing to its inability to get priorities on materials from the United States. The New York and Honduras Rosario Mining Co. was granted limited priorities, but several forced, temporary shut-downs interfered greatly with operations, and the quantity of ore milled was the lowest since 1938.

Nicaragua.—Gold mining in Nicaragua in 1943 was hampered by lack of replacement parts for machinery and by a shortage of supplies and miners. Nevertheless, production held up well, and gold exported dropped only 8 percent from that in 1942.

Central American gold reserves.—Much of Central America is difficult to prospect, hence the gold deposits may be very imperfectly known. Proved reserves probably do not total more than 2,500,000 ounces, of which at least half is in Nicaragua alone. Only gold lodes are known to contain appreciable reserves, although reports indicate that placers in Nicaragua may attain considerable importance in the future.

SOUTH AMERICA

Peru.—Output of gold in Peru in 1943 remained at a high level in spite of the unavailability of supplies from the United States. In July the Peruvian Government was notified that supplies and equipment would be furnished gold mines in areas of unemployment or serious economic dislocations.

In 1942 gold lodes and placers supplied about 70 percent of the gold output, and complex ores nearly 30 percent.

Venezuela.—Gold production in Venezuela in 1943 was barely more than half that in the record year 1940. New Goldfields of Venezuela, Ltd., further reduced its staff in September 1943 and was milling about 8,000 tons of ore per month.

Since 1928, lode mines have yielded more gold than placers. In the period 1934–40 lodes supplied an average of 79 percent of total gold output, and placers 21 percent.

South American gold reserves.—The measured and indicated gold reserves in South American countries are placed at about 17,000,000 ounces, of which 35 percent is estimated to be in Colombia, mostly in placers; nearly 25 percent in Peru, mostly in copper deposits; 20 percent in Brazil, mostly in gold lodes; 15 percent in Chile, and 5 percent in remaining countries. Many parts of South America, particularly in certain areas of pre-Cambrian rocks, appear very favorable for further discoveries of gold, and these should prolong appreciably the life of gold mining in those countries.

AFRICA

Union of South Africa.—In spite of shortages of labor and supplies, and increased costs of supplies, the Union succeeded in maintaining gold output in 1943 at a rate only 9 percent less than in 1942. However, lower returns resulted, and in the first half of the year most companies cut their dividend rates, a number passed dividends entirely, a few paid the same as in 1942, and only 1 increased its rate. New capital was difficult to raise, therefore plant expansion and development of new properties were reduced to a minimum. Even so, the future of the industry was viewed with optimism, and gold-mining shares were being bought more and more by the thrifty middle class of people.

The dependence of South African economy on gold mining was stressed in a recent article.[8] Studies tend to show that the economic well-being of the country is, at present, fundamentally bound up with the capacity of the gold mines to produce and distribute revenue, so that the industry directly or indirectly furnishes half of the population with a livelihood and the Government with half its revenues. Even manufacturing and agriculture are secondary industries and could not exist without the revenue produced by gold mining; and no primary industry is in prospect to take the place of the gold industry without serious economic and social dislocations. Prosperity has come to the Union when mining costs in terms of gold have fallen; depression, when they have risen. It is concluded that a policy is needed to insure the industry a long and stable life and that nothing should be allowed to cause the pay limit (the minimum amount of gold contained in a ton of ore which can be mined without monetary loss) of existing or potential gold mines to rise unless it is absolutely unavoidable.

Proved gold reserves in South Africa are the largest of any country on the globe and are placed at not less than 240,000,000 tons of gold ore containing some 57,000,000 ounces of gold. Geologic conditions make it certain that many more millions of tons of ore will be developed as needed, particularly if political and economic factors remain favorable, and if steps are taken to facilitate mining at greater depths than has been practicable heretofore.

Southern Rhodesia.—The proved gold reserves of Southern Rhodesia are placed at not less than 4,000,000 ounces. Some of the larger deposits are those of the Cam & Motor Gold Mining Co., Ltd., Wanderer Consolidated Gold Mines, Ltd., and Bushtick Mines, Ltd.

Gold Coast.—Proved gold reserves of this country are believed to total nearly 9,000,000 ounces, about 80 percent of which is in gold lodes. The remaining 20 percent is largely in the placer deposits of the Gold Coast Selection Trust Co. and the Bremang Gold Dredging Co., Ltd.

Other countries.—Reserves of some 7,000,000 ounces of gold, enough to bring the total for Africa to more than 77,000,000 ounces, are known in other African countries, mainly in Belgian Congo and Tanganyika.

EURASIA

Measured and indicated gold reserves of Eurasia are estimated at 50,000,000 ounces, and it is believed that nearly half of this is in Russia alone. At the time of Pearl Harbor the proved reserves of the Philippine Islands totaled about 3,500,000 ounces. Other reserves of importance are in India, Chosen, Japan, Manchuria, Taiwan, Rumania, and Sweden. So little is known of the gold deposits in some parts of Asia that it is impossible to predict the future for many areas.

---

[8] South African Mining and Engineering Journal, Importance of the Gold Mining Industry to South Africa: Vol. 54, August 28, 1943, pp. 549–555.

OCEANIA

Australia.—The Australian gold-mining industry fared badly in 1943, mainly because of shortages of labor, equipment, and supplies, and output declined 35 percent from 1942. Many important producers closed, among them the Big Bell mine in Western Australia, and others were reduced to a maintenance basis. The result was a pronounced depopulation of inland centers and serious economic dislocations, especially in Western Australia, where great dependence is placed on gold mining.

The proved gold reserves of Australia are estimated at about 11,000,000 ounces, nearly 65 percent of which appears to be in Western Australia. The more important reserves are those held by the Mount Morgan, Ltd., in Queensland, and the Lake View & Star, Ltd., and the Big Bell Mines, Ltd., in Western Australia. Gold ores contain all but a small part of the reserves; placers and base-metal ores are of minor importance.

Other Oceanic countries.—Many gold properties in other Oceanic countries were closed or were operated on a restricted basis in 1943 because of war conditions. The more important deposits are in New Guinea and New Zealand, which together have proved reserves estimated at nearly 4,000,000 ounces. All but a small part of this quantity is in placer deposits, the largest of which is that of the Bulolo Gold Dredging, Ltd., in New Guinea, stated to contain over 1,500,000 ounces of gold. The known combined reserves of Fiji and Tasmania probably total less than 1,000,000 ounces.

GENERAL SUMMARY

In 1943 copper withdrew from its position as probably the outstanding critical metal, and this change crowns with success the efforts of Government, industry, and labor to bring supplies and essential requirements into virtual balance. In January 1944 it was reduced from group I to group II on the eleventh Material Substitutions and Supply List of the Conservation Division, War Production Board. Group I comprises materials the supply of which is insufficient for essential needs and group II those in approximate balance. Copper had been in group I since the first list was issued in March 1942.

The accomplishment of the main objective, however, left little metal available for easing the limitations on consumption for other than war and the most essential civilian purposes.

The chapter on Copper in Minerals Yearbook, 1942, outlined the steps taken by the Government to achieve adequate supplies of copper for war purposes and to hold consumption to a necessary minimum. On the whole, the 1942 program was continued in 1943; and, particularly in the early part of the year, additional restrictive measures were invoked. For the most part, however, the peak of Government action, both of an encouraging and of a restrictive nature, had passed.

Production from domestic mines gained 1 percent over the previous peak in 1943. Monthly mine figures (which have not been adjusted to the annual final total) show that 270,000 tons were produced in the first quarter, 275,000 in the second, 266,000 in the third, and 277,000 in the fourth. The larger outputs at some going mines, such as Morenci and Utah Copper, and new production from those such as the Castle Dome (Arizona) were able to little more than offset declines caused by labor deficiencies. Imports of 402,762 tons of refined metal were slightly above the previous peak of 401,436 tons in 1942. Production in the United States of refined copper from foreign crude materials declined 15 percent in 1943 or to 297,184 tons from 349,769. Deliveries of copper, by producers to customers, which include some metal from scrap aggregated 1,643,677 tons in 1943 so were little changed from the former high record of 1,635,236 tons for 1942. Deliveries by quarters were 415,000, 427,000, 418,000, and 384,000 tons, respectively. Deliveries in the final quarter were 9 percent below the average for the previous three and in December were 17 percent below the average for the preceding 11 months.

The figures presented in the foregoing paragraph led to some belief that the copper position at the end of 1943 had improved sufficiently to make increased civilian consumption possible. The rising stocks of the Metals Reserve Co. at the end of 1943 were viewed by certain persons with concern, and suggestions were advanced that more generous allotments be made for civilian needs.

The easier situation in the last quarter of the year was due in large part to the cut-backs in the small-arms-ammunition program, in connection with which the Army Ordnance Department announced that the Army has enough ammunition "for any crises however unexpected." A statement released by the Office of Civilian Requirements in mid-November was that copper would "definitely be available in fair quantities" for civilian purposes in the near future. In November, too, the War Production Board announced that special copper premium prices, under the plan in effect since May 1, 1943, would not be paid on applications postmarked after December 31. Another outgrowth of the easier situation was the reduction in the work week at certain properties.

Salient statistics of the copper industry in the United States, 1925–29 (average) and 1940–43, in short tons

	Average (1925–29)	1940	1941	1942	1943
New copper produced—					
From domestic ores, as reported by—					
Mines	885, 826	878, 086	958, 149	1, 080, 061	1, 090, 818
Ore produced:					
Copper ore	59, 505, 871	[1] 69,278,476	[1] 78,452,504	[1] 92,285,626	(2)
Average yield of copper, percent	1. 44	1. 20	1. 15	1. 09	(2)
Smelters	892, 730	909, 084	966, 072	1, 087, 991	1, 092, 939
Percent of world total	51	(2)	(2)	(2)	(2)
Refineries	890, 767	927, 239	975, 408	1, 064, 792	1, 082, 079
From foreign ores, matte, etc., refinery reports	317, 287	386, 317	419, 901	349, 769	297, 184
Total new refined, domestic and foreign	1, 208, 054	1, 313, 556	1, 395, 309	1, 414, 561	1, 379, 263
Secondary copper recovered from old scrap only	347, 512	333, 890	412, 699	427, 122	427, 521
Copper content of copper sulfate produced by refiners	4, 601	5, 643	6, 984	8, 076	7. 667
Total production, new and old and domestic and foreign	1, 560, 167	1, 653, 089	1, 814, 992	1, 849, 759	1, 814, 451
Imports (unmanufactured) [3]	391, 212	491, 342	735, 545	764, 393	712, 847
Refined [3]	59, 236	68, 337	346, 994	401, 436	402, 762
Exports of metallic copper [4]	522, 616	427, 650	158, 893	210, 518	294, 497
Refined (ingots, bars, rods, etc.)	482, 868	377, 108	114, 753	131, 732	177, 341
Stocks at end of year	307, 200	334, 500	317, 500	319, 500	309, 500
Refined copper	86, 100	91, 500	77, 500	84, 000	68, 500
Blister and materials in solution	221, 100	243, 000	240, 000	235, 500	241, 000
Withdrawals from total supply on domestic account:					
Total new copper	778, 123	1, 008, 785	1, 641, 550	[5] 1, 678, 091	1, 621, 666
Total new and old copper	1, 288, 700	1, 541, 000	2, 368, 000	[5] 2, 606, 000	2, 708, 000
Price, average ... cents per pound	14. 7	11. 3	11. 8	[6] 11. 8	[6] 11. 8
World smelter production, new copper	1, 761, 000	(2)	(2)	(2)	(2)

[1] Includes old tailings.
[2] Figures not yet available.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[5] Revised due to foreign trade changes.
[6] Exclusive of bonus payments of the Metals Reserve Co.

The improved outlook was not confined to the United States. A report of the Combined Raw Materials Board and the Combined Production and Resources Board stated in September that the new supply of copper and its present actual consumption by the United Nations had reached a rough balance. Shipments of copper from Africa to the United Kingdom, it appears, had been speeded by the resumption of Mediterranean routes. The Board emphasized that the balance depended on maintaining existing and projected production rates of new copper, the collection of scrap, and the acceptance of steel cartridge cases. Rumors early in January 1944 hinted that Rhodesian copper production would be cut 20 to 25 percent.

Early in December 1943, however, Charles E. Wilson, Executive Vice Chairman of the War Production Board, announced a sharp expansion in the general over-all production program for 1944. Certain types of production would be curtailed, he said, but the over-all total called for was 80 percent above the 1942 rate. According to Wilson, the production of small arms ammunition in 1943 would be 142 percent above 1942, but the projected rate for 1944 will be only 60 percent of current production. With respect to artillery ammunition a reverse trend is indicated. Output in 1943 would be 70 percent greater than in 1942, the current rate being 120 percent over 1942, and 1944 requirements called for an average production 25 percent higher than the present rate. Aircraft production in 1944 was expected to be 235 percent higher than the 1942 rate, the merchant ship program 145 percent above 1942, and the schedule for big trucks is twice the 1942 rate. On the other hand, a slight falling off from current rates in ship construction for the Navy was expected, production of ordnance and signal equipment for the ground army was not expected to increase, and the tank program would be 25 percent below 1942. All those items are large users of copper, so upon the basis of the foregoing predictions copper consumption would surely gain in 1944.

Michael Schwarz, who succeeded H. O. King as Director of the Copper Division of the War Production Board, warned early in 1944 that requirements were barely balanced by the supply, based upon maximum and uninterrupted production in the mines, in the refineries, and in the brass and wire mills. He appealed to industry and labor for their utmost contribution to current requirements and said that "If workers leave their jobs during the summer months as they did in the past 2 years there will be a serious crisis." The Board estimated that requirements in 1944 would be 3,378,000 tons compared with supplies from all sources of 3,385,000 tons, obviously providing scant margin for any noteworthy defection in supplies.

That the more pessimistic attitude was justified is borne out by the increased tempo of deliveries by producers after February 1944 and the establishment of a new peak record for May; in the 3 months ended in May the total was higher than for any similar previous period.

In the last months of 1943 and early in 1944 there was a tendency to withdraw some of the restrictions on the use of copper and copper alloys. On the whole, the relaxations affected only highly essential civilian goods where the use of copper provided a saving in manpower or where the use of substitute materials had proved impractical. Permission to coin the familiar copper pennies again, beginning January 1, 1944, responded to overwhelming popular demand. In no case are the relaxations believed to have involved substantial tonnages.

The rumored drop in Rhodesian copper output did not eventuate and the surplus over British Empire needs was reported to be scheduled to come to the United States.

The program for substituting steel for brass in cartridge-case manufacture on the substantial scale mentioned in Minerals Yearbook, 1942, was largely abandoned at the end of 1943 after brass-production capacity had been materially increased. The demand for enormous tonnages of ammunition for immediate training purposes and for future combat reached a peak simultaneously with the most critical stage in supplies of brass. With respect to relieving the pressure on brass supplies at the time and providing adequate ammunition for training purposes, the substitution of steel may be considered to have been successful. It is significant however, that the Army returned to the use of brass at the earliest possible moment. Steel would not have been used if adequate supplies of brass had been available, and on the whole the quantity of steel cases used in actual combat was small. The constant temperature and moisture conditions surrounding the handling of ammunition by the Navy make its use of steel cartridge cases more practical than for the Army, which has to cope with continuous changes. Production of steel cases is being continued by the Army on a limited scale for test purposes and for further development of the art.

The unbalanced relationship between brass casting and rolling capacity in 1943 was solved in part when the Weirton Steel Co. began to roll brass in its steel mill at Weirton, W. Va. Its capacity for rolling brass was said to place it among the leaders in this industry.

The ban on publication of many statistics was lifted at the end of the year, and figures on copper production, shipments, and other items were released. The progress in war production had been such that the data would aid the enemy little, if at all, and surely would not comfort him. It was still inadvisable to publish foreign trade data, and information on Government stocks also continued to be withheld.

Although details covering many countries cannot be obtained, available data indicate that world copper production was virtually the same in 1942 and in 1943 at probably slightly above 3,000,000 short tons. Of the principal producing countries, the United States and Chile had new record mine outputs that—with gains by some smaller producers—offset the declines reported by other large producers. Labor and equipment shortages were the main causes of the decreases noted, although a severe drought was the chief deterrent in Belgian Congo. The production records for the United States and Chile were made despite similar problems.

The increased production capacity at Morenci and Bagdad, the opening of the new mill at Castle Dome, Ariz., new production at the Gray Eagle property, Calif., the new tailings plant at the Quincy mine, Mich., the new projects of the Ohio Copper Co. (the Big Indian, Utah) and the Vermont Copper Co. in Vermont, and other factors that were aimed at larger production are described in the various chapters on gold, silver, copper, lead, and zinc in the different States.

LABOR CONDITIONS

The labor shortages, discussed in the chapter on Copper in Minerals Yearbook, 1942, continued to plague operators of mines, mills, smelters refineries, and fabricating plants in 1943. The Army was called upon in 1942 to stem the downtrend in employment; 4,300 men were released, and 2,300 were allocated to copper mines. The continued critical labor situation led to another "draft" on the Army in 1943, and 4,500 men were released in August and September, of whom 3,200 went to copper mines. As of January 1, 1944, employment in copper mines was reported [1] to be 32,927 men and current labor needs to be 2,717. Reducing turn-over and replacing workers who leave in 1944 were expected to be difficult to accomplish. Labor needs in the 19 principal smelters that employ 20,800 workers were about 1,200 in January 1944. Of this number, 600 were required to allow all departments to operate with normal efficiency, and the additional 600 workers would permit capacity operations. The Commission's report stated that, in addition to these needs, heavy replacements must be made. The nature of the work precludes the use of women, even if they could be recruited.

In authorizing the release of 4,500 men from the Army in July 1943 to accept jobs in the copper, zinc, and molybdenum mines, Acting Secretary of War Patterson said that earlier efforts to recruit additional miners from civilian sources in required numbers had failed and that the success of the 1943-44 military program, as a consequence, "is jeopardized by a growing shortage of these vital metals." The men were to be allocated only for work "in mines of highest productivity located in areas of critical labor shortage. Mines in which the yield of metal per man is relatively small will not be permitted to hire the soldiers who are to be released."

The three predominant copper-producing companies in the United States and in the world—the Anaconda Copper Mining Co., Kennecott Copper Corporation, and Phelps Dodge Corporation—all complained of critical labor shortages in 1943. The furloughing of soldiers by the Army for work in mines eased the problem but did not furnish its solution. Anaconda said that a Miner's Training Program, which prepared inexperienced men for work underground, helped to relieve its situation. Kennecott stated that the corporation plants are located in districts designated by the War Manpower Commission as "vital manpower areas" but that nevertheless difficulty was experienced throughout the year in securing sufficient employees to operate on maximum-capacity schedules. There was no reduction in the tonnage of ore mined by shovels in open-pit operations; but the underground mines, where the labor shortage was felt most severely, reported a substantial decrease in mine output. Phelps Dodge operated all of its branches at capacity "within the limits imposed at times by manpower." According to the American Smelting & Refining Co., because of the shortage of labor some plants were unable at times to operate at much more than 50 to 60 percent of capacity.

A report by Dingman [2] on the training of miners was prepared for the Bureau of Training, War Manpower Commission, and an abstract was published.

STOCK-PILE LEGISLATION

Following World War I the copper industry slumped during the period of universal depression; because the properties of copper make it particularly desirable for many war uses, probably this industry was affected more adversely than most. The chapter on Copper in Mineral Resources 1921 said:

---

[1] War Manpower Commission, Confidential Report on Production and Manpower Situation in Metals and Minerals Industries, March 13, 1944.

[2] Dingman, Oscar A., Training Miners for Greater Copper Production: Min. Cong Jour., vol. 29, No. 6, June 1943, pp. 20-27.

> * * * The production, though greatly reduced as compared with that of the preceding 4 years, largely exceeded the withdrawals, and the year 1921 began with the smallest consumptive capacity in about 15 years, the greatest stocks in the history of the industry, and a selling price of nearly 2 cents a pounds less than the weighted average cost of production for the year 1920, exclusive of depletion. If depletion charges are taken into account, the selling price on January 2, 1921, was above 5 cents less than the weighted average cost of production in 1920. Under such conditions it was inevitable that production should practically cease until the enormous stocks were absorbed, the cost of production lowered, and the selling price increased sufficiently to permit operation without loss. Accordingly, by April 1, 1921, nearly all the large companies had discontinued operations. The extent of the shutdown can best be realized by a comparison of the smelter production in 1921 with that of previous years. It was followed by an investigation of the industry by the Department of Justice on account of suspected violation of the Sherman Act. It was obvious, however, that continuation of mining under the prevailing conditions could only lead to bankruptcy for many companies and the useless exhaustion of a wasting asset of great national importance at the cost of mining or less for the industry as a whole.

Legislators, industry as a whole, and labor desire to prevent a recurrence of the mining conditions of the period following the First World War. The armament requirements of the second world conflict are such that the possibilities of the present situation far overshadow those that attended the first. A stock-pile bill (S.1160) was introduced in Congress by Senator Scrugham of Nevada on June 3, 1943. Representatives of Government, industry, and others presented their views before the committee; they were generally in favor of the theory of stock-piling, although they disagreed in part with some of the features of the bill. Opinions of Harold L. Ickes, Secretary of the Interior, Howard J. Trueblood, Office of Advisor on International Economic Affairs of the Department of State, Julian D. Conover, Secretary of the American Mining Congress, and others were published in Metals.[3] R. R. Eckert, Secretary of the United States Copper Association, voiced the sentiment of the copper industry in favor of stock-piling metals after the war. He suggested an eight-point program, as follows: .

1. The United States should retain possession of all copper owned or controlled by it, in whatever form, including ore, concentrates, materials in process of smelting, refining, or fabricating, copper in commercial form and all scrap copper such as exploded shells, copper wire from the demolition of buildings and the scrapping of worn-out tanks, jeeps, etc.
2. The Government should fulfill all copper purchase contracts in whatever form in existence at the termination of the present emergency.
3. The Government should acquire all surplus stocks of copper owned by producers and fabricators on hand at the end of the war, in excess of normal working stocks and quantities required for commercial use.
4. For a transition period of not less than 6 months and perhaps not more than 1 year following the cessation of hostilities, the Government should acquire all copper produced by mines of the United States in excess of the tonnage required for commercial use.
5. For the same period of 6 months to 1 year, the Government should acquire the copper produced by Latin American mines in excess of the tonnage marketed in foreign countries.
6. For a period of 18 months following the cessation of hostilities, the Government should acquire, or retain if already owned, all scrap copper, in whatever form, as may be offered for sale within territorial United States, if in the opinion of Army or Navy officials, such scrap resulted from hostilities in the present war with Germany, Italy, or Japan.

---

[3] Metals, vol. 14, No. 3, September 1943.

7. All ore, concentrates, scrap, and material in process at smelters and refineries should be processed to refined copper. All finished goods at fabricating or munitions plants or arsenals should be retained by the Government, if, in the opinion of Army or Navy officials, they are suitable for present equipment. All goods in process of fabrication, depending upon its character and the degree of processing already completed, should (*a*) be finished and stored in arsenals or (*b*) returned to the refineries and processed to refined copper, as directed by Army and Navy officials.

8. All copper so owned or acquired by the Government should be placed solely under the control of the Secretary of War and the Secretary of the Navy for storage and stock-piling at such strategic points or places as they may direct and should be held intact for a war emergency.

S.1160 was revised and reintroduced on December 8, 1943, as S.1582.

INVESTIGATIONS OF THE GEOLOGICAL SURVEY AND THE BUREAU OF MINES

The Geological Survey program of investigations of copper resources was continued actively throughout 1943. As in the preceding year, some studies were made of inactive minor districts offering possibilities for production, but attention was directed increasingly toward problems of ore supply in producing districts. Several studies were conducted in conjunction with exploration projects of the Bureau of Mines, and numerous individual copper deposits were examined during the year at the request of other Government agencies. The Geological Survey investigations included copper deposits in Alaska and Mexico, as well as in the continental United States.

During 1943 geologic investigations in the United States were undertaken in Vermont, New Jersey, the Southeastern States, Michigan, the Colorado Plateau, New Mexico, Montana, Washington, Idaho, the foothill region in California, and the Castle Dome, Bagdad, and Christmas mines and the Old Hat and Helvetia districts in Arizona.

Preliminary geologic maps of the North Keystone mine, California, the Elizabeth mine area, Vermont, and the Steeple Rock district, New Mexico, were released for public distribution. Preliminary reports on studies of the White Mesa and Old Hat districts, Arizona, the Organ district, New Mexico, the Elizabeth mine, Vermont, and the Hazel Creek mine, North Carolina, were placed in the open files.

In Alaska during 1943 the Geological Survey continued its investigation of the iron-copper deposits on the west side of Kasaan Peninsula and the Salt Chuck copper-palladium mine (Prince of Wales Island). A magnetometer survey was made of a part of a nickel-copper deposit at Bohemia Basin (Yakobi Island). The Rua Cove copper deposit in the Prince William Sound region was examined, as were copper deposits in the Kotsina-Kuskulana district and the Nizina district. Moreover, information regarding most of the old mining areas in the Prince William Sound region was collected.

The Geological Survey also investigated in 1943 several copper deposits in Mexico under the auspices of the United States Department of State.

During the calendar year 1943 the Bureau of Mines operated 26 copper-exploration projects in 13 States; 10 of these operations were carried over from the previous year.

These properties and their locations follow: Stone Hill mine, Cleburne and Randolph Counties, Ala.; Twin Buttes and Control mines, Pima County, San Manuel and Old Reliable mines, Pinal

County, Christmas mine, Gila County, and Zonia mine, Yavapai County, Ariz.; West Belt area, Calaveras and Amador Counties, and Blue Ledge mine, Siskiyou County, Calif.; Colorado Copper Co. mine, Montrose County, Colo.; Empire mine, Custer County, and the Uncle Sam mine, Blackbird district, Lemhi County, Idaho; Hidden Treasure mine, Clinton County, Shamrock mine, Jefferson County, and Green Mountain mine, Sanders County, Mont.; Majuba Hill mine, Pershing County, Nev.; Guadalupe (Stauber) mine, Guadalupe County, Lordsburg district, Hidalgo County, and Red River (Copper King) mine, Taos County, N. Mex.; Ore Knob mine, Ashe County, Union mine, Cabarrus and Rowan Counties, and Durgy mine, et al., Virgilina district, Person and Granville Counties, N. C.; Boston Consolidated mine, Salt Lake County, Utah; Elizabeth mine and vicinity, Orange County, Vt.; Toncrae-Howard mine, Floyd County, Va.; and Rambler mine, Albany County, Wyo.

Exploration by the Bureau on these properties and areas comprised 77,085 feet of drilling, 9,118 feet of trenching, and 1,044 feet of underground drifting. This development indicated approximately 2,000,000 tons of ore containing about 31,500 tons of copper. In addition, 460,000 tons of material containing 6,000 tons of copper were indicated but it cannot be mined under present conditions. Several hundred properties were examined on which no work was done by the Bureau.

Diamond drilling, which was started in 1942 in the Christmas mine, Arizona, was carried on throughout 1943. A substantial tonnage of ore was developed by this exploration, so that mining operations may be continued there for several years because of this augmentation of the nearly depleted ore reserves.

Exploration by the Bureau at the Elizabeth mine, Vermont, was continued from 1942 and completed. Mining and milling resulted in production in October 1943. Geophysical work and diamond drilling were carried on during the summer on the Eureka-Union and the Diamond properties near the Elizabeth.

The project on the Uncle Sam mine, Idaho, started in August 1942, was recessed in March 1943 and resumed in August. Diamond drilling has developed a large tonnage of copper-cobalt ore in a deposit west of the Uncle Sam mine in which 75,000 tons of similar ore were developed last year.

Samples of all the copper ores discovered by these explorations were assayed in several Bureau of Mines laboratories. Ore-dressing tests also were carried out on most of these ores by means of grinding, flotation, log washing, jigging, leaching, and tabling to determine the best method of milling treatment. Considerable research was done on alloys of copper with manganese, nickel, zinc, beryllium, and other metals; the results have contributed largely to the knowledge and application of copper alloys.

POST-WAR OUTLOOK

Throughout the years the consumption of copper has been an index to general industrial activity; it would appear safe to assume, therefore, that in the post-war period the demand for copper will be proportionate to the rate of industrial prosperity. This assumption is not entirely safe, according to some authorities, because of expansion in the use of light metals during the war period, their substitution for copper and its alloys in many uses, and the competitive threat they promise for post-war markets. The consensus, however, seems to be that consumption of copper will be high after the war, dependent, of course, on the expected era of prosperity that should follow the conversion of industry in general to peacetime pursuits, the filling of pent-up civilian needs, and rehabilitation activity in many parts of the world. In the first half of 1944, Arthur D. Whiteside, president of Dun & Bradstreet and previously Vice-Chairman for Civilian Requirements of the War Production Board, commented that despite the many uncertainties it will face at the end of the war, business will enjoy 3 to 5 of the most prosperous years it has ever had. The question then would seem to be: How much of its normal market can copper reclaim? The general belief is that most consumers will return to the use of copper after the war because of its greater efficiency, because of industrial habit, or both. Price, as always, will be a determining influence. Even should aluminum have a favorable competitive position pricewise after the war, it would still be unlikely to compete where size is a factor. Copper will undoubtedly continue to be in demand for the many thousands of motors, and telephone and other electrical equipment of all kinds that will be required by a strong post-war market. Electrical equipment of all kinds took about half of the pre-war copper consumed. Building, exclusive of electrical apparatus, took 89,000 tons of copper in 1939, according to the American Bureau of Metal Statistics. According to the F. W. Dodge Corporation the total construction volume in the 10 years following the war will average approximately double the average annual volume of the 1930–39 decade, which was a period of depression and slow recovery. Automobiles (other than for starter, generator, and ignition equipment) took 85,000 tons of copper in 1939. Trade estimates indicate that automobile manufacture after the war will average 50 percent over the pre-war rate, at least until the cumulative demand—estimated at 10,000,000 cars—has been satisfied. On the whole, copper consumption in the post-war period is expected to be well above that in pre-war times, perhaps for several years or until the back-log of civilian demands has been filled. On the other hand, it will certainly not equal war requirements for new copper, which in 1941–43 averaged substantially more than double the average quantities used in the period of industrial prosperity of the late twenties (1925–29).

As pointed out in the Engineering and Mining Journal,[4] the transition from war to peace will be more complex for copper than for commodities less intimately associated with the war.

Sullivan[5] suggests that a more important problem than the substitution of aluminum and magnesium for copper after the war is "In the next quarter century, where are we going to get enough copper to meet the demands?"

Two political factors will have a sharp bearing on the post-war demand for newly-mined copper: First, the Government attitude toward stock-piling copper on hand at the end of the war in the forms of (1) refined metal, (2) intermediate war materials, and (3) scrap returned from battlefields and scrap from obsolete equipment of all kinds; and second, the Government attitude toward permitting entry into the country of foreign crude, refined, and fabricated copper.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled upon a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better for showing the actual recovery of metal and fairly accurate for showing the source of production; and refinery statistics give precise information regarding metal recovery but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of United States, 1930, part 1, discusses the differences among the three sets of figures.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1939–43, in short tons

Year	Mine	Smelter	Refinery
1939	728, 320	712, 675	704, 873
1940	878, 086	909, 084	927, 239
1941	958, 149	966, 072	975, 408
1942	1, 080, 061	1, 087, 991	1, 064, 792
1943	1, 090, 818	1, 092, 939	1, 082, 079

PRIMARY COPPER

Smelter production.—The recovery of copper by smelters in the United States from ores of domestic origin totaled 1,092,939 short tons in 1943, or less than 0.5 percent above the total of 1,087,991 tons for 1942. Domestic smelter output constituted 51 percent of the world production during 1925–29 but dropped sharply in the succeeding years until 1934, when it was only 17 percent. From 1936 to 1940 it fluctuated between 25 and 32 percent, and in 1942–43 it is believed to have been nearly 35 percent.

The figures for smelter production are based upon confidential returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The precise quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930, part 1.

Copper produced in the United States from domestic ores, 1939–43, by States

[Smelter output, in short tons fine]

State	1939	1940	1941	1942	1943
Alaska	152	64	95	33	31

Copper produced (smelter output) in the United States, 1939–43, and total, 1845–1943

[Values rounded]

Year	Short tons	Value
1939	712, 675	$148, 236, 000
1940	909, 084	205, 453, 000
1941	966, 072	227, 993, 000
1942	1, 087, 991	[1] 256, 766, 000
1943	1, 092, 939	[1] 257, 934, 000
Total, 1845–1943	30, 645, 480	8, 994, 713, 000

[1] Excludes bonus payments of Metals Reserve Co.

Mine production.—The figures for mine production are based upon reports supplied to the Bureau of Mines by all domestic mines that produce copper. Details of the method of collecting the statistics and reasons for the discrepancy between mine-, smelter-, and refinery-production figures are given in the Copper chapter of Mineral Resources of the United States, 1930, part 1.

Mine production is more accurate than either refinery or smelter production for showing the distribution of domestic output by States and districts. It also indicates the production by calendar years more exactly, because additional time is required for smelting and refining. Mine production in 1943 was 1,090,818 tons—an increase of 1 percent over that in 1942 and 23 percent above the average for 1925–29.

Production by States and districts.—The following tables show mine and smelter production, by States, for 1942 and 1943 and mine output, by districts, for 1939–43. In 1943 Arizona, Utah, and Montana led in production, with 79 percent of the smelter total compared with 78 percent in 1942; adding the output of New Mexico, Nevada, and Michigan to the foregoing brings the proportion to 97 percent of the total for the country, unchanged from 1942. Arizona produced 36 percent of the total, Utah, 30, and Montana 13. The Arizona and Montana percentages are unchanged from 1942, but that for Utah continued the uptrend of recent years, advancing 1 percent. Montana's tonnage dropped in 1943. The three other States specified (New Mexico, Nevada, and Michigan) represented smaller proportions of the United States total in 1943 than in 1942, as in 1942 they were smaller proportionately than in 1941; all showed tonnage declines also in 1943. On the whole, other States produced less copper in 1943 than in 1942 with the noteworthy exception of California, whose sharp gain was due chiefly to the entry into the ranks of producers of the Gray Eagle Copper Co., operating the Dakin mine, Klamath River district, Siskiyou County. It became by far the largest producer in California. The Keystone mine, Copperopolis district, Calaveras County, increased its output substantially in 1943, also contributing to California's increase. Comparison of present production with that of the past century focuses attention on the rapidly rising production of Utah; this State contributed 30 percent of the total in 1943 compared with 14 percent in the period 1845–1943. Arizona, the principal producing State, continues to supply more than its average for the past century. Michigan and Montana, on the other hand, show sharp defections from their earlier rates. Proportionately, output in New Mexico in 1943 was almost double that for 1845–1943 and that in Nevada was also higher, but the rise was more modest.

Copper produced in the United States according to smelter and mine returns, by States, 1942–43 and 1845–1943, in short tons

State	1942		1943			1845-1943 smelter output

[3] Included under "Undistributed"; Bureau of Mines not at liberty to publish figures.

[4] Less than 1 ton.

[5] Approximate production through 1928. Figures for 1929–43 confidential and included under "Undistributed."

[6] Includes Tennessee for 1929–43.

In maintaining its lead as the outstanding copper-producing district in 1943, for the eighth straight year, Bingham, Utah, produced 2.4 times as much as the Butte (Mont.) district, its nearest rival. Butte ranked second in the eight years, and in total output from the beginning of operations it easily outdistanced all other areas. The Globe-Miami (Ariz.) district appeared fairly well established in third place in recent years, but capacity operations at the Morenci mine, Morenci (Ariz.) district, would offer a severe threat in 1944.

Details of mine production, by districts and companies, in 1943 are available in the chapters of this volume dealing with production of gold, silver, copper, lead and zinc in the various States.

Quantity and estimated recoverable content of copper-bearing ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by mines in the United States in 1942; figures for 1943 are not yet available. Of the total copper produced from copper ores in the United States during 1942, 87 percent was obtained from ores concentrated before smelting, 9 percent from direct smelting ores, and 4 percent from ore treated by straight leaching. The percentages for 1942 compared with 85 percent obtained from concentrated ore, 10 percent from direct smelting ores, and 5 percent by straight leaching in 1941.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that the estimated recoverable tenor is close to the actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only those that contain

2.5 percent or more copper but also those that contain less than this percentage if they are valuable chiefly for copper. Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

Copper ore, old tailings, etc., sold or treated in the United States in 1942, with copper, gold, and silver content in terms of recovered metals

State	Ore, old tailings, etc., sold or treated (short tons)	Copper produced		Gold produced (fine ounces)	Silver produced (fine ounces)	Value of gold and silver per ton of ore

Refinery production.—The refinery output of copper in the United States in 1943 was made by 11 plants; 7 of these employed the electrolytic method only, 2 the furnace process on Lake Superior copper 1 the furnace process on western ores, and 1 both the electrolytic and the furnace methods.

Five large electrolytic refineries are on the Atlantic seaboard, three Lake refineries on the Great Lakes, and three electrolytic refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; and one at El Paso, Tex. In 1942, fire-refined copper was produced for the first time at the Hurley (N. Mex.) plant of the Kennecott Copper Corporation, and output of this grade was almost doubled at the plant in 1943. The El Paso plant of the Phelps Dodge Refining Corporation produced furnace refined copper in addition to the usual electrolytic grade. Of the plants specified above, the Lake refinery of the Quincy Mining Co. has been idle since 1933.

In addition to the foregoing plants, that at Inspiration, Ariz., is equipped to make electrolytically refined copper direct from the liquors obtained from leaching; this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes.

The 13 plants indicated constitute what commonly are termed "regular refineries." Of these plants, 8 employ the electrolytic process, 4 the furnace process, and 1 both methods. The electrolytic plants have a rated capacity of 1,639,000 tons of refined copper a year. As they produced 1,350,000 tons in 1943, this part of the industry was operated at 82 percent of capacity.

The following tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which cast.

Primary and secondary copper produced by regular refining plants in the United States and imported, 1939–43, in short tons

	1939	1940	1941	1942	1943

Grand total	1,142,392	1,499,562	1,841,978	[4]1,901,140	1,904,489

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as accurate separation at this stage of manufacture is not possible.
[2] Some copper from Michigan is electrolytically refined at eastern refineries and is included as electrolytic copper.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Revised due to foreign trade changes.
[5] Includes some secondary Lake copper.

Copper cast in forms in the United States, 1942–43

Form	1942		1943	
	Short tons	Percent	Short tons	Percent
Wire bars	582,000	38.81	473,500	31.53
Cathodes	464,500	30.98	503,000	33.50
Cakes	119,500	7.97	145,500	9.69
Ingots	219,500	14.64	265,000	17.65
Other forms	114,000	7.60	114,500	7.63
	1,499,500	100.00	1,501,500	100.00

In addition to the regular refineries, numerous plants throughout the country operate on scrap exclusively, producing metallic copper and a great variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement on secondary-copper production.

Copper sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 30,700 short tons having a copper content of 7,667 tons in 1943 compared with 31,700 tons containing 8,076 tons in 1942.

The output of copper sulfate by plants other than the regular primary refineries totaled 58,400 tons with a reported content of 14,597 tons in 1943 compared with 73,500 (revised) tons containing 18,390 tons of copper in 1942.

Producers held 10,500 tons of copper sulfate at the beginning of 1943, total production was 89,100 tons, and shipments amounted to 79,900 tons. Some small purchases were made during the year, and consumers used an amount equivalent to almost 10 percent of shipments. Inventories at the year end were 14,300 tons.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1939–43. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary copper produced in the United States, 1939–43, in short tons

	1939	1940	1941	1942	1943
Copper recovered as unalloyed copper	151, 370	170, 839	135, 869	114, 647	137, 883
Copper recovered in alloys	[1] 348, 330	[1] 361, 207	[1] 590, 527	[1] 813, 108	[1] 948, 164
Total secondary copper	499, 700	532, 046	726, 396	927, 755	1, 086, 047
From new scrap	212, 800	198, 156	313, 697	500, 633	658, 526
From old scrap	286, 900	333, 890	412, 699	427, 122	427, 521
Percentage of domestic mine output	69	61	76	86	100

[1] Includes copper in chemicals as follows: 1939, 3,200 tons; 1940, 9.431 tons; 1941, 9,804 tons; 1942, 17,455 tons; 1943, 13,019 tons.

CONSUMPTION

The following table gives figures on apparent consumption of copper in the United States. In estimating apparent consumption it has been assumed that copper used in the manufacture of primary fabrications of copper is consumed. It is likely that statistics compiled upon a different basis (for example, by taking consumption as including only copper made into automobiles, electrical equipment, ships, and other items) would show very different results. Much copper leaves the country as primary fabrications and considerably more in manufactured products containing copper. Actual consumption data may be compiled at many points in the industrial process. The method of calculating the quantity of copper available for consumption is shown in the following table. It should be noted that exports and stocks include some refined secondary copper that cannot be determined separately and also that actual consumption of new copper would differ from the figures shown in the table by the changes in consumers' stocks.

New refined copper withdrawn from total year's supply on domestic account, 1939–43, in short tons

	1939	1940	1941	1942	1943
Total supply of new copper	1,025,779	1,381,893	1,742,303	[1] 1,815,997	1,782,025
Stock at beginning of year	181,000	95,500	91,500	77,500	84,000
Total available supply	1,206,779	1,477,393	1,833,803	[1] 1,893,497	1,866,025
Copper exported [2]	396,406	377,108	114,753	[3] 131,406	[3] 175,859
Stock at end of year	95,500	91,500	77,500	84,000	68,500
	491,906	468,608	192,253	[1] 215,406	244,359
Withdrawn on domestic account	714,873	1,008,785	1,641,550	[1] 1,678,091	1,621,666

[1] Revised due to foreign trade changes.
[2] Includes refined copper in ingots, bars, rods, or other forms.
[3] Excludes refined copper in rods.

STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister and anode copper in transit from smelters to refineries are included under blister copper.

Stocks of copper at primary smelting and refining plants in the United States at end of year, 1939–43, in short tons

Year	Refined copper	Blister and materials in process of refining [1]	Year	Refined copper	Blister and materials in process of refining [1]
1939	95,500	260,000	1942	84,000	235,500
1940	91,500	243,000	1943	68,500	241,000
1941	77,500	240,000			

[1] Includes copper in transit from smelters in the United States to refineries therein.

Total inventories in the hands of smelters and primary refineries dropped 3 percent in 1943, owing to a 19-percent fall in the refined grade offset only in part by a 2-percent gain in the unrefined class.

Figures compiled by the Copper Institute show that domestic stocks of refined, duty-free copper declined in 1943 and were 52,121 tons at the year end compared with 65,309 tons at the beginning. The drop in 1943 is an extension of the continuous downtrend from 289,755 tons at the close of 1938. Stock figures of the Copper Institute and the Bureau of Mines are upon different bases and, as a consequence, never agree. Normally the differences are due in part to the somewhat different coverage and in part to an arbitrary but permissible method used by the Copper Institute in designating the copper as domestic or foreign metal. The latter factor causes a time-lag difference between the two sets of figures. Copper Institute stocks cover duty-free metal only.

Refined metal in the hands of the Metals Reserve Co. totaled 224,081 short tons (of which 57,681 were fire-refined) at the end of 1943 compared with 91,472 tons at the end of 1942. This metal duplicates part of that reported at domestic refineries because the former is upon an ownership and the latter upon a physical basis. The exact amount of duplication cannot be determined, but it is not believed to amount to more than 10 percent of the Metals Reserve total.

The fabricators' inventory position improved in 1943, although it was still represented by a minus quantity. Stocks of refined copper, of copper in process, and in primary fabricated shapes were actually 15 percent smaller at the end than at the beginning of the year; the improved position was brought about by a 12-percent fall in working-stock requirements and by a 24-percent drop in unfilled sales to customers. At their all-time peak, unfilled fabricators' sales to customers totaled 689,177 tons at the end of June 1942. By the end of 1943 they had been reduced by nearly one-third.

Stocks of copper in fabricators' hands at end of the year, 1939–43, in short tons

	Stocks of refined copper [1]	Unfilled purchases of refined copper from producers	Working stocks	Unfilled sales to customers	Excess stocks over orders booked
1939	300, 543	189, 687	184, 833	237, 752	67, 645
1940	339, 376	326, 269	240, 740	414, 892	10, 013
1941	292, 973	241, 335	291, 515	547, 468	−304, 675
1942	414, 668	135, 481	340, 547	613, 005	−403, 403
1943	353, 948	90, 807	299, 796	465, 258	−320, 299

[1] Includes in process metal and primary fabricated shapes. Also includes refined copper held at refineries for fabricators' account.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 1,150,000 tons of copper were delivered to domestic and foreign purchasers (excluding deliveries of foreign copper to the Metals Reserve Co.) in 1943 at an average price (f. o. b. refinery) of 11.8 cents a pound, unchanged from 1942 and 1941. The averages for 1943 and 1942 exclude bonuses paid for overquota outputs of individual mines, which were first applicable to February (1942) tonnages. Bonus payments added 0.3 to 0.4 cent a pound to the average realization for copper in 1942, although revised figures available after 1942 mine values had been calculated showed the bonus increment to have been somewhat higher. The difference was added to the 1943 figures, and upon this basis the bonus average for the year was 1.2 cents. The bonus payments, of course, did not apply to all production or, for that matter, to as much as one-fourth of it in 1943 or one-tenth in 1942. In an address at a meeting of the American Mining Congress, Denver, Colo., January 1944, F. H. Hayes of the War Production Board stated that out of a total production of 1,104,622 tons (differs slightly from Bureau of Mines total), there were 825,713 tons on which no premium prices were paid compared with 986,154 tons in 1942, and 246,612 tons on which premiums were paid compared with 102,435 tons in 1942; 32,297 tons in 1943 were produced under Reconstruction Finance Corporation contracts.

Average monthly quoted prices of electrolytic copper for domestic and export shipments, f. o. b. refineries, in the United States, 1942–43, in cents per pound

[5] No quotations.

Ceiling price limitations of the Office of Price Administration placed on electrolytic and casting copper in 1941 were described in the Copper chapter of Minerals Yearbook, 1941. These ceilings were unchanged in 1942 and 1943, except for l. c. l. sales described in the 1942 report. The bonus plan established to enable the Metals Reserve Co. to buy copper from high-cost properties and from high-cost sections of other mines, beginning February 1, 1942, at 5 cents a pound above the ceiling price, to increase production, and liberalization of the original plan are discussed in the chapter for 1942. The principal change in 1943 was in the downward revision of numerous production quotas to enable a larger portion of total production to partake of bonus benefits, as already indicated. In November, however, it was announced that no applications for special premiums postmarked after December 31, 1943, would be accepted.

Price revisions for scrap items are discussed in the chapter on Secondary Metals—Nonferrous.

The official maximum prices, delivered to consumers' plants, have prevailed in the London market since December 18, 1939:

	Per long ton £	s.	d.
Electrolytic, high conductivity	62	--	--
Fire refined:			
High conductivity	62	--	--
High grade	61	10	--
Minimum, 99.7 percent	61	--	--
Minimum, 99.2 percent	60	10	--
Hot-rolled black wire rods	65	10	--

FOREIGN TRADE [6]

The war has disrupted normal conditions in copper smelting and refining whereby the excess capacities in the United States were used to reduce crude materials from abroad for reshipment from the country as refined metal or as fabricated products. A move toward greater independence in the production of higher grades of copper at sources of the ores is in progress, but the custom reduction facilities of the United States continue in demand. As has been pointed out in previous Minerals Yearbook reports, the war has widely disrupted normal shipping. The Allies needed all possible copper for the construction of armament that could compete with and surpass those built by their enemies, who had spent long years in preparation for war. Shipping equipment was inadequate to bring all materials of all kinds required to the United States, and the dangers of sinking made it necessary to have reserve tonnages for high-priority materials. Consequently stress was laid on obtaining as much refined and blister copper as possible first and then accepting the lower grades. The unprecedented ship-construction program of the United States Maritime Commission and the success of the Allies in reducing the submarine menace improved shipping conditions in 1943. The expanding armament program, however, called for greater imports, and invasion preparations called for unbelievable numbers of bottoms. Refined and blister copper continued high on the shipping priority list, however, and refined metal was received in the United States at virtually the 1942 rate. Imports of unrefined copper in pigs or converter bars dropped 16 percent, probably because of limited periods of shipping deficiency. Virtually all of the refined copper entering the country comes from Chile, which also dominates the blister class to a lesser degree. This same country dominated the two classes in the pre-war period also, but at that time most of Chile's copper was going to Europe. Except for the copper from Africa, which was chiefly to be refined under bond for reexport, there were no significant imports of copper outside of the Western Hemisphere in 1943.

Destinations of exports have shown much greater changes because of the war than have sources of imports, due largely to the fact that after the war began some of our former customers became our enemies, and some were under enemy domination or were unfortunately located neutrals. These conditions eliminated six of the seven chief pre-war buyers of United States copper: Japan, Germany, Italy, France, Belgium, and Sweden. Of the pre-war group, the United Kingdom continues an outstanding customer and now dominates the export market; it received 95 percent of the refined copper (by far the most important export class) shipped out of the country in 1943.

---

[6] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Total imports of unmanufactured copper in 1943 were less than the successive peak rates for 1941 and 1942. Exports of metallic copper gained 40 percent over the relatively low rate for 1942.

As always, the copper-export movement is grossly understated if the totals used cover refined copper and primary manufactures only. The understatement is greater in these astounding war days, when measureless quantities of copper are leaving the country in the form of airplanes, tanks, landing craft, jeeps, ordnance materials, electrical equipment, and other varied items.

IMPORTS

As has already been indicated, refined copper was the most desired class of copper imports again in 1943, and receipts of this type were virtually unchanged from the peak rate attained in 1942, being 0.3 percent higher. The shift from crude to refined grades is brought out boldly by the following comparisons. Imports of refined copper in 1942 and 1943 averaged 33 times the annual average for the 5-year period 1935–39. Refined imports made up 57 percent of the total in 1943, 53 percent in 1942, and only 4 percent in 1935–39. More than 98 percent of the refined copper entered in 1943 came from Chile, from mines controlled in the United States, and 99.8 percent in 1942—or, as a matter of fact, virtually all of it—as has been the case since the 4-cent excise tax was placed on copper in 1932. Copper entered in the form of concentrates, regulus, and pigs and converter bars declined 7, 23, and 16 percent, respectively, in 1943; on the whole, the smaller quantities were shared in by most contributing countries. The largest decline was in receipts of regulus and pigs and converter bars from Belgian Congo, followed by loss in imports of the same classes from the Union of South Africa. Some exceptions to the general trend for the unrefined classes mentioned were as follows: More concentrates were received from Bolivia. Ecuador not only shipped more than twice as much copper to the United States, but the grade in 1943 was chiefly blister copper as against mainly concentrates in 1942. Concentrates from Newfoundland showed a gain in 1943.

Other items in the import picture in 1943 that are worthy of note were the receipt of quantities of concentrates from Cyprus and of pigs and converter bars from Turkey. These entries may signify an easier shipping situation in the Mediterranean, following termination of the African campaign in favor of the Allies. For the first time copper in refined form was received from Peru. The quantity reported as received in 1943 was above the reported capacity of the small electrolytic plant in that country.

Copper (unmanufactured) imported into the United States, 1942–43, by countries, in short tons [1]

Country	Ore (copper content)	Concentrates (copper content)	Regulus, black or coarse copper, and cement copper (copper content)	Unrefined black blister and converter copper in pigs or converter bars	Refined in ingots, plates, or bars	Old and scrap copper, fit only for remanufacture, and scale and clippings

[1] Data include copper imported for immediate consumption plus material entering country under bond.

EXPORTS

Total exports of copper as refined metal and as primary fabricated shapes rose 40 percent in 1943. This move continued the rise from the low levels reached in 1941, when the export total surpassed only those for 1933, 1932, and 1901 of the present century. The chief class of exports is refined copper in bars, ingots, and other forms; of this class 95 percent went to the United Kingdom in 1943. Mexico received less than 4 percent. One feature of export trade in recent years has been the enormous growth in shipments of insulated wire and cable. This class totaled 92,756 tons in 1943, or 54 percent above 1942, which in turn was 119 percent above 1941. The U. S. S. R. received 54 percent of the 1943 total and 53 percent in 1942. The United Kingdom received 12 percent of the 1943 total and less than 4 percent in 1942. All the next most important destinations are significant because of their association with the war—India, Egypt, New Zealand, Australia, and Algeria. The U. S. S. R. was also the principal destination of other wire and primary fabricated shapes. Few of the other items appear to have importance. The chapter on Copper in Minerals Yearbook, 1942, indicated that the principal prewar destinations of United States exports were Japan, Germany, the United Kingdom, Italy, France, Belgium, and Sweden. The United Kingdom is our present best customer, and the others are either enemies or under enemy domination, except neutral Sweden which cannot be considered to have complete independence of action. Sweden would have been glad to get copper from the United States and its failure to obtain any may be credited to Germany's undoubted acquiescence to such a move.

The following table gives the destinations of exports of copper and primary manufactures in 1943. The chapter on Copper in Minerals Yearbook, 1941, contains a table showing exports by countries for 1937 to 1940 that indicates the revolution in flow of copper from the United States since the outbreak in Europe of World War II.

Copper exported from the United States, 1943,[1] by countries, in short tons

	Ore, concentrates, composition metal, and unrefined copper (copper content)	Refined		Old and scrap	Pipes and tubes	Plates and sheets	Wire (except insulated)	Insulated wire and cable	Other copper manufactures
		Bars, ingots, or other forms	Rods						
Algeria		58	102		14	47	35	2,065	(3)
Argentina		5	(2)		42	7	1	108	
Australia		1	5		(2)	3	7	2,475	
Brazil		726	12		73	56	76	402	
Canada		162	189	(2)	183	51	46	1,441	
Chile	1	9	14		28	33	91	618	
China			14		335	23	151	362	
Colombia		154	(2)		10	97	210	697

Total value	$299,232	$36,893,683	$578,806	$133	$10,355,836	$3,161,158	$2,904,797	$53,436,643	$1,120,696

---

[1] Changes in table in Minerals Yearbook, 1942, p. 150, are as follows: Refined bars, ingots or other forms exported to United Kingdom should read 107,949 short tons, other countries 160 tons, total 131,406 tons; old and scrap exported to United Kingdom should read 112 tons, other countries 1,102 tons, total 1,215 tons; insulated wire and cable exported to Egypt should read 8,788 tons, other countries 7,078 tons, total 60,393 tons.

[2] Less than 1 ton.

[3] Figures for quantity not recorded.

[4] United Kingdom of Great Britain and Northern Ireland.

Copper [1] exported from the United States, 1939–43

Year	Short tons		Total value	Year	Short tons		Total value
	Metallic [2]	Total			Metallic [2]	Total	
1939	427, 517	427, 579	$96, 321, 365	1942	210, 518	213, 942	$78, 563, 236
1940	427, 650	427, 944	108, 534, 217	1943	294, 497	295, 737	107, 630, 288
1941	158, 893	158, 905	46, 196, 275				

[1] Exclusive of "other copper manufactures" valued at $863,561 in 1939; $1,584,441 in 1940; $1,493,265 in 1941; $3,759,403 in 1942; and $1,120,696 in 1943.

[2] Exclusive of ore, concentrates, and composition metal; exclusive also of unrefined copper, figures for which are not separable from those for ore and concentrates.

Brass and bronze exported from the United States, 1942–43, by classes

Class	1942		1943	
	Short tons	Value	Short tons	Value
Ingots	268	$85, 342	227	$64, 161
Scrap and old	168	28, 333	6	1, 097

WORLD PRODUCTION

The lifting of some of the secrecy surrounding statistical information in recent months leaves productive activity in most European and Asiatic countries still obscure. As has been pointed out in previous reports, copper is one of the commodities in which the Axis countries are notably deficient. The Allies control all of the largest sources of production, and the expanded output from them has been insufficient to accommodate more than war and most essential civilian needs. Out of probable world totals of approximately 2,800,000 metric tons of newly mined copper both in 1942 and 1943, the Axis had access to not much more than 300,000 tons a year, or possibly as little as 10 percent but surely not more than 13 or 14 percent of the total. The program of the Allied Governments in connection with the use of copper undoubtedly has been on the safe side; and, of course, the Germans and the Japanese were accumulating stocks of metal during years when the Allies were thinking along peaceful lines. Nevertheless, the disparity between the quantities available to the two contestants tells a story of hardship for the Axis that a lengthening war cannot fail to accentuate. Substitution, even to an unbelievable degree, cannot erase the problem copper presents to the Axis Powers. Germany cannot again obtain large amounts of metal from intensive scrap drives at home and in conquered countries and from the robbing of industries and homes in both locations of copper-containing articles that were in use. As Japanese-conquered territory is not highly industrialized, it is not believed to have yielded large amounts of copper in secondary form.

World mine and smelter production of copper, 1939–43, in metric tons

---

[1] Copper content of blister produced.
[2] Data not available.
[3] Copper content of exports.
[4] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only, exclusive of scrap, was as follows: 1939, 646,524 tons; 1940, 824,703 tons; 1941, 876,401 tons; 1942, 987,004 tons; 1943, 991,492 tons.
[5] Figures represent blister copper only. In addition to blister copper, Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from Belgian Congo and would therefore duplicate output reported under the latter country.
[6] Approximate production.
[7] Estimate included in total.
[8] According to Yearbook of American Bureau of Metal Statistics.
[9] Exclusive of material from scrap.
[10] Output from U. S. S. R. in Asia included under U. S. S. R. in Europe.
[11] Smelter product.
[12] Exports of ingots and slabs.
[13] Less than 1 ton.
[14] January to August, inclusive.
[15] January to September, inclusive.

REVIEW BY COUNTRIES

Belgian Congo.—Output of copper dropped from 165,938 metric tons in 1942 to 156,937 tons in 1943. As indicated in the Copper chapter, Minerals Yearbook, 1942, a severe drought lasting several months in the early part of 1943 had threatened to cause a drop of as much as 20,000 tons. A booklet prepared by the Belgian Information Office states that the entire production of copper in the Belgian colonies is controlled by the Union Minière du Haut Katanga, a large company with a capital of 300 million francs. The report indicates that the main concession is some 200 miles long by 30 miles broad and appears to contain over 4½ million tons of copper. The two biggest mines, Prince Leopold and Kambove, are equipped with electric mining gear and automatic decaging equipment. The Jadotsville mill is equipped to handle 100,000 tons of ore a month and produces a 35-percent product. Another concentrating plant is at Kipushi. There is also an electrolytic plant for the production of cathode copper and electric furnaces especially designed to produce copper-cobalt-iron alloys direct from ore in which all three occur.

Canada.—Copper production in Canada has declined continuously since the peak output was attained in 1940; in 1943, 289,491 short tons were produced, according to preliminary figures, compared with 301,831 tons in 1942, 321,658 in 1941, and 327,797 in 1940. The 1943 rate was exceeded also by that for 1939. The quantities for the 5 years beginning in 1939, however, all represented record tonnages in relation to earlier years and were chiefly in response to the British Empire needs for war materials. The falling production is explained largely by the fact that the greater part of Canada's total copper comes from nickel-copper ores and that in recent years more stress has been placed on the production of nickel than on copper. As a result, a record nickel output was made in 1942, and the peak rate was relatively maintained in 1943. The short labor supply in Canada in 1943 therefore tended to have a more adverse effect on copper than on nickel.

In the early part of 1944 negotiations were under way to extend the contracts entered into in 1939 between the chief copper producers and the Imperial Government to the end of that year. The Granby and Britannia mines in British Columbia are under contract through War Supplies, Ltd., with the Metals Reserve Co.

The annual review number of the Northern Miner, December 16, 1943, calls attention to the problems that impeded mining in British Columbia. The shortage of labor interfered not only with immediate production but by forcing a reduction in development work jeopardized future output as well. In January 1943 the Britannia mine was said to have had over 900 men on its pay roll and to have produced 1,100 tons of copper; 6 months later, with a crew almost one-third smaller, production was down to 725 tons. Granby's rate of output had been reduced from over 1,500 tons a month in January to 850 tons when the article was written.

More than half of the copper produced in Canada comes regularly from the nickel-copper mines of the Sudbury district, Ontario. The International Nickel Co. of Canada, Ltd., as usual was the leading producer in Canada as well as in Ontario in 1943. This company directed its central effort toward expanding supplies of nickel. Deliveries of its own copper in all forms totaled 265,000,000 pounds in 1943 compared with 334,000,000 pounds in 1939. The Falconbridge Nickel Mines, Ltd., also in Ontario, produced 6,047 tons of copper in matte in 1943 compared with 5,762 tons in 1942. This copper was equivalent to between 50 and 60 percent of the nickel output in the 2 years.

Quebec is usually the second largest copper-producing Province, and the principal producer therein is Noranda Mines, Ltd. Its Horne mine produced 33,082 tons of copper from 952,665 tons of ore smelted in 1943 compared with averages of 36,753 and 1,043,265 tons, respectively, in the past 10-year period. The smelter treated 1,380,738 tons of ore, concentrates, and slag, including 428,073 tons of custom material, and produced 68,733 tons of anodes. Ore reserves totaled 5,174,000 tons averaging 7.03 percent copper and 17,460,000 tons containing 0.90 percent, plus some siliceous fluxing ore. Waite Amulet Mines, Ltd., produced nearly 25,000 tons of copper in 1943, or substantially the equal of 1942 and 1941 output.

Copper is produced along the Manitoba-Saskatchewan border in the Flin Flon district by Hudson Bay Mining & Smelting Co., Ltd., and by Sherritt Gordon Mines, Ltd. Production by Hudson Bay, including its wholly owned subsidiary, Emergency Metals, Ltd., totaled 48,381 tons in 1943 (a new record rate) compared with 36,572 tons in 1942 and 33,820 tons in 1941. Ore milled aggregated 2,291,628 tons in 1943, 2,189,767 in 1942, and 2,020,232 in 1941. According to the Northern Miner of March 23, 1944, all Provinces in Canada except Saskatchewan have shown a reduction in copper output since 1940. The gain in Saskatchewan is due to the shifting of productive activity on the Hudson Bay ore body that lies astride the boundary line between this Province and Manitoba. As of January 1, 1943, Hudson Bay ore reserves were estimated at 27,378,240 tons, averaging 2.59 percent copper. All available manpower was required for production, to the consequent detriment of reserves. Sherritt Gordon Mines, Ltd., produced 13,480 tons of copper in 1943 compared with 15,326 tons in 1942.

Chile.—As usual, Chile easily ranked second among the copper-producing countries of the world in 1943; it was the only important foreign country to continue to establish new high records. Its mine total for 1943 was 498,722 metric tons, which was close to half of that for the United States and slightly less than double that for Canada, which ranked third. In 1942 Chile produced 489,158 tons and in 1941, 465,467 tons, successive peak records. As has been pointed out in previous reports, the enormous expansion in production of copper in Chile was due to the heavy orders placed by the United States for all possible supplies of this metal to fill its astounding war requirements. Before the war copper from Chile had gone principally to European countries; after the war began, shipment to its usual market presented an insuperable problem, even before Chile broke with the Axis Powers.

The fact that three North American companies produce almost all of Chile's copper is well known. These companies are the Chile Exploration Co., the Braden Copper Co., and the Andes Copper Mining Co., with mines at Chuquicamata, Sewell, and Potrerillos, respectively. Chile and Andes are subsidiaries of the Anaconda Copper Mining Co., and Braden is a subsidiary of the Kennecott Copper Corporation. A recent Bureau of Mines report [7] gave estimated reserves at Chuquicamata as over a billion tons of known and probable ore containing about 2 percent copper, plus a corresponding amount of possible ore. There seems to be little reason to question that this is the largest copper deposit in the world. The mine is situated at an elevation of 9,200 to 10,000 feet, 13 miles north of Calama, a small town in the valley, on the Antofagasta-Bolivia Railway 147 miles inland from the port of Antofagasta. Chuquicamata is also connected with the port of Tocopilla by 100 miles of good automobile road.

The Braden (El Teniente) mine is credited by the report with estimated reserves of 225,000,000 tons of 2-percent sulfide copper, or sufficient for 60 years of normal operation. It is located in the Province of O'Higgins, 30 miles northeast of Rancagua, a town on the longitudinal railway 50 miles southeast of Santiago. Andes reserves are estimated at 75,000,000 tons of ore averaging 2 percent copper, only enough for about 8 years' operation at the present rate. This mine is situated about 75 miles due east of Barquito, the company port in the Province of Atacama.

More details concerning these properties, as well as descriptions of other copper and other mines, are given in the Bureau of Mines report mentioned, as well as discussions on economic conditions affecting all kinds of mining in the country. It states that the copper industry is the source of about one-third of the Government revenue.

A copper-fabricating plant was purchased by Chile in 1943 from the General Cable Co., Pawtucket, R. I. The Engineering and Mining Journal of August 1943 said that it should be ready for production early in 1944 and that its capacity was 12,000 tons a year, but that it would probably operate at only one-third of that rate at first.

Employment in copper mines averaged 20,500 men in 1943 compared with 19,600 in 1942, 18,300 in 1941, and 14,200 in 1936.

A new Metals Reserves Co. contract with Chile was negotiated in March 1944. This contract called for a reduction in price.

Cuba.—Copper production in Cuba amounted to 6,310 metric tons in 1943, marking an extension of the almost continuous decline from the 14,431-ton output for 1938, the peak in recent years. The 1941 annual report of the American Metal Co., Ltd., which owned a 59-percent interest at the time stated that it was impossible to replenish ore reserves in the Matahambre mine (the largest copper producer in Cuba) as rapidly as they were extracted. A recent financial statement on the American Metal Co., Ltd., indicated that the Matahambre investment had been written off its books in 1943. Foreign Commerce Weekly of June 3, 1944, said that the American interest in the mine had been disposed of to the Cuban stockholders. The Metals Reserve contract, at a price above the ceiling quotations, has aided in keeping the property in the productive column. The contract was scheduled to lapse in March 1944 but was extended through June with a reduction in price. Imports of Cuban copper in concentrates into the United States totaled 7,038 metric tons in 1943 compared with 8,044 tons in 1942.

Mexico.—Mine output of 49,774 metric tons in 1943 was slightly below 1942 but virtually at the level for that year. Production from

---

[7] Foreign Minerals Survey, Bureau of Mines, Present Situation in Chile's Mining Industries: Vol, 1, No. 4, March 1944, 40 pp.

1941 to date has been above the rate for the previous 10 years due, no doubt, to the agreements between the Mexican and United States Governments, which have tended to stimulate the outputs of numerous items. Exports of copper (metallic content) aggregated 49,975 tons compared with 50,668 in 1942.

The extension of plant facilities at Cananea, Sonora, by the Cananea Consolidated Copper Co., S. A., subsidiary of the Anaconda Copper Mining Co., mentioned in Minerals Yearbook, 1942, was reported to have progressed satisfactorily in 1943 and to be scheduled for completion in 1944.

Under contract with the Metals Reserve Co., as of November 1, 1942, the Moctezuma Copper Co. mined 294,536 tons of concentrating ore in 1943 compared with 251,986 tons in 1942. In addition, 414 tons of direct smelting oxide ore were produced in 1943. Stopes on the 1,400 and 1,500 levels were brought into production, and the mine was unwatered to the 1,800 level. This company is a subsidiary of the Phelps Dodge Corporation.

Northern Rhodesia.—Copper smelter output in Northern Rhodesia amounted to 251,107 metric tons in 1943 compared with 254,654 tons in 1942 and with 266,605 tons in 1940, the peak year. The better position of the United Nations in regard to supplies of copper at the end of 1943 led to reports that Rhodesian production of copper was to be reduced 20 to 25 percent because of a decision of the British Government to curtail its purchases there. One important factor in the somewhat easier situation was the greatly improved prospect that metal shipments would arrive at their destination, which is a tribute to the United Nations navies. The proposed decrease was said to apply proportionately to N'Kana, operated by Rhokana Corporation, Roan Antelope Copper, and Mufulira. N'Changa's share in the decrease was to be its failure to go ahead with the installation of extra plant facilities requested by the British Ministry of Supply in April 1943. The excess in United Nations supply soon proved to be a myth, however, and plans to reduce production were momentarily sidetracked. Any excess over Empire needs, it was said, would go to the United States.

The Northern Miner of February 3, 1944, points out that ownership of African copper properties is essentially British, but that the American interest through the American Metal Co., Ltd., and the Newmont Mining Co. is large. The American Metal Co., Ltd., owns roughly 32 percent of Roan Antelope Copper Mines, Ltd., and also slightly over 50 percent of Rhodesian Selection Trust, Ltd., which has a 64.07-percent interest in Mufulira Copper Mines, Ltd. Newmont Mining Co., through its substantial holdings in Rhodesian Anglo-American, Ltd., the largest stockholder in Rhokana Corporation, has an indirect but important interest in the Rhodesian field. Rhokana Corporation owns the N'Kana property and has a 32-percent interest in Mufulira Copper Mines and a 47.4-percent interest in N'Changa Consolidated Copper Mines, Ltd.

Peru.—The ready market for copper in recent years has failed to bring forth substantially increased amounts of metal from Peru. Mine output in this country is estimated at about 38,000 metric tons in 1943 compared with 36,572 in 1942 and with an average of 34,370 tons in the 5-year period 1935–39. As usual, the Cerro de Pasco Copper Corporation was the outstanding producer in the country, followed by the Northern Peru Mining & Smelting Co., Compagnie des Mines de Huaron, and Sociedad Minera Puquio Cocha. Cerro de Pasco began to produce electrolytic copper on a small scale in March 1942. This company also completed a new 800-ton daily capacity concentrator in October 1943 and began to treat copper ores there, although the mill was designed originally for lead-zinc ores. The copper content of exports in 1943 amounted to 31,132 metric tons compared with 35,139 tons in 1942. In continuing the over-all metals agreement with Peru, the United States Government arranged to buy until June 30, 1944, all copper produced up to 125 percent of the 1942 output.

Sweden.—As pointed out in Minerals Yearbook, 1942, the Boliden Mining Co. was planning to increase its production to 18,000 metric tons of copper annually. Its copper-plant capacity is reported to be 18,000 tons. Production during 1943 was expected to reach between 16,000 and 17,000 tons. This company entered into an operational agreement in regard to three State mines—Adak, Ravliden, and Bjurfors; in addition, it mines copper ore and copper pyrites from the Boliden, Kristineberg, and Laver mines.

Union of South Africa.—The Messina and O'Okiep mines in Northern Transvaal and Namaqualand, respectively, are the chief sources of copper in the Union. Sinclair[8] says that Messina's average annual output is 10,000 tons of ingot copper and that this output probably will rise. Development has shown proved ore reserves of nearly 3,000,000 tons, containing over 2 percent copper. The Namaqualand mines have produced blister copper containing 99.41 percent copper since 1939. A total of about 3,000 tons of ore is treated daily. The article cited states that the production rate at these mines is likely to be increased. Ore reserves of over 10,000,000 tons, with a copper content of over 2 percent, are in sight. As already stated, the copper output is mainly from the Messina and Namaqua fields, but several smaller producers contribute copper, mainly of a byproduct nature. Three producers are gold operations, the Mamre Gold mine of the Eastern Transvaal Consolidated Mines, The Central mines of the Transvaal Gold Mining Estates, and the Rietfontein mine of the Transvaal Consolidated Lands, all operating in Eastern Transvaal. These companies produce by flotation copper-gold concentrates, which are shipped abroad for further reduction. The Rustenburg Platinum Mines, Northern Transvaal, have byproduct output in the form of copper-nickel matte.

GENERAL SUMMARY

Lead, although an important member of the nonferrous metal group essential to the war program, did not show to advantage statistically during 1943 in comparison with the record-breaking levels attained by other major metals. Consumption of all lead increased slightly in 1943 owing to partial relaxation of Government conservation and limitation orders, but a marked decrease in refinery production and a decline in imports resulted in an excess of requirements over supply. Consequently the large stock of lead built up by the Government in 1942 from heavy foreign purchases—which reached a maximum by the end of March 1943—was drawn upon to make up the deficit. In recognition of the altered situation, the Conservation Division of the War Production Board reclassified lead on the Materials Substitution and Supply List from group III (available as a substitute) back to group II (sufficient to meet war demands plus controlled essential industrial needs). The prospect for the duration of the war foretells a decreasing supply, which, however, will no doubt be adequate under continued control.

Refined primary lead production from domestic and foreign ores and base bullion decreased 21 percent in 1943; the total from both sources was 116,998 tons less than the 1942 output. Year-end stocks at domestic refineries (physical inventory) declined moderately, but consumers' inventories showed a 32-percent gain which reflects the receipts by consumers of enough foreign lead to raise stocks to a more normal working level.

Total imports of lead in all forms during 1943 declined 35 percent, largely in the category of refined lead, the principal source of which was Mexico. Receipts of lead in base bullion were markedly lower owing to the cessation of shipments from Australia.

The established price of 6.50 cents a pound for lead at New York remained unchanged throughout 1943.

---

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For full details of mining operations, see separate reports issued for the various States.

Salient statistics of the lead industry in the United States, 1925-29 (average) and 1939-43, in short tons

	1925-29 (average)	1939	1940	1941	1942	1943
Production of refined primary lead:						
From domestic ores and base bullion	660,525	420,967	433,065	470,517	467,367	401,071
From foreign ores and base bullion	123,104	63,068	100,114	100,450	99,472	48,770
	783,629	484,035	533,179	570,967	566,839	449,841
Recovery of secondary lead	280,000	241,500	260,346	397,416	323,001	341,243
Imports:[1]						
Lead in pigs, bars, and old	4,592	7,139	151,568	274,395	369,254	244,510

[1] Data include lead imported for immediate consumption plus material entering the country under bond.

[2] Includes 25,324 tons of foreign refined lead reexported, according to American Bureau of Metal Statistics; official figures not available.

[3] Includes 3,874 tons of foreign lead reexported in 1942 and 11,258 tons in 1943, according to records of the U. S Department of Commerce.

[4] Data not available.

[5] Average for 8 months; London Metal Exchange dealings suspended for duration of war.

[6] Official maximum price fixed by British Ministry of Supply at £25 per long ton.

Figure 1 shows trends in the domestic lead industry since 1900.

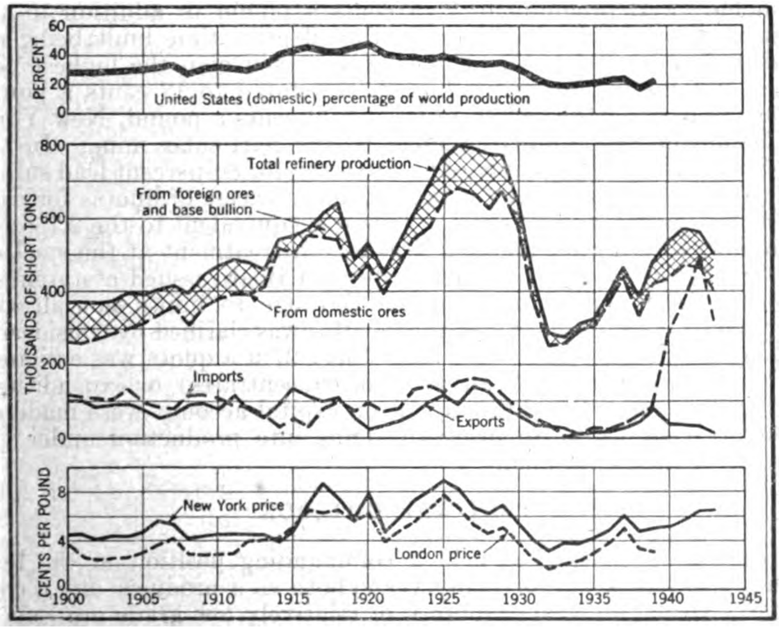

FIGURE 1.—Trends in the lead industry in the United States, 1900–1943. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap lead exported in manufactures with benefit of draw-back. Data on lead exported in manufactures with benefit of draw-back not available for 1943.

WAR AGENCY REGULATIONS

Lead remained under Government control throughout 1943, according to General Preference Order M-38, which provides for the regulation of shipments, deliveries, and a reserve pool for allocation. The original Order M-38, announced in October 1941 and later extended beyond the March (1942) termination date, included supplemental orders M-38-a through j; the last was revoked July 4, 1942. Since the beginning of 1943 four amendments to Order M-38 have been issued, dated January 1, February 2, May 26, and December 24, 1943; all have progressively liberalized the restrictions on the use of lead. Originally the uses of lead, under Conservation Order M-38-c, were divided into three classes—a prohibited list, an unlimited list, and all other uses to be limited in 1942 to 90 percent of consumption in the corresponding quarter of 1941. In the new Order M-38, as amended December 24, 1943, the list of prohibited uses has been retained with some changes, but the essential uses have been freed from all control.

Limitation Order L-180, affecting storage batteries, was amended January 5, 1943, to allow greater use of available antimonial lead and was again amended on January 22, 1944. Similarly Limitation Order L-64 was amended on March 16, 1944, to permit the use of more lead in the manufacture of caskets.

The premium-price plan, whereby producers (miners) of lead (copper and zinc were also included in the plan) receive additional increments above the ceiling price (through Metals Reserve Co.) for overquota production, was maintained throughout 1943. On February 18, 1943, the scope of the Metals Reserve Co. plan was broadened to include a B premium of 2.75 cents a pound in addition to the existing A premium of 2.75 cents, the effective time limit being extended to July 31, 1945. Under this revised plan the highest possible payment for excess production amounted to 12 cents a pound upon the basis of the ceiling price of 6.50 cents a pound, New York, depending on the quotas assigned to the particular mine. In the Tri-State district a premium of $41.80 a ton for 80-percent lead sulfide concentrates was payable for production in excess of quotas for each of the assigned A and B levels. This was equivalent to the 2.75-cent premium, allowing for metallurgical loss in treatment at the smelter. On October 27, 1943, the War Production Board issued a statement denying the premium price in the B range to mines not already operating on that date. Subsequently this was clarified by considering a mine as "already operating" on October 27 if a quota was assigned, the mine shipped metal (lead in ore or concentrates), or expenditures for development, reconditioning, or on capital account were made on or before October 27 to bring the mine into production under the benefits of the quota plan.

POST-WAR OUTLOOK

The United States has held a commanding position in the lead industry of the world for many years, both as a producer and a consumer. Owing to vast resources of relatively low grade ore—made available largely by creating a domestic price based upon a tariff—production from domestic sources supplied nearly the entire domestic demand for primary lead until the advent of the Second World War late in 1939. The subsequent sharp rise in consumption of lead metal and lead in ore for pigments, which reached a peak in 1941, completely overshadowed production from domestic mines, and the balance of necessity had to come from greatly expanded imports, largely in refined form from Mexico. The great influx of foreign lead, for the most part held in Government stock piles in reserve, made unnecessary any greater demand upon domestic lead producers—particularly when all possible supply of labor was being diverted to the mining of more critical metals. Government control of lead consumption, the incentive of premium payments to producers for increased output, and the expanded flow of foreign lead thus has generally kept supply and requirements in rough balance. The pent-up consumer demand to be filled in the post-war years in all probability will result in an annual consumption of lead as metal and in ore of at least 500,000 tons—probably more—for some years, not including the quantity needed for possible Government stock piles now being considered and the lead recovered from secondary sources.

The answers to the questions of the future of Government control and prices cannot be foretold. It is possible that there will be limited control to bridge the gap of industrial reconversion from a war to a peacetime economy and probable that the price of lead will drop. The domestic mines could conceivably fill the demand for new lead for a limited time, given adequate price and tariff protection, but ore reserves have been drawn upon heavily during the war years, and the past partial dependence on foreign lead doubtless will continue in increasing amounts as our resources are drained further.

DOMESTIC PRODUCTION

Pig lead is produced at primary plants that treat ore, base bullion, and small quantities of scrap and at secondary plants that process scrap exclusively. Both types of plants may make refined lead or antimonial lead. Because of the large quantity of hard lead, such as battery scrap melted at secondary smelters, their output is essentially antimonial lead alloys. Figures for the production of refined lead and alloys at secondary plants are given in the section on Secondary Lead. The 16 smelters and refiners in the United States canvassed in 1943 consumed 500,197 short tons (lead content) of ore, only 14 percent of which originated in foreign countries.

REFINED LEAD

Curtailed by labor shortages, scarcity of materials, and smaller imports of ore and base bullion the 10 primary refineries produced only 471,475 tons of refined lead, 19 percent below the 1942 output of 579,695 tons.

Of the 449,841 tons of primary refined lead produced in 1943, 89 percent was derived from domestic ores and base bullion and 11 percent from foreign. In 1942 the origin was 82 percent domestic and 18 percent foreign. Virtually no refined lead was produced from foreign base bullion in 1943. The marked drop from 1942 was due largely to Mexican base bullion being refined in Mexico, plus a lack of Australian material. Australian output was lowered in favor of increased copper and zinc production, and reduced shipments of base bullion were directed to Great Britain. The following table gives the production of refined lead by country of origin of the ore. Details of the sources of lead from domestic ores are given in the section on Mine Production.

Refined lead produced at primary refineries in the United States, by sources, 1939–43, in short tons

Source	1939	1940	1941	1942	1943
Refined lead:					
From domestic ores and base bullion	420,967	433,065	470,517	467,367	401,071
From foreign ores	24,652	83,563	74,166	81,485	48,628
From foreign base bullion	38,416	16,551	26,284	17,987	142

Grand total	484,035	533,179	570,967	566,839	449,841

ANTIMONIAL LEAD

Antimonial lead production at primary refineries increased 23 percent to 63,515 tons in 1943. The distribution of the lead, according to source, is shown in the following table. The antimony content continued to decrease, largely because of the increased quantity of low antimonial lead produced for bullet core rod. In addition to this antimonial lead produced as a byproduct in the refining of base bullion, a much larger quantity was obtained from the smelting of antimonial lead scrap at secondary smelters. Production data from lead-smelting plants handling scrap materials exclusively are summarized in the following section and discussed in detail in the chapter on Secondary Metals—Nonferrous.

Antimonial lead produced at primary lead refineries in the United States, 1939–43

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total
1939	21,995	2,031	9.2	4,117	3,189	12,658	19,964
1940	29,762	2,944	9.9	7,364	3,023	16,431	26,818
1941	40,237	3,510	8.7	14,852	8,013	13,862	36,727
1942	51,762	3,524	6.8	24,512	12,165	11,561	48,238
1943	63,515	3,371	5.3	36,057	17,365	6,722	60,144

SECONDARY LEAD

Although some scrap lead is treated at primary plants, the major part is received at a large number of establishments that handle secondary materials exclusively. Secondary lead is recovered in the form of refined lead, antimonial lead, and other alloys. Secondary lead recovered in 1943 totaled 341,243 tons, 6 percent more than in 1942. The secondary refined-lead production of 58,322 tons comprised 11 percent of the total refined output, and the 176,076 tons of secondary recovered in antimonial lead represented 77 percent of the total. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary lead recovered in the United States, 1942–43, in short tons

	1942	1943
As refined metal:		
At primary plants	12,856	21,634
At other plants	55,746	36,688
	68,602	58,322
In antimonial lead:		
At primary plants	11,561	6,722
At other plants	158,998	169,354
	170,559	176,076
In other alloys	83,840	106,845
Grand total:		
Short tons	323,001	341,243
Value	$40,698,100	$43,679,100

LEAD PIGMENTS

The principal lead pigments are litharge, white lead, red lead, sublimed lead, leaded zinc oxide, and orange mineral. These products are manufactured for the most part from lead ore and metal. Details of the production of lead pigments and salts are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

MINE PRODUCTION

The mine production of recoverable lead (including that made into lead pigments) in the United States and Alaska decreased 9 percent in 1943. Of the 23 States and Alaska where lead is produced, 17 States and Alaska showed a decline. This general drop in output was due to several reasons, including exhaustion of developed ore reserves, manpower shortages, and inefficiency of available replacements for miners taken into the armed forces and those who left for higher-paying jobs in war plants.

Mine production of recoverable lead in the United States, 1925–29 (average) and 1939–43, by States, in short tons

State	1925–29 (average)	1939	1940	1941	1942	1943
Western States and Alaska:						
Alaska	982	937	779	662	415	200

Lead mining is largely centered in three areas—Southeastern Missouri, the Tri-State area, and the Western States (principally Idaho, Utah, Colorado, Montana, and Arizona). The Eastern States supply only a minor proportion of the total. Although output of lead from Southeastern Missouri decreased 18,279 tons in 1943, this district continued to be the largest lead-producing area in the United States and supplied 39 percent of the total domestic production. The Tri-State area (Joplin region), the principal zinc-producing area in the United States, furnished 8 percent of the total United States output and contributed 381 tons more than in 1942 despite the severe floods late in May, which caused the temporary shut-down of many mines in that area. Idaho continued to be the leading producer among the Western States, notwithstanding a decline of 15 percent. Of Idaho's total lead output, the greater part came from zinc-lead ore and old tailings and the remainder largely from lead ore. Utah ranked second among the Western States and third in the United States in lead production, with an output of 65,257 tons of recoverable lead, which was 9 percent less than in 1942. Other principal producing States, in order of productivity, were Colorado, Montana, and Arizona.

Mine production of recoverable lead in the United States, by districts that produced 1,000 tons or more during any year from 1939 to 1943, in short tons

STOCKS

Producers' stocks.—Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by most refiners of secondary material who produce common soft lead as well as foreign lead refined in the United States and entered

Lead stocks at end of year at smelters and refineries in the United States, 1939–43, in short tons

	1939	1940	1941	1942	1943
Refined pig lead	52, 783	32, 458	15, 973	28, 815	28, 821
Antimonial lead	5, 994	8, 468	4, 212	6, 122	4, 269
	58, 777	40, 926	20, 185	34, 937	33, 090
Lead in base bullion—					
At smelters and refineries	10, 337	9, 166	8, 594	7, 359	8, 640
In transit to refineries	3, 521	3, 457	2, 215	1, 706	3, 112
In process at refineries	15, 958	18, 141	17, 709	13, 925	16, 020
	29, 816	30, 764	28, 518	22, 990	27, 772
Lead in ore and matte and in process at smelters	59, 486	71, 722	51, 446	59, 247	68, 678
	148, 079	143, 412	100, 149	117, 174	129, 540

for domestic consumption. Stocks of refined lead and antimonial lead fluctuated erratically from 34,937 tons at the beginning of the year to a high of 38,132 tons at the end of February, and a low of 20,438 tons at the end of June and closed 1943 with 27,996 tons on hand, a net decrease of 20 percent during the year.

The Bureau of Mines survey of primary smelters and refiners in 1943 asked for data on stocks at plants for the first time. The results of this survey showed stocks of refined lead amounting to 39,255 tons (lead content) at plants on January 1, 1943, and 36,464 tons on December 31, 1943. At these same plants primary antimonial lead stocks dropped from 4,631 tons (lead content) to 3,682 tons during 1943. In terms of lead content, stocks of ore at the 16 operating smelters and refineries increased 29 percent from 39,438 to 50,927 tons during the same period. The inventory of base bullion, at smelters only, totaled 6,323 tons at the beginning of January and 8,096 tons at the end of December. No direct correlation can be made between these data and the figures of the American Bureau of Metal Statistics. Figures reported to the Bureau of Mines represent physical inventory at the plants, irrespective of ownership, and do not include material in process or "in transit."

Consumers' stocks.—Approximately 430 consumer plants reported stocks of 108,012 tons of domestic and foreign refined lead on hand December 31, 1943, 32 percent greater than the 81,660-ton inventory held at the end of 1942.

Consumers' stocks of refined soft lead at the end of 1942 and 1943, by grades, in short tons

	Domestic and foreign					Foreign (all grades)
	Corroding	Chemical	Common	Other	Total	
Dec. 31, 1942 [1]	23,113	18,383	37,476	2,688	81,660	6,203
Dec. 31, 1943	23,921	18,706	60,873	4,512	108,012	12,706

[1] Revised figures.

Government stocks.—Industry-owned stocks were augmented by large quantities of lead bought by the Metals Reserve Co. (official Government purchasing agency) and stock-piled for emergency uses. According to reports submitted to the Tin-Lead Division of the War Production Board, Government stocks totaled 173,875 tons of refined lead and 3,267 tons of lead in ore and concentrates on December 31, 1943, compared with 248,361 tons of refined lead and no ore and concentrates held on January 1, 1943.

DOMESTIC CONSUMPTION

A survey of approximately 430 plants in 1943 representing 90 percent of the consumers of refined lead showed a total consumption of 675,465 short tons of refined lead, a gain of 11 percent over 1942. Secondary as well as primary refined lead is included in this figure. Antimonial lead, unrefined scrap lead, and lead in alloys are excluded.

Of the total consumed, 18 percent was used to make red lead and litharge, 17 percent for cable covering, 10 percent for storage batteries, 10 percent for tetraethyl, 9 percent for ammunition, and the remaining 36 percent for a variety of products shown in the accompanying table.

Consumption of refined lead in the United States, 1941–43, by uses, in short tons

	1941	1942 [1]	1943
Ammunition	32,959	48,025	64,023
Bearing metals	10,160	8,466	10,189
Brass and bronze	(2)	5,294	5,748
Cable covering	141,161	128,535	117,802
Calking lead	32,380	9,047	8,618
Casting metals	9,243	3,106	3,072
Collapsible tubes	3,726	9,966	11,425
Foil	51,516	9,359	5,816
Pipe, traps, and bends	32,946	21,411	18,724
Sheet lead	35,480	31,700	27,738
Solder	35,630	13,371	15,472
Storage batteries	73,982	62,604	68,239
Terne plate	2,069	2,336	815
Type metals	2,975	943	812
White lead	83,230	56,476	36,809
Red lead and litharge	143,496	100,563	124,715
Tetraethyl lead	48,327	50,152	65,320
Chemicals and insecticides	8,861	6,298	8,172
Annealing	(2)	5,229	5,987
Galvanizing	(2)	484	819
Lead plating	(2)	(2)	941
Weights and ballast	(2)	(2)	9,269
Other	64,506	33,746	64,940
Total	812,647	607,111	675,465

[1] Revised figures.
[2] Included in "Other."

A distribution by related uses shows 61 percent consumed for metallic products, 25 percent for pigments, 11 percent in chemical products, and 3 percent in miscellaneous uses, such as annealing, galvanizing, lead plating, weights, and ballast. Owing to the demand characteristics of the war, major gains were made in the use of lead for ammunition, red lead and litharge, tetraethyl, and galvanizing, with minor increases for bearing metals, brass and bronze, collapsible tubes, solder, storage batteries, chemicals and insecticides, and annealing.

Reports to the Tin-Lead Division of the War Production Board indicate that the consumption of primary, antimonial, and secondary lead totaled 1,113,000 tons in 1943 compared with 1,043,000 tons in 1942.

The following table has been constructed to calculate apparent

Apparent shipments of refined primary pig lead to domestic consumers, 1939–43, in short tons

	1939	1940	1941	1942	1943
Supply:					
Stocks at primary refineries on Jan. 1	(1)	(1)	(1)	[2] 12,000	39,255
Government-owned stocks on Jan. 1 [3]				17,934	248,361
Production	484,035	533,179	570,967	566,839	449,841
Imports	5,388	149,889	274,189	366,497	244,033
Total available	489,423	683,068	845,156	963,270	981,490
Withdrawn:					
Stocks at primary refineries on Dec. 31	(1)	(1)	(1)	39,255	36,464
Government-owned stocks on Dec. 31 [3]			17,934	248,361	173,875
Exports	74,392	[4] 49,079	14,359	[5] 5,814	[5] 13,261
Total withdrawn	74,392	49,079	32,293	293,430	223,600
Apparent shipments to domestic consumers	415,031	633,989	812,863	669,840	757,890

[1] Official figures not available.
[2] Estimate based upon American Bureau of Metal Statistics data.
[3] According to reports submitted to the Tin-Lead Division of the War Production Board.
[4] Includes 25,324 tons of foreign refined lead reexported, according to American Bureau of Metal Statistics, official figures not available.
[5] Includes 3,874 tons of foreign refined lead reexported in 1942 and 11,258 tons in 1943, according to U. S. Department of Commerce.

shipments to domestic consumers by adding primary production, net changes in stocks, and excess of imports over exports. The apparent shipments of 757,890 tons are probably more nearly correct than the actual receipts of 701,817 tons reported by the consumer plants, because of incomplete coverage in the survey.

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced in this country is sold at prices normally based upon quotations in these markets. Since suspension of the London Metal Exchange dealings in September 1939 for the duration of the war the London market has had no actual influence on New York quotations, and the differential between St. Louis and New York prices has remained at 0.15 cent a pound, an amount approximating the freight charges between the two points.

The ceiling price for common lead—6.35 cents a pound, St. Louis, and 6.50 cents, New York—remained unchanged throughout 1943. For comparison it is interesting to note that the average price received by the primary producers for all grades of lead sold in 1943 was 6.4 cents a pound, f. o. b. plant (6.3 cents in 1942). The 1943 price of 7.5 cents for lead, which appears in the separate State chapters, represents the above weighted average price received for refined lead plus the increment—in terms of cents per pound based upon the total recoverable lead output—of $10,200,000 in overquota premiums paid by the Metals Reserve Co. A brief outline of the 1943 developments of the premium-price plan is given in this chapter under the heading, War Agency Regulations.

The official London maximum price of £25 per long ton, duty paid, for Empire and foreign lead, remained unchanged during 1943.

Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1941–43, in cents per pound [1]

Month	1941			1942			1943

[1] St. Louis: Metal Statistics, 1944, p. 477. New York: Metal Statistics, 1944, p. 471.

[2] London Metal Exchange dealings suspended for duration of war. Official maximum price fixed by British Ministry of Supply at £25 in December 1939.

FOREIGN TRADE [2]

During 1943 imports of lead continued at a high rate but not to the extent of the record receipts of 1942. A substantial part of the total pig lead imported in 1942 came from Australia and Canada under Metals Reserve Co. contracts. The termination of these contracts resulted in cessation of imports early in 1943, and none is now available from these countries. The significant feature of the decline in total imports—the first break in the upward trend since 1936—was the resultant lowering of the available new supply below the level necessary to meet requirements, with consequent greater drain upon Government stocks of refined lead. The great dependence of our wartime program on imported lead is demonstrated by the fact that lowered imports to a large extent were responsible for returning lead to group II of the Materials Substitution and Supply List from the group III position it held in 1942, when it was available for essential needs and as a substitute metal.

Imports.—Total imports of lead in 1943 were 35 percent less than in 1942, largely because of a decline in imports of pig lead amounting to 34 percent. Receipts of lead in ore and matte, which constituted 22 percent of the total, were 12 percent under 1942, and imports of lead in base bullion were only about one-tenth as large as last year. In the refined-lead category, Mexico furnished 87 percent, Peru 8 percent, Australia between 3 and 4 percent, and Canada less than 1 percent, compared with 52, 6, 23, and 19 percent, respectively, in 1942. Nearly all imports of base bullion (84 percent) came from Australia (98 percent in 1942) during January and February. Almost the entire amount remains in stock and has yet to appear as refined metal from this source. As in 1942, lead in ore and matte came from numerous sources; the principal countries of origin were Australia, Africa, and Newfoundland, which together furnished 71 percent of the total imports of this material.

Total lead imported into the United States, 1939–43, by forms in which imported, in short tons [1]

Year	Lead in ore and matte	Lead in base bullion	Pigs, bars, and old	Total lead content
1939	30, 842	48, 902	7, 139	86, 883
1940	111, 300	19, 624	151, 568	282, 492
1941	82, 115	24, 704	274, 395	381, 214
1942	79, 362	43, 855	369, 254	492, 471
1943	70, 023	4, 583	244, 510	319, 116

[1] Data include lead imported for immediate consumption plus material entering country under bond.

Total lead imported into the United States, in ore, base bullion, and refined, 1939–43, by countries, in short tons [1]

Year	Canada	Mexico	New-foundland	South America [2]	Europe	Other countries	Total
1939	5, 641	52, 059	1	16, 527	1, 971	10, 684	86, 883
1940	8, 721	149, 493	27, 563	63, 120	3, 891	29, 704	282, 492

1943	236	69	330, 824	3, 703	3, 422	447, 019

Exports.—Under the restrictions of the Export Control Act of 1940, exports of pig lead in 1943 (excluding reexports of foreign refined lead) continued to be minor. Of the 2,003 tons shipped 90 percent was destined for the United Kingdom and Brazil.

[1] In addition, 25,324 tons of foreign lead were reexported, according to American Bureau of Metal Statistics; official figures not available.

[2] In addition, 3,874 tons of foreign lead were reexported in 1942 and 11,258 tons in 1943, according to records of the Department of Commerce.

[3] United Kingdom of Great Britain and Northern Ireland.

WORLD ASPECTS OF THE LEAD INDUSTRY

Although considerable information is available for 1943 with respect to wartime developments in lead, these data are for the most part confined to countries in the Western Hemisphere. The continued dearth of pertinent information from many other important lead-producing centers makes any estimates of world production and consumption unwarranted. The last estimate by the Bureau of Mines indicated a world mine production of 1,635,000 metric tons in 1942, and it is doubtful if the output for 1943 was any greater, if as much. Increased Mexican output was insufficient to balance a lower production from both Canada and the United States, most South American countries showed a decline, and Australian production probably was less than in 1942. It is assumed that, under war conditions prevailing in Europe during 1943, production could not have advanced in those countries. In general, the lead position of the United Nations was relatively easy in 1943, and although consumption probably increased somewhat the total was roughly in balance with the supply.

World production of lead, 1938–43, in metric tons [1]

[1] By countries where smelted, but not necessarily refined.

[2] Data not yet available.

[3] Approximate production.

[4] Estimate included in total.

[5] Exclusive of secondary material (Metallgesellschaft, Frankfort on the Main).

[6] Includes small tonnage of lead contained in exported ore and concentrates. Separate figures not available.

[7] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.

REVIEW BY COUNTRIES

Argentina.—During 1943 the production of lead was generally limited to the amount necessary to meet Argentina's own needs—6,000 to 7,000 metric tons a quarter. The Metals Reserve Co. of the United States had no contract to buy lead concentrate, and none has been exported to the United States since January 1942. The Aguilar mine of the Compañía Minera Aguilar S. A., subsidiary of the St. Joseph Lead Co., continued to be the principal producer.

Australia.—No production figures have been published, but the 1943 output probably was somewhat below that of 1942. Mining activities were subject to critical labor shortages, which hit the production of lead and zinc. Until April 1943, Mount Isa Mines, Ltd., continued to produce lead bullion and zinc concentrate, but for the remainder of the year the output of these materials was curtailed in favor of copper production. On January 1, 1944, to balance the everchanging demands of war, the Australian Government requested that production again be concentrated on lead and zinc rather than on copper.

It is reported that an extensive underground exploratory campaign, coupled with diamond drilling by Lake George Mines, Ltd., at its property at Captain's Flat, New South Wales, has established an important lode. The ore, averaging 8 percent lead and 12 percent zinc, is concentrated by flotation.

Bolivia.—Mine production of lead in Bolivia decreased from 12,360 metric tons in 1942 to 11,387 tons in 1943. All ores and concentrates are exported, some going to Argentina for smelting and some to the United States. Exports in 1943 declined because of an increase in prices of mining materials, the difficulty of obtaining them, and the problem of transporting ores from the country. Despite the lessened incentive to produce, lead mining was encouraged in southern Bolivia, chiefly in Sud Chichos Province. Reportedly the Tito Hoyo mine—idle since 1931—was reestablished early in 1943, and production was increased at La Aviadora, La Salvadora, and La Rapida mines. The Matilde mine near Lake Titicaca, owned by Compañía Hochschild, was reported to contain 2,000,000 short tons of proved ore containing 24 percent lead, 20 percent zinc, and 1.6 ounces of silver per ton, as well as a trace of gold. The Huanchaca mine 13 miles northeast of Uyuni, the source of most of Bolivia's zinc output, is credited with about one-third of the lead production.

Brazil.—Little of interest regarding 1943 developments has been obtainable other than a report early in the year that a company was formed to exploit the lead deposits in Rio Grande do Sul. The program was sponsored by the State Government, which was to provide part of the necessary capital.

Canada.—Production of lead in Canada, including smelter production plus lead contained in exported ore, decreased from 256,071 short tons in 1942 to 222,177 tons in 1943. At least 95 percent of Canada's production of lead continues to come from the Sullivan mine of the Consolidated Mining & Smelting Co. which—according to the last available pre-war figures—contributed 11 percent of the world production. The company, which operates the only Canadian lead smelter and refinery at Trail, British Columbia, has long-term contracts with the British Government for about two-thirds of its refined-lead production at a relatively low price. Taxation throughout the year continued to be high, but despite this imposed burden plus the declining demand for lead late in 1943, new developments at smaller properties continued. The Aldermac Copper Corporation signed a contract late in the year for the sale of lead, zinc, and copper concentrates from its new mine near Sherbrooke, Quebec, to a United States smelter. It was reported that a 250-ton mill will be built and that the mine and mill equipment will be transferred from the old company property in the Noranda district. A new company, the Retallack Mines, Ltd., was organized to operate the Whitewater lead-zinc mine in the Slocan mining division. The disposal of the lead and zinc concentrates was reportedly arranged for through an agreement with the United States Commercial Co., a subsidiary of the Metals Reserve Co. In September the new mill of the New Calumet Mines, Ltd., started operating at the rate of 240 tons a day; the amount of ore was to be increased to reach the 500-ton-a-day rated capacity eventually. A Metals Reserve Co. contract for 70,000 tons of lead and zinc concentrates was negotiated.

Chile.—In June 1943, Chile's first lead smelter was completed and started operating. The plant, at Las Canas, 45 kilometers from Vallenar, is owned by the Sociedad Minera "Condorcaco."

Mexico.—Production of lead in Mexico has advanced steadily during the past 3 years; the output in 1943 amounted to 218,126 metric tons (lead content in ore) compared with 197,023 tons in 1942 and 155,259 tons in 1941. Mining was conducted under generally favorable conditions in 1943, with no serious labor troubles. The threatened industry-wide walk-out at the end of 1942 carried over into the early part of 1943 but was finally avoided. Operating companies agreed to advances in wages for workers, who also obtained additional benefits resulting from the Presidential decree of September 23, which provided for a general wage increase to labor. The so-called Bateman-Suarez agreement was renewed early in 1943 for another year, as the conditions of the agreement had proved mutually satisfactory and beneficial to both Mexico and the United States, which is the principal destination of Mexican exports. Unsatisfactory transportation facilities, both automotive and railroad, were one bad feature of the industry in 1943.

Newfoundland.—The mine production of lead, in terms of lead content of all concentrates produced, amounted to 32,940 short tons in 1943 compared with 28,007 tons in 1942. Nearly all exports of concentrates went to the United States, the remainder being destined for the United Kingdom.

Northern Rhodesia.—Northern Rhodesia is the leading producer of base metals in Africa from ore deposits containing lead, zinc, and vanadium in the Broken Hill and Lusaka districts. The Rhodesian Broken Hill Development Co., Ltd., reportedly was constructing a lead smelter in 1943 to recover the lead contained in large reserves of oxidized zinc ore, as well as a substantial tonnage of rich zinc-lead sulfide ore.

Peru.—The lead content of concentrates produced in Peru during 1943 was estimated to be 43,574 metric tons compared with 55,892 tons in 1942. This estimate is based upon reports of the major lead-producing companies. The largest part of the lead is derived from complex gold-silver-lead-zinc ores mined in the Department of Junin by the Cerro de Pasco Copper Corporation, Cia de Minas de Huaron, E. E. Fernandini, and Cia Minera Atacocha and in the Department of Puno by San Antonio de Esquilache. Minor producers operate in the Departments of Ancash, Huancavelica, and Lima. Although total production dropped in 1943, output did rise in the latter part of the year, and storage problems at some mines resulted. To alleviate this difficulty licenses were granted for shipping substantial amounts to other South American markets and Great Britain. Exports of metallic lead and lead in ore and concentrate amounted to 26,015 metric tons in 1943 (43,409 tons in 1942). According to the Over-All Metals Agreement of July 20, 1943 (effective until June 30, 1944), the price of lead was established at $0.04434 a pound of 40-percent lead concentrate or higher, f. o. b. steamer at Peruvian ports, less the usual smelting and treatment charges and deductions for metal losses and impurities. The Oroyo lead smelter recovered 43,171 metric tons of lead in 1943 (42,246 tons in 1942).

Spain.—The reported output of lead ore (concentrate?) in 1943 was 51,218 metric tons compared with 50,918 tons in 1942. The current Spanish production of lead metal has been estimated to be 34,000 metric tons a year; 21,000 tons are reserved for domestic market, and the remainder is available for export. To prevent an inflation of domestic lead prices, the Government has organized a new special service for lead (Servicio Sindical del Plomos) as a branch of the Vertical Syndicate of Metals (El Sindicato Vertical del Metal). The function of the service is to distribute among mines, smelters, and refineries the profits obtained from the sale of refined metal abroad at high prices.

Sweden.—According to plans formulated in 1943, the annual production from the Boliden Mining Co. property at Laisvall, Lapland, will be 50,000 metric tons of 13-percent lead ore. After milling, the concentrate will be shipped by truck and rail to the recently completed Rönnskär smelter, which has an annual capacity of 15,000 metric tons. This plant was originally intended for treating lead concentrate from mines in central Sweden also, but this product is reportedly now going to two new smelting works in central Sweden. Boliden's lead output will be limited to about 6,000 metric tons annually; the 1943 output reportedly was only a fraction of that amount. About 3,000 metric tons of lead concentrate are obtained annually from Kristineberg and Ravliden; all is exported.

U. S. S. R.—Little information has been obtainable from Russia during the past few years, but recent reports indicate that the lead industry was but slightly touched by the war, except for possible damage to the small Mizur lead mine in 1942. Total production in 1942 was planned to reach 100,000 tons, but there is no confirmation as to whether this goal was attained.

GENERAL SUMMARY

The ability of the zinc industry to continue to break the records established during the previous year was again demonstrated in 1943 for most phases; in fact, by now the upward gains can be almost termed commonplace. Continued Government regulatory measures helped an again-expanded smelting industry to increase the output to 5 percent above the 1942 record, even though operations were less than capacity, and to reach a level that may well be the all-time peak. Although production from domestic ore was lower than in 1942, this decline was more than offset by a substantial gain in output from foreign ore (another record), which also was sufficient to amply cover a drop in secondary redistilled-zinc production. Requirements were fully met, with enough excess to build up smelter stocks to a record high point. Some relaxation of conservation measures plus the increase in essential needs resulted in an over-all 12-percent gain in domestic consumption, yet consumers' stocks advanced 14 percent. Greater emphasis was placed on the use of high-purity metal than ever before; and the production of Special and Regular High Grades continued to increase, rather through a rise in output of electrolytic zinc than by redistillation of lower-grade zinc which decreased somewhat from 1942.

Domestic mine production was 3 percent less in 1943 despite the incentive of an enlarged premium-price plan. The lower output resulted from manpower shortages and depletion of ore reserves, largely in the Tri-State district.

---

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports. Some zinc ore is used directly in the manufacture of zinc pigments. (See chapter on Lead and Zinc Pigments and Zinc Salts.)

Total imports in 1943 again exceeded all previous records, the greater portion being in the form of zinc concentrate, largely from Mexico and Canada.

The established ceiling price of 8.25 cents a pound at St. Louis for Prime Western zinc was unchanged during 1942.

Salient statistics of the zinc industry in the United States, 1925–29 (average) and 1939–43

WAR AGENCY REGULATIONS

Throughout 1943 the zinc industry continued to operate under Government control. After all slab zinc production had been placed under allocation on June 1, 1942, according to General Preference Order M–11, amended, two added amendments were made in 1943. The first (on February 9, 1943) tightened the control on zinc by placing remelt zinc as well as refined metal under allocation. The second, on June 7, removed restrictions on deliveries of slab zinc to the Metals Reserve Co. Because of the shortage of zinc dust at the end of 1942, this material was placed under complete allocation on December 22, 1942, according to General Preference Order M–11–1. On March 23, 1943, an amendment indefinitely extended the original order, which otherwise would have expired March 31, 1943. Subsequent amendments on July 14 and December 15 were concerned with raising the maximum quantity of zinc dust that could be delivered without allocation order and extended the right of delivery (without allocation order) to dealers as well as producers. Since the original issuance on July 24, 1942, of Conservation Order M–11–b, which restricted the use of zinc in a large number of manufactured products and prohibited its use in others, many amendments have been made. All refer to gradual tightening and subsequent easing of restrictions on the use of zinc. Reference should be made to Conservation Order M–11–b, as issued by the War Production Board, for full details of the list of prohibited and permitted uses, as well as the exceptions permitted by General Limitation Order L–71.

Figure 1 shows trends in the zinc industry since 1900.

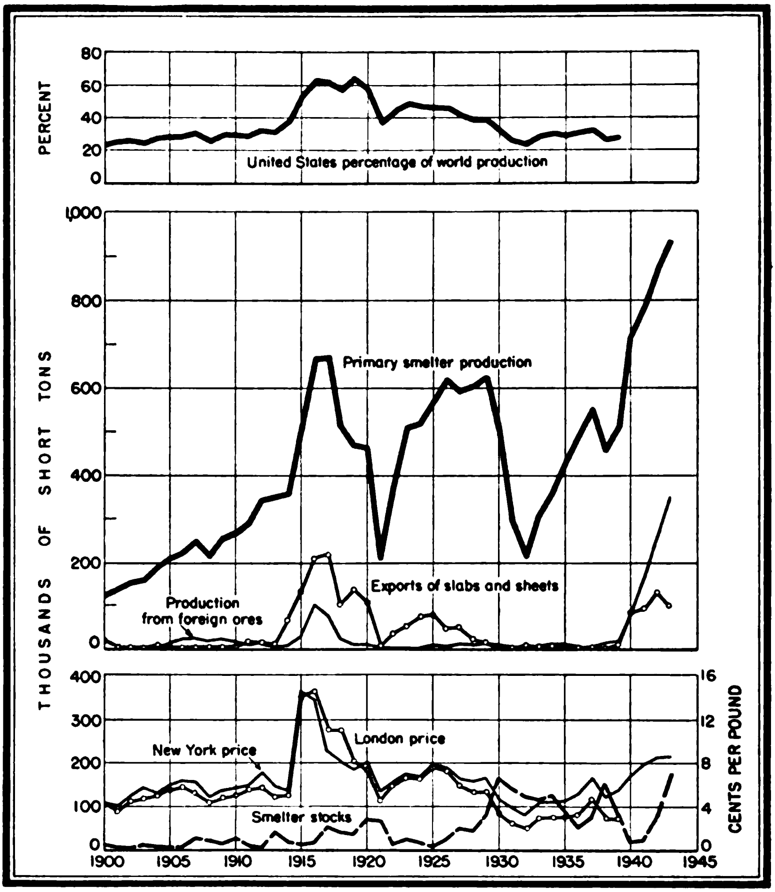

FIGURE 1.—Trends in the zinc industry in the United States, 1900–1943. Imports for consumption of slab and sheet zinc are not shown. Before 1936 they seldom exceeded 500 tons annually; but in recent years they have increased, amounting to 31,138 tons in 1939, 10,164 tons in 1940, 40,559 tons in 1941, 36,445 tons in 1942, and 56,155 tons in 1943.

The premium-price plan, whereby producers (miners) of zinc (copper and lead were also included in the plan) receive additional increments above the ceiling price for zinc (through Metals Reserve Co.) for overquota production, was maintained throughout 1943. On February 18, 1943, the scope of the Metals Reserve Co. plan was broadened to include a B and a C premium of 2.75 cents a pound each, in addition to the existing A premium of 2.75 cents. The effective time limit of the A premium was extended to July 31, 1945, with B and C premiums revokable at any time upon 30 days' notice. Under this revised plan the highest possible payment for excess production amounted to 16.5 cents a pound upon the basis of the ceiling price of 8.25 cents a pound, St. Louis, depending on the quotas assigned to the particular mine. In the Tri-State district a premium of $29.70 per ton for 60-percent concentrates was payable for overquota production for each of the assigned A, B, and C levels. This was equivalent to the 2.75-cent premium, allowing for metallurgical loss in treatment at the smelter. On October 27, 1943, the War Production Board issued a statement denying further premiums in the B and C range to zinc mines not already operating on the above date and to zinc mines having a low labor productivity and located in areas in which there is serious shortage of labor. The release also said that "* * * the Government is not now financing new zinc projects." On November 16 the above statement was clarified by the War Production Board, which explained that a mine was considered to be "already operating" on October 27 if a quota was assigned, the mine shipped metal (zinc in ore or concentrate), or expenditures for development, reconditioning, or on capital account were made on or before October 27 to bring the mine into production under the benefits of the quota plan.

SMELTING CAPACITY

Under the continued pressure of war requirements the record slab zinc production in 1943 reached a level that may be the wartime peak. The total output of 990,524 tons is somewhat short of early estimates, largely because the full capacity at smelters was not entirely utilized owing to manpower shortages that developed during 1943. Fortunately these difficulties affected output at only a few plants, and the potential tonnage of zinc lost was relatively small. According to reports to the Bureau of Mines, the zinc-producing plants in the United States on December 31, 1943, had a stated annual capacity to produce 1,091,000 tons of slab zinc under normal operating conditions. This figure, which allows for necessary shut-downs for repairs, indicates that the 1943 output was 91 percent of capacity. Using a similar comparison, primary smelters operated at 90 percent of a stated 709,000-ton capacity, electrolytic plants at 98 percent of a 338,000-ton capacity, and secondary smelters at 54 percent of a 44,000-ton capacity.

The expanded facilities for redistillation of the lower grades of zinc into high-grade metal were used to about two-thirds of capacity in 1943. The demand for the various grades generally took a more normal course toward the latter part of the year, and the need for high-grade zinc produced by redistillation declined to the point where there will probably be no necessity for this particular type of operation by the latter part of 1944.

No additional smelting capacity was under construction at the end of 1943, and only a small increase was planned at one smelter. Certainly the limit of wartime necessity has been reached, and the principal problem remains one of available supply of zinc concentrates.

SUPPLY OF ZINC CONCENTRATES

Despite the continued effort to stimulate domestic mine production of zinc by means of additional bonuses, output decreased 3 percent in 1943 owing to ore-reserve depletion in some districts—principally the Tri-State—and to acute labor shortages in others, and no major discoveries of ore were made under existing conditions. To alleviate some measure of the manpower shortage the Office of War Mobilization, on July 20, 1943, authorized the release of 4,500 men from the

Army to work in copper, zinc, and molybdenum mines of highest productivity. Of this total, approximately 1,080 (24 percent) were assigned to the zinc mines. This, of course, did help but not to any marked extent, and the drastic calling into the Army of all men under 26 years of age early in 1944 made the problem more critical than ever. Augmenting the supply of newly mined zinc in 1943, zinc was recovered from old tailings in increased amounts, from old and new lead blast-furnace slags from four slag-fuming plants (two in 1942), and from low-grade ores and plant residues by the use of an increasing number of Waelz-plant installations.

Dependence on imports of foreign ore and concentrate in 1943 was greater than ever before. Such imports reached an all-time high of 536,988 tons of zinc (content) in 1943. The rapid rise in relative amounts of foreign and domestic ore used in producing slab zinc is strikingly demonstrated by comparing the 37 percent produced from foreign ore in 1943 with the 29 percent in 1942, 21 percent in 1941, 13 percent in 1940, and only 3 percent in 1939. This does not include a substantial tonnage consumed in the manufacture of zinc pigments. The foreign supply, principally from the Western Hemisphere, comes largely from Mexico and Canada and fortunately is rail-borne. Imports from these two countries should be maintained in 1944; but imports from Australia and Argentina—which showed marked increases in 1943—probably will be lower in 1944, inasmuch as the greater part of the total from these sources came from stock-piled material now largely depleted.

All indications point to a somewhat lower over-all new supply of concentrates in 1944, both from foreign and domestic sources, sufficient to meet requirements, but with not much margin for a surplus.

POST-WAR OUTLOOK

The position of the United States has been preeminent in the zinc industry of the world over a period of many years, owing to vast resources of relatively low-grade ore. This wealth of raw material, made available largely by creating a domestic price based upon a tariff, more than supplied domestic demands in this country until the middle 1930's. Production from our mines was adequate to supply an exportable surplus, and foreign zinc was relatively unimportant to our national economy. The advent of the Second World War late in 1939 precipitated heavy demands for zinc which could not be met by domestic mine production, and imports of zinc increased rapidly. The 1942–43 rate of mine production cannot long be maintained, particularly if premium prices should be withdrawn, and it seems certain that the post-war level of domestic mining will be lower, perhaps in the range of 400,000 to 600,000 tons a year. The pent-up consumer demand to be filled in the post-war years in all probability will result in an annual minimum consumption for some years of 550,000 to 750,000 tons of slab zinc and an additional 100,000 tons more from ore used in pigments and chemicals, not including the amount needed for possible Government stock piles under consideration. These data, based upon past statistical records and current estimates of the various zinc consumers, indicate a deficit in domestic supply—including available zinc from scrap—that perforce must be made up by continued imports. The answers to the questions of future Government control, prices, and tariff cannot be foretold. It is possible that there will be limited control to bridge the gap of industrial reconversion from a war- to a peace-time economy and probable that the price of zinc will become lower; moreover, indications point to a downward trend in tariff. The domestic mines conceivably could fill the demand for new zinc for a limited time, given adequate price and tariff protection, but ore reserves have been drawn upon heavily during the war period, and it is doubtful if domestic mines will again completely and continually fulfill the zinc needs of this country, even though zinc will be mined for many years to come.

DOMESTIC PRODUCTION

PRODUCTION OF PRIMARY AND REDISTILLED SECONDARY SLAB ZINC

The production of primary slab zinc broke all records in 1943, and the 942,309-ton output exceeded the previous high point of 1942 by 6 percent. The use of foreign ore continued to reach new highs, the total zinc made from this source increasing 33 percent over 1942 as against a decrease of 6 percent in the amount of zinc produced from domestic ore.

Continued calls for a lessened supply of zinc scrap again reduced the production of redistilled slab zinc, which was 9 percent below 1942 and lower than in any year since 1938. Figures for the output of remelted secondary slab zinc are not included with those for redistilled metal. In 1943 the production of such slab zinc recovered by remelting purchased scrap amounted to 7,406 tons (10,389 tons in 1942). Zinc rolling mills and other consumers recover much more than this from their own plant scrap, but such metal normally does not enter the market as scrap and is, therefore, not measured statistically.

Primary and redistilled secondary slab zinc produced in the United States, 1939–43, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	Domestic	Foreign [1]	Total		
1939	491.058	16,178	507,236	50,428	557.664
1940	589.988	85,287	675,275	48,917	724.192
1941	652,599	169,421	822.020	59,503	881,523
1942	629,957	[2] 261,915	891,872	53.195	945,067
1943	594,250	[2] 348,059	942,309	48,215	990,524

[1] Most of the foreign ores smelted in the United States in 1939 originated in Mexico, Peru, and Argentina; in 1940–41, principally in Mexico, Canada, Newfoundland, and Peru; in 1942, in Mexico, Canada, Argentina, Newfoundland, Australia, and Peru; and in 1943, in Canada, Mexico, and Australia.

[2] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

DISTILLED AND ELECTROLYTIC ZINC

Of the primary zinc produced in 1943, 65 percent was distilled and 35 percent electrolytic compared with 72 and 28 percent in 1942.

The continuing increase in the demand for wrought-brass products for military uses again underlined in 1943 the importance of high-grade slab zinc. Although the available capacity for redistilling Selected and Prime Western zinc into high-grade zinc was not fully utilized, the increased capacity for producing electrolytic high-grade zinc was used nearly 100 percent, with the result that the record primary electrolytic zinc output in 1943 was 30 percent above 1942 and more than sufficient to balance a 4-percent decrease in production of distilled primary zinc. Production of Special High Grade gained 27 percent and Regular (ordinary) High Grade 21 percent in contrast with Selected and Prime Western production, which was 24 and 16 percent lower, respectively. Of course the original first-stage smelter production of these two lower grades of zinc was somewhat higher than is indicated in the following table; but to avoid duplication, the quantity of each grade consumed in the redistilling operation was discounted. The resultant Special and Regular High-Grade slab zinc produced is included. It is believed that the data shown thus give a more accurate picture of the quantity and grades of zinc actually made available for use. Of the total 1943 production (comparable 1942 figures in parentheses), 31 percent (27 percent) was Regular High Grade, 30 percent (24 percent) Special High Grade, 23 percent (29 percent) Prime Western, 8 percent (9 percent) Brass Special, 6 percent (8 percent) Intermediate, and 2 percent (3 percent) Selected.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1939–43, in short tons

APPORTIONED ACCORDING TO METHOD OF REDUCTION

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

PRODUCTION OF PRIMARY SLAB ZINC BY STATES

Montana was the leading producer of primary slab zinc in 1943 and took the position held by Pennsylvania since 1934, when it in turn displaced Montana for first place. Illinois ranked second, closely followed by Pennsylvania. Of the States for which production figures may be released, Oklahoma, Idaho, and Arkansas occupied the next three positions, in order of decreasing importance. Pennsylvania, Oklahoma, and Arkansas had less production than in 1942, and Illinois continued to be the leader in rate of increase—26 percent in 1943 (44 percent in 1942). Montana and Idaho, as usual, produced electrolytic zinc only, Illinois and Texas made both electrolytic and distilled metal, and all other States confined their operations to distillation alone. One new State—Missouri—was added to the roster with the experimental production of slab zinc directly from the treatment of lead-smelter slag by the fuming process.

Primary slab zinc produced in the United States, by States where smelted, 1939–43, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Other States[1]	Total

[1] Texas and West Virginia; also Missouri in 1943.

SECONDARY ZINC

In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab zinc is produced, and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the chapter on Secondary Metals—Nonferrous.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from the sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of sulfur. The production of sulfuric acid at zinc-blende roasting plants showed a strong gain of 19 percent in 1943.

Sulfuric acid (60° B. basis) made at zinc-blende roasting plants in the United States, 1939–43

Year	Made from zinc blende[1]		Made from sulfur		Total[1]		
						Value[2]	
	Short tons	Value[2]	Short tons	Value[2]	Short tons	Total	Average per ton

[1] Includes acid from foreign blende.

[2] At average of sales of 60° acid.

ZINC DUST

The production of 25,990 short tons of zinc dust in 1943 broke all previous records; it was 6 percent above the former high point reached in 1941 and 14 percent over the 1942 output. The zinc content of the dust ranged from 95.0 to 99.6 percent and averaged 97.5 percent. Shipments of zinc dust in 1943 totaled 25,552 tons, of which 3,429 tons or 13 percent went to foreign countries (according to data submitted to the Bureau of Mines). This figure is possibly somewhat low, as Government purchases (of which at least a considerable portion was eventually shipped abroad) were not given separately, and a part of this quantity no doubt was included under domestic shipments. By far the largest group use of zinc dust is in chemical manufacturing, with sodium hydrosulfite the principal single item. According to data compiled by the Zinc Division of the War Production Board, 20,830 tons of zinc dust were used in 1943, of which 10,415 tons (50 percent) went into the making of sodium hydrosulfite. Production and shipments of zinc dust in 1943 were about in balance, and producers' stocks showed only a moderate increase from 1,259 tons at the beginning to 1,421 tons at the close of the year. The average price of zinc dust shipped to domestic consumers in 1943 was 10.1 cents per pound compared with 10.4 cents in 1942. The raw materials used to manufacture zinc dust are reviewed in the chapter on Secondary Metals—Nonferrous. More than three-fourths of it is produced from zinc scrap, principally galvanizers' dross, and the remainder is made from zinc ore, slab zinc, and as a byproduct of zinc refining.

Zinc dust[1] *produced in the United States, 1939–43*

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1939	16,835	$2,367,861	$0.070	1942	22,805	$4,789,050	$0.105
1940	20,731	3,404,970	.082	1943	25,990	5,170,647	.101
1941	24,429	4,641,580	.095				

[1] All produced by distillation.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinciferous materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

MINE PRODUCTION

Mine production of recoverable zinc (including that made into zinc pigments) in the United States decreased 3 percent in 1943. Increases in output from 13 of the 21 zinc-producing States were insufficient to balance a drop from the other 8 States. The general over-all decline in production was due to several reasons, including exhaustion of developed ore reserves, manpower shortages, and inefficiency of the too few replacements available.

Zinc mining operations are largely centered in five localities—the Tri-State area of Kansas, Southwestern Missouri, and Oklahoma; Tennessee-Virginia; Essex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, New Mexico, Utah, Colorado, and Montana). The Western States output advanced 12,221 tons or 4 percent, the Central States decreased 35,474 tons (14 percent), and the Eastern States total remained virtually unchanged. The Tri-State area (Joplin region), maintained its position as the principal zinc-producing district, with 27 percent of the total United States output even though production decreased 37,422 tons in 1943. To some extent this drop was due to severe floods in May which caused the temporary shut-down of many mines in that area but largely was because of a continuing depletion of high- and medium-grade ore reserves. Oklahoma continued to be the principal producer in the country, contributing half the yield from the Central States, but the gap between Oklahoma and New Jersey (the leading producer in the Eastern States and the second in the country) was narrowed considerably.

All Western States except Idaho, Montana, South Dakota, and Washington gained in production during 1943 and together supplied 43 percent of the domestic total. Idaho again was the largest producer in this region despite a minor decline of less than 1 percent. A large increase from the new Bunker Hill slag-fuming plant was insufficient to out-weigh declines from other large properties, including

Mine production of recoverable zinc in the United States, 1925–29 (average) and 1939–43, by States, in short tons

the Hecla. Second place went to New Mexico in 1943 owing to a marked increase of 28 percent in output, which came principally from the Central district. Utah was third, followed closely by Colorado, with a 37-percent increase over 1942 and the largest output of any year since 1918. Montana's 31-percent decrease was due to a lower production of zinc-lead ores from the Butte district. Additional data on mine production of zinc are given in the separate chapters covering each State.

Mine production of recoverable zinc in the United States, by districts that produced 1,000 tons or more during any year, 1939–43, in short tons

STOCKS

PRODUCERS' STOCKS

An outstanding feature of the zinc industry in 1943 was the all-time high record producers' stock total attained by the end of the year—102 percent above the quantity on hand at the beginning. However, of this physical inventory at the plants, only 22 percent was company-owned, the remainder being held for the account of the Metals Reserve Co. All of the gain was at the primary reduction plants, as stocks at secondary distilling plants, although comparatively small, declined 6 percent. Of the total stocks on hand at the end of the year, 106,588 tons were Special and Regular High Grade and Intermediate and the remainder (64,037 tons) were of lower grades, compared with 17,917 tons and 66,523 tons, respectively, at the end of 1942. Nearly the entire inventory gain can be accounted for by the accumulation of the two highest grades, and the total represents better than 2 months' requirements upon the basis of smelter shipments in 1943.

According to the American Zinc Institute, stocks of slab zinc followed a constant upward trend throughout 1943.

Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1939–43, in short tons

	1939	1940	1941	1942 [1]	1943
At primary reduction plants	83,728	19,212	24,212	82,498	168,790
At secondary distilling plants	2,555	761	890	1,942	1,835
	86,283	19,973	25,102	84,440	170,625

[1] Revised.

Stocks of zinc ore (60 percent concentrates) in the Tri-State district (as reported by the Tri-State Zinc and Lead Ore Producers' Association) on January 2, 1943, were only 957 tons, the lowest point reached in 1943, but rose sharply to 3,535 tons by January 9 and then to 3,989 tons by January 16, followed by a gradual decline to 2,621 tons on February 6. With the exception of the end of April this general cyclic trend of rising stocks during the month, followed by a drop in inventory at or near the end of the period, continued throughout the year. This trend, first noticed during the last three quarters of 1942, is apparently the result of the premium-price plan, which encourages the practice of making heavy shipments at the end of the month, with a consequent drop in inventories. In general, the trend in stocks was upward during the year, the high point of 6,952 tons being reached on December 25. This was followed by a decrease to 5,315 tons on January 1, 1944.

According to an American Zinc Institute survey, total stocks of domestic and foreign zinc ore and concentrates at primary reduction plants on December 31, 1943, totaled 673,247 tons averaging 54 percent zinc compared with 540,339 tons containing 55 percent zinc at the end of 1942. The Bureau of Mines in 1943 asked for comprehensive data covering all raw material used at zinc-processing plants. This information, received for the first time, was submitted too late to be included here, but is to be used as the basis for a release to be published at an early date.

CONSUMERS' STOCKS

Stocks of slab zinc at consumers' plants continued to advance in 1943, and the total on December 31 showed a net gain of 14 percent above the quantity at the beginning of the year. Inventories increased steadily from the first of the year until June 30, when the maximum of 87,100 tons was reached; this was followed by a decline to 74,000 tons by October 30. Both galvanizers and manufacturers of brass products showed increases in stocks; the former advanced 13 percent, the latter exhibited a marked gain of 29 percent. Because of variance in coverage and certain changes in industrial classification, all figures on stocks for December 31, 1942, that appeared in the 1942 chapter were revised. The largest change—in the brass-mill group—was upward and reflects the addition of several new brass mills that were not covered in 1942. At the average monthly rate of consumption in 1943, consumers' stocks on hand at the end of 1943 were adequate for about 1¼ months' requirements.

In addition to physical stocks on hand at consumers' plants at the end of 1943, 16,500 tons of zinc were in transit to consumers, held for redistillation, and in dealers' hands. Exclusive of an indeterminate quantity in bonded warehouses, the approximate total slab zince in stock (including inventories at producers' plants) on December 31, 1943, amounted to 273,000 tons. The comparative figure at the end of 1942 was 181,000 tons (revised).

Consumers' stocks of slab zinc at plants at the beginning and end of 1943, by industries in short tons

	Galvanizers	Die casters [1]	Brass mills [2]	Zinc rolling mills	Oxide plants	Others	Total

DOMESTIC CONSUMPTION

NEW SUPPLY

The following table shows the 5-year trend of primary slab zinc available for consumption in the United States. This calculated quantity, in effect, is equivalent to the slab zinc apparently made available each year for shipment to domestic consumers during the year.

In addition to primary zinc, 48,322 tons of redistilled secondary metal were made available to consumers in 1943 after allowance for a slight decrease in stocks at secondary smelters.

Primary slab zinc available for consumption in the United States, 1939–43, in short tons

	1939	1940	1941	1942	1943

[1] General imports.
[2] Adjusted to exclude imported slab zinc further refined into high-grade metal in the United States.

CONSUMPTION

According to reports from 650 plants, representing an estimated 97 percent of the consuming industry in the United States, 816,777 tons of slab zinc were put in process in 1943, a 12-percent increase from the 1942 total of 728,169 tons. Receipts for this same period were 827,504 tons. The apparent discrepancy between this figure and the calculated 854,574 tons of primary and secondary slab zinc shipped to domestic consumers in 1943 can be attributed largely to incomplete coverage of the survey, although variations in metal in transit and unaccounted-for slab zinc stored in bonded warehouses certainly are factors to be considered.

The influence of continued Government control is indicated by certain comparisons of the 1943 data with those for 1942. The manufacture of brass products—an increasing "must" in the category of essential requirements—consumed 31 percent more zinc than in 1942. The limited relaxation in the control of zinc used in galvanized products was reflected in a 2-percent gain for the galvanizing group. The

[1] Based on a canvass of 600 plants in 1941 and 1942 and a somewhat larger coverage in 1943, mostly from small consumers.
[2] Includes zinc used in electrogalvanizing, but excludes sherardizing.
[3] Separate figures not available but included in the total.
[4] Includes miscellaneous articles not elsewhere mentioned.
[5] Included under "Other uses" in 1941 and 1942.
[6] Included under "Zinc-base alloy."
[7] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals, castings, and miscellaneous uses not elsewhere mentioned.

manufacture of zinc-base alloy declined moderately, and rolled-zinc ouput was less. On the other hand, the need for increased quantities of French-process zinc oxide for military uses resulted in the allocation of more zinc for this purpose; consumption advanced markedly. Details are shown in the preceding table, which gives a more comprehensive use division in 1943 than has been available heretofore.

Although the consumption of zinc for galvanizing sheet and strip declined slightly, the quantity used for this purpose was only 29 percent of the total employed in all galvanizing as compared with 31 percent in 1942 and 37 percent in 1941. The use of zinc in tubes and pipe, and wire and wire rope, increased in 1943, and zinc used in coating fittings and shapes ("other") was 13 percent more and comprised 37 percent of the total as against 33 percent in 1942. Separate data on wire cloth were not obtained in 1943, and the zinc used in fittings was not reported in previous years, being included in the "other" group.

Brass mills, foundries, and ingot makers consumed 51 percent of the total zinc used compared with 44 percent in 1942 and almost doubled the 1941 ratio. No direct comparison of the detailed brass-products divisions can be made, but the largest gain probably was in sheet, strip, and plate for use in making cartridges and shell cases. Production at several small arms plants was cut back late in 1943, but the resulting decrease in zinc consumption was minor compared with the enormous comparative total used at all such plants.

The use of zinc for die castings gained slightly in 1943, whereas zinc for alloy dies and rod was less. This does not mean that the use of stamping dies (the principal product in this category) was less, but rather that the saturation point—resulting from the expanded aircraft program—had been reached and that less new zinc was needed. A particular advantage of these zinc-base alloy dies is the ease with which they can be remelted and re-formed for use again.

The necessity of utilizing slab zinc in even greater quantities for more essential needs than rolled zinc resulted in a marked reduction (27 percent) in the consumption of zinc for this purpose. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1943 amounted to 12,809 tons—an 18-percent drop from 1942. Only 811 tons of purchased zinc scrap in the form of zinc clippings, old zinc scrap, and engravers' plates were melted and rolled in 1943 (2,023 tons in 1942). The zinc lost in waste products such as skimmings and ashes totaled 1,194 tons in 1943, equivalent to 2.4 percent of the net production of rolled zinc. Production of rolled zinc from these raw materials (including 37 tons of purchased remelt spelter) amounted to 48,126 tons—a decrease of 28 percent from 1942. The total value of the rolled products was 29 percent less than in 1942; but the decrease was proportional to the lowered output, and the average price of $0.120 remained virtually unchanged from $0.122 in 1942. Inventories of rolled zinc were 1,361 tons on December 31, 1943, compared with 1,627 tons (revised) on the same date in 1942. In addition to the actual shipments of 32,875 tons of rolled zinc in 1943, the rolling mills consumed 28,326 tons of rolled zinc (including that which was remelted and rerolled) in the manufacture of 15,517 tons of fabricated products..

[1] Figures represent net production. In addition, 15,641 tons of strip and ribbon zinc in 1942 and 12,809 tons in 1943 were rerolled from scrap originating in fabricating plants operated in connection with zinc rolling mills.

[2] Less than 1 ton.

[3] Allowances made for change in producers' stocks of rolled zinc.

The following table shows the six commercial grades of refined slab zinc consumed by the various industries in 1943. Of the 816,777 tons of domestic and foreign zinc consumed, 31 percent was Prime Western, 29 percent Special High Grade, and 27 percent Regular High Grade. Prime Western was the principal grade used by galvanizers in the hot-dip process, the high grades—largely in the form of anodes—being used for the most part for electrogalvanizing. Although all grades were used in making brass products, the need for high-purity metal for lead-free cartidge brass has resulted in 87 percent of the slab zinc used being of the three highest grades. Zinc used for zinc-base alloy products was limited almost entirely to Special and Regular High Grade because of rigid specification requirements, as was also the case with zinc oxide.

Consumption of slab zinc in the United States in 1943, by grades, according to industry, in short tons

	Special High Grade	Regular High Grade	Intermediate	Brass Special	Selected	Prime Western	Total

Total	234,962	218,609	49,678	53,318	8,842	251,368	816,777

PRICES

The base ceiling price of 8.25 cents a pound for Prime Western at St. Louis and $55.28 per ton of 60-percent zinc concentrates at Joplin remained unchanged throughout the year. For comparison it is interesting to note that the average price received by the primary producers for all grades of zinc sold in 1943 was 8.6 cents a pound, f. o. b. plants (8.7 cents in 1942). The 1943 price of 10.8 cents for zinc, which appears in the separate State chapters, represents the above weighted average price received for slab zinc plus the increment—in terms of cents per pound based upon the total recoverable zinc output—of $33,300,000 in overquota A, B, and C premiums paid by the Metals Reserve Co. The premium-price plan is briefly outlined in this chapter under the heading, War Agency Regulations.

The official London maximum price of £25 15s. for foreign zinc delivered to consumers, duty paid, and £26 10s. for domestic metal remained unchanged throughout 1943.

[1] American Metal Market quotes average prices of High Grade and Brass Special as follows: High Grade (f. o. b. New York)—1939, 6.16 cents; 1940, 7.38 cents; 1941, 8.48 cents; 1942, 9.25 cents; 1943, 9.25 cents. Brass Special (f. o. b. East St. Louis)—1939, 5.22 cents; 1940, 6.44 cents; 1941, 7.68 cents; 1942, 8.50 cents; 1943, 8.50 cents.

[2] Does not include overquota premium payments made by Metals Reserve Co.

ZINC-REDUCTION PLANTS

ZINC SMELTERS

There was no change in the number of zinc smelters in 1943. For the past 3 years there have been 17 active plants, of which 13 operated with horizontal retorts exclusively, 1 with both horizontal and vertical retorts, 2 with large vertical retorts, and 1 with electrothermic furnaces. The total number of retorts reported at the horizontal-retort primary plants was 72,712, an increase of 7 percent over the 67,816 at these plants on December 31, 1942. The gain was the result of completion during 1943 of 4,896 retorts under construction at the end of 1942. Of the total retorts reported, 68,232 were in use at the close of 1943—a gain of 4 percent over the 65,508 in operation at the end of 1941. That this gain did not parallel the increase in new capacity was due largely to shortage of adequate manpower, which necessitated the closing several blocks of retorts at some plants, and only 94 percent of the total available was in operation at the end of 1943. Of the 66 vertical retorts in the United States, 64 were in operation at the close of the year.

Nine primary plants in 1943 (12 in 1942) produced zinc from zinc scrap and residues such as zinc skimmings and dross which were distilled in the same retorts as the sintered concentrate. In addition to the 17 primary producers, 11 plants (15 in 1942) produced redistilled secondary slab zinc by treating scrap zinc and other secondary zinciferous materials in clay retorts, graphite crucibles, and two special furnace installations. These 11 plants reported a total of 2,456 retorts and 105 crucibles on December 31, 1943, of which 1,180 retorts and 41 crucibles were in operation. Part of this available production capacity at secondary smelters was used to produce zinc dust and zinc oxide in addition to slab zinc.

During the latter part of 1943 the St. Joseph Lead Co. operated its new slag-fuming plant at Herculaneum, Mo., and experimentally recovered a small tonnage of slab zinc as a direct product of the operation, which treats lead-smelter slags containing some zinc. This plant is unique in that it is the only one of the four slag-fuming plants in the country that has produced metal directly, the usual product being an impure zinc oxide generally shipped to a zinc smelter for reduction to metal.

ELECTROLYTIC PLANTS

Five electrolytic plants were in operation during 1943, the same as in 1942; all produced at, or close to, capacity throughout the year. There were 3,204 cells at the plants on December 31, 1943, out of which total 3,128 (98 percent) were in operation. No new installations were reported under construction or planned.

FOREIGN TRADE[2]

IMPORTS

The following tables give total zinc imports (general) in ore and blocks, pigs, or slabs into the United States, 1941–43, and imports for consumption. Of the 536,988 tons of zinc imported in ore, 31 percent came from Mexico, 22 percent from Australia, and 21 percent from Canada. Receipts from Australia were almost three times larger than in 1942, and Canada supplied 33 percent more in 1943. All countries except Peru increased their shipments to the United States. Substantially all imports credited to Chile are from Bolivia and were shipped from Chilean ports. Imports of slab zinc from Canada were two and a half times that in 1942, and receipts from Mexico increased 33 percent.

Zinc imported into the United States in ore, blocks, pigs, or slabs, 1941–43, by countries, in short tons[1]

Country	1941	1942	1943
Ore (zinc content):			
Argentina	20, 579	23, 395	53, 452
Australia	8, 933	32, 212	120, 244
Belgian Congo	12, 563	2, 873	14, 835

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

EXPORTS

The value of exports of zinc ore and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $19,322,462 in 1943 compared with $24,536,793 in 1942. Slabs, plates, or blocks continued to be the largest export group, but the total shipped to foreign countries decreased 27 percent—from 133,938 tons in 1942 to 97,439 tons in 1943. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in this volume in the chapter on Lead and Zinc Pigments and Zinc Salts. Much of the zinc used in the manufacture of such products is of foreign origin, and when they are exported a draw-back of 99 percent of the import duty is paid upon the basis of zinc contained in the finished product. Data covering 1943 draw-back were not available at the time of writing (June 24, 1944). Totals for preceding years were: 1942, 23,047 tons; 1941, 34,478 tons; 1940, 19,306 tons, and 1939, 16,216 tons.

WORLD ASPECTS OF THE ZINC INDUSTRY

Although considerable information is available in 1943 with respect to wartime developments in zinc, for the most part these data are confined to countries in the Western Hemisphere. The continued dearth of pertinent information from many other important zinc-producing centers makes any estimates of world production and consumption unwarranted. The last estimate by the Bureau of Mines indicated a world mine production of 2,044,000 short tons (recoverable zinc content) in 1942, and it is doubtful if the output for 1943 was any greater, if as much. The total production from the United States, Canada, and Mexico, which represents more than half of the world output, was less in 1943 than in 1942. Canadian and Mexican gains were insufficient to offset a decline in production from the United States. Total production from South America—largely from Argentina, Bolivia, and Peru—remained much the same, but Australian production probably was less than in 1942. Under war conditions prevailing in Europe during 1943, it is assumed that output could hardly have increased in those countries. The zinc position of the United Nations was easy in 1943, and over-all production probably was greater than consumption.

World smelter production of zinc, 1938–43, by countries where smelted, in metric tons [1]

[2] Estimate.

[3] Data not available.

[4] Includes 3,670 tons of electrolytic zinc in 1938. Data not available for later years. Production of electrolytic zinc began in August 1935.

[5] Included with Germany.

[6] Some secondary metal included.

[7] Includes Czechoslovakia.

[8] Estimate included in total.

[9] January to June, inclusive.

[10] January to August, inclusive.

REVIEW BY COUNTRIES

Argentina.—Mine production of zinc concentrate in 1943 was 37,185 metric tons, a decrease of 32 percent from the 54,642-ton output in 1942. The concentrate, nearly all of which is from the Aguilar mine, generally averages about 54 percent zinc. Of the substantial stock of concentrate on hand at the mine at the end of 1942, the greater part, if not all, was shipped to the United States during 1943.

Australia.—No figures have been published regarding Australian production, but mining activities were subject to critical labor shortages which hit the output of zinc and lead. Until April 1943 Mount Isa Mines, Ltd., continued to produce zinc concentrate and lead bullion, but for the remainder of the year output of these materials was curtailed in favor of copper production. On January 1, 1944, to balance the ever-changing demands of war, the Australian Government requested that production again be concentrated on zinc and lead rather than copper.

An extensive underground exploratory campaign by Lake George Mines, Ltd., at its property at Captain's Flat, New South Wales, reportedly has established an important lode. The ore, averaging 12 percent zinc and 8 percent lead, is concentrated by flotation.

The Electrolytic Zinc Co. of Australia reported a fairly even rate of production, although temporary reductions in output occurred due to interruptions in transporting zinc concentrate from the mainland. The lack of experienced labor slowed operations at the Tasmanian West Coast mines, and lack of materials set back the planned expansion of the electrolytic plant.

Bolivia.—Bolivia has become increasingly important as a zinc-producing country. Mine production of zinc in 1943 was 21,074 metric tons (zinc content in ore) compared with 10,909 tons in 1942, mostly from the Huanchaca mine. The Matilde mine near Lake Titicaca, owned and operated by the Compañía Hochschild, has been prospected and developed and reportedly contains an estimated 2,000,000 short tons of proved ore averaging 20 percent zinc, 24 percent lead, 1.6 ounces of silver per ton, and a trace of gold.

Brazil.—Little information is obtainable on the zinc industry of Brazil. A small production of electrolytic zinc was made in 1942 and 1943 by Companhia Brasileira do Zinco at a comparatively new plant at Utinga, near São Paulo, which has a reported capacity of 2 tons a day. The plant, which is expected to double its capacity, uses Bolivian ore.

Canada.—Production of zinc in Canada in 1943, including smelter production plus zinc contained in exported ore, amounted to 304,284 short tons (preliminary official figure), a gain of 5 percent above the 290,129-ton output in 1942. Of the total mine production, 55 percent was from British Columbia (mostly from the Sullivan mine), and the balance came largely from Quebec (21 percent), Saskatchewan (16 percent), and Manitoba (7 percent). Refined zinc production amounted to 206,510 tons (215,800 tons in 1942) from two electrolytic plants, one at Trail, British Columbia, operated by the Consolidated Mining & Smelting Co., Ltd., the other at Flin Flon, Manitoba, operated by the Hudson Bay Mining & Smelting Co., Ltd. Taxation continued to be high throughout the year, but despite this imposed burden new developments continued. The Aldermac Copper Corporation signed a contract late in 1943 for the sale of zinc, lead, and copper concentrates from its new mine near Sherbrooke, Quebec, to a United States smelter. It was reported that a 250-ton mill will be built, the mine and mill equipment to be transferred from the old company property in the Noranda district. A new company, the

Retallack Mines, Ltd., was organized to operate the Whitewater zinc-lead mine in the Slocan mining division. The disposal of the zinc (and lead) concentrates was reportedly arranged for through an agreement with the United States Commercial Co., a subsidiary of the Metals Reserve Co. In September the new mill of the New Calumet Mines, Ltd., started operating at the rate of 240 tons a day; the amount of ore is being increased to reach eventually the 500-ton per-day rated capacity. A Metals Reserve Co. contract for 70,000 tons of zinc and lead concentrates was negotiated.

Mexico.—Production of zinc in Mexico continued to advance in 1943, total production, in terms of zinc in ore plus smelter output, amounting to 197,199 metric tons compared with 189,278 tons in 1942 and 154,996 tons in 1941. Mining operations were conducted under generally favorable conditions, with no serious labor troubles in 1943. The threatened industry-wide walk-out at the end of 1942 carried over into the early part of 1943 but was finally avoided. Operating companies agreed to advances in wages for workers, who also obtained additional benefits resulting from the Presidential decree of September 23 which provided for a general wage increase to labor. The so-called Bateman-Suarez agreement was renewed early in 1943 for another year, the conditions of the agreement having proved mutually satisfactory and beneficial to both Mexico and the United States, which is the principal destination of Mexican exports. Unsatisfactory transportation facilities, both automotive and railroad, were one bad feature of the industry in 1943.

Newfoundland.—Mine production of zinc in 1943 amounted to 66,418 short tons (zinc content) compared with 56,202 tons in 1942. This 1943 tonnage was from 108,642 tons of 53-percent zinc concentrate (94,114 tons in 1942) and includes 8,874 tons of zinc contained in lead and copper concentrates (6,564 tons in 1943).

Northern Rhodesia.—Northern Rhodesia is the leading African producer of base metals, which come from ore deposits containing zinc, lead, and vanadium in the Broken Hill and Lusaka districts. The Rhodesian Broken Hill Development Co., Ltd., which operates the most important zinc mine in Africa, is reportedly installing a new mill and roasters to treat a substantial tonnage of rich zinc-lead sulfide ore recently developed. Mining has been largely confined to extensive reserves of oxidized zinc ore.

Peru.—Upon the basis of reports of the major zinc-producing companies, it has been estimated that 54,650 metric tons of concentrate containing 32,450 tons of zinc were produced in 1943 compared with 56,663 tons of concentrate containing 29,231 tons of zinc in 1942. The largest part of the zinc is derived from complex gold-silver-zinc-lead ore mined in the Department of Junin by the Cerro de Pasco Copper Corporation. That production by this company increased in 1943 was due in part to completion of the 800-ton daily capacity zinc concentrator. The electrolytic zinc pilot plant at Cerro de Pasco, which began production in 1940, reached the maximum annual capacity output of 1,200 metric tons of zinc by the end of 1943. Difficulties in obtaining supplies and power necessitated postponing the construction of the planned large-scale commercial electrolytic plant.

Among other factors influencing increased zinc production in 1943 were the construction of a 150-ton daily capacity zinc concentrator at

Cia Minera Atacocha, S. A., for the treatment of an estimated 100,000 tons of 14-percent zinc tailings and the beginning of zinc production in July at Cia Minera Yauli from a 100-ton daily capacity flotation plant. An agreement was signed on April 3, 1943, between the Volcan Mines Co. and Cerro de Pasco for the treatment of zinc ores from Volcan at the Mahr and Casapalca mills of Cerro de Pasco at an estimated rate of 300 short tons a day. Shipments of Volcan ore to the Mahr mill started in January 1944. Construction of a 500-ton-per-day concentrator at the Volcan mine—planned in 1943—was temporarily shelved. Installation of mining equipment was 50 percent complete at the close of 1943, but mine production is to increase in 1944 to at least 300 tons of ore a day.

Spain.—Output of zinc ore (concentrate?) in 1943 reportedly averaged 5,900 metric tons a month compared with 5,500 to 6,000 tons a month in 1942. The concentrate contains slightly more than 50 percent zinc. Production of zinc metal in 1943 was 1,400 metric tons a month (1,100 tons in 1942) according to estimates. Spain is self-sufficient in zinc, and normally a substantial quantity of concentrate is exported. Domestic consumption is increasing as greater amounts of zinc are being substituted for copper, which is in short supply.

Sweden.—It was reported that operations at a refinery in Trollhattan were to begin in the fall of 1943 with expected production to be about 5,000 metric tons a year. This refinery had been shut down since 1925, and Swedish ore was then sent to Belgium and Germany to be refined. Trollhattan also has another refinery that treats zinc dross and other wastes from galvanizing operations. Approximately 5,000 metric tons of such waste can be handled annually. By using the latest methods it is possible to recover nearly 100 percent of the zinc contained in the waste.

LEAD AND ZINC PIGMENTS AND ZINC SALTS

GENERAL SUMMARY

There was substantial improvement in sales of lead and zinc pigments as a whole in 1943, following the 1942 recession from the high rates for 1941, and operations were generally at satisfactory levels. As in 1942, by far the larger part of the orders was to supply Government requirements. Producers were again hampered by the restrictions on supplies of linseed and other drying oils and of slab zinc, and by the limitations on supplies of containers. Curtailment in the use of linseed oil, dehydrated castor oil, and oiticica oil was eased late in 1943 and early in 1944, but producers were still forced to make considerable changes in their manufacturing practices in order to accommodate their Government and civilian customers as nearly as possible. As the year progressed the problem of maintaining adequate experienced workmen in the producing industry became more acute, and early in 1944 the trade reported that anticipated gains in civilian requirements were threatened by an increasing shortage of journeyman painters.

The paint, varnish, and lacquer trade established a new high record for sales by a narrow margin in 1943, according to data of the United States Department of Commerce covering 680 establishments that accounted for approximately 90 percent of the value of the industry as reported in the Census of Manufactures for 1939. The value of sales in 1943 was $568,620,999 compared with $529,745,027 in 1942 and the previous record of $555,398,819 for 1941.

In the first half of the year pigments producers were again able to obtain pig lead more readily than slab zinc, and this factor tended to improve the competitive position of the lead group. As demands for zinc oxide rose, however, and calls for the French process grade increased, manufacturers were permitted enough slabs to fill their essential requirements. With regard to the metals themselves, the supply-requirements position for zinc showed noteworthy improvement during the year, which led to record inventories of this metal at the year end. Supplies of lead from domestic mines and imports, on the other hand, receded from the quantities available for 1942 and failed, by a substantial margin, to equal requirements; as a result, total inventories declined. The situations described are due largely to the stricter Government controls on zinc because of the greater possibility of emergency war needs for this metal than for lead.

The production of titanium pigments failed to equal that in 1942 and in the peak year 1941, despite heavy demand. Sales were greater in 1943 than in 1942 but were below the high record established in 1941; they exceeded production in 1943, and stocks were substantially reduced during the year. The situation regarding titanium pigments supplies reversed itself in 1943. In the latter part of 1942 stocks increased, and the restrictions on titanium pigments were lifted in December. In 1943, on the other hand, the situation became increasingly critical, and Conservation Order M-353 (December 6, 1943) again imposed limitations on the titanium group.

The largest tonnage gain for pigments covered by this report was in the quantity of zinc oxide used for chemical warfare purposes, followed by the increase in the quantity of this same pigment used for rubber manufacture. Litharge consumption in rubber manufacture also rose in 1943. Consumption of pigments for storage-battery manufacture was higher than ever before. Agricultural use of litharge also reached new heights in 1943 and that of zinc sulfate is believed to have been exceeded only in 1942. Consumption of pigments in the manufacture of paint, the largest single use, was somewhat disappointing despite the increase in sales of red lead above the previous peak for 1942 and the rise in sales of zinc oxide for this purpose. Sales of white lead to paint makers dropped 14 percent below 1942 and were 32 percent less than the annual average for the 5-year period, 1935-39. Sales of lithopone and of leaded zinc oxide for this purpose also declined in 1943. For the most part in 1943 the ceramics industry took pigments at the reduced rates of 1942 or below.

An outstanding event of the war period has been the phenomenal growth in the use of zinc yellow as a nonferrous-metal primer. Two articles, published during the year, may be of interest.[1] Callahan said of this pigment "* * * In its contribution to the war effort, zinc chromate stands as the most important single pigment today. * * *" Only one company covered by the canvass of pigments (those that use ore, metal, and scrap) reported the output of zinc chromate as a final product. As other production of zinc chromate is from zinc oxide, it would duplicate the quantities of zinc oxide shown in this report.

The development, on a substantial scale, of zinc borate for use in paint finishes is worthy of note although, owing to the fact that it is reported by only one company, figures for this product also may not be shown. The principal use of zinc borate is in impregnating compositions to impart fire-retardant properties to camouflage netting and duck for military purposes.

On December 15, 1943, Simplified Practice Recommendation R144-43, for paints, varnishes, and related products, became effective.

[1] Callahan, John R., Modernizing Chemical Color Manufacture: Chem. and Met. Eng., vol. 50 No. 6, June 1943, pp. 106-111.
Chemical Industries, Paint Progress: Vol. 53, No. 5, November 1943, p. 714.

Its purpose was to enable the industry to cooperate even more effectively in the war by further reducing the variety of colors. It had been accepted by a substantial percentage of the manufacturers and others concerned and was approved for promulgation by the United States Department of Commerce, through the National Bureau of Standards. The simplification program for limiting the variety of colors of paints, varnishes, and similar products to be manufactured and eliminating superfluous sizes of containers originally became effective in 1924, and the present revision is the fifth.

The container situation was recently described by Callahan.[2]

Three articles presenting several aspects of the paint situation were released in June 1943.[3]

Figures on pigments production in Canada indicate that on the whole 1942 marked a continuation of the advances noted in 1941 and that the industry operated at new record levels in that year; data for 1943 are not yet available. Zinc oxide and lithopone, however, dropped in 1942, leaded zinc and zinc leads making a particularly poor showing. The following statistics cover the quantities (in short tons) used in manufacturing in 1942 (1941 in parentheses): White lead (dry) 2,955 (2,164), white lead in oil 822 (714), basic sulfate white lead 74 (111), red lead 679 (648), litharge 809 (729), zinc oxide (pure) 1,211 (1,589), zinc oxide (leaded) and zinc leads 910 (2,255), lithopone

Salient statistics of the lead and zinc pigments industry of the United States, 1925–29 (average) and 1939–43

	1925–29 (average)	1939	1940	1941	1942	1943
Production (sales) of principal pigments:

Late in 1943 the Zinc Pigment Development Association was formed by the leading British producers of zinc pigments. The stated purpose of the organization is to encourage and develop uses (actual and potential) of zinc pigments by all appropriate means, particularly by making their properties and applications more widely known and appreciated.

POST-WAR PROSPECTS

The pigments industry will undoubtedly share generously in the markets that mark reconversion of industry to peacetime pursuits and in the rehabilitation of the United States and the world after the war. An article by Trigg[4] on the return to peace conditions quotes an estimate of $16,070,000,000 per year of post-war construction and one of the United States Department of Commerce[5] that the entire paint industry could have a $740,000,000 year immediately after victory—a 61-percent increase over 1940 total sales. The F. W. Dodge Corporation estimated that total construction volume in 10 years following the war will average approximately double the average annual volume of the 1930–39 decade, which was a decade of depression and slow recovery. This would be an increase of about 5 percent over the prosperous 1920–29 decade, expressed in pre-war cost levels, the company stated. Trade estimates indicate that automobile manufacture after the war will average 50 percent over the pre-war rate, at least until the pent-up demand has been satisfied. The expected gains indicated above and those in the rubber and other industries that are large pigment consumers point to a higher rate of pigment consumption in the post-war period. The gains for the products covered by this report may not be distributed evenly, but it is safe to conclude that all or virtually all will contribute to the larger business. In the war years lead pigments have had a relatively greater share of the total market than zinc pigments, owing to conditions of easier supply of pig lead than of zinc slabs available for use of the pigments industry.

PRODUCTION

Sales in this report are taken as a better guide to activity in the pigments industry than production because complete data are not available on stocks and because materials classified as production of one item are sometimes sold under another description. Moreover, pigments produced under one classification at a plant are sometimes employed at a plant of another company for blending into another pigment in the lead and zinc group. The Bureau of Mines attempts to eliminate all possible duplication and to tabulate products only in the form in which they enter final use as pigments. Thus the quantities of basic lead sulfate and zinc oxide that are blended to make leaded zinc oxide are omitted, except as leaded zinc oxide. Duplication caused by other blending, which is on a considerably smaller scale, is also avoided insofar as possible. Pigments that are consumed by the producing companies, however, to make products beyond the ones covered by this report—that is, paint, storage batteries, and other articles—are considered as sales.

[4] Trigg, Ernest T., Peace and the Painter: Paint Industry Mag., vol. 59, No. 4, April 1944, pp. 131-134.

[5] Hillhouse, F. B., Paint and its Post-War Prospect: Domestic Commerce, vol. 31, No. 25, December 1943, pp. 14, 22-23.

The total value of lead and zinc pigments in 1943 amounted to $78,157,000, a gain of 11 percent over 1942; except for 1941 it was the largest since 1929.

Lead pigments.—Red lead and litharge made the best showings of the pigments covered by this report, sales of red lead failing by a narrow margin to equal the peak rate for 1941 and those for litharge also being second only to those for 1941, dropping 8 per cent below that year. The poor record for white lead in recent years caused the lead pigments as a whole to fall below the zinc pigments in relation to the pre-war period, 1935–39. In 1943 the value of lead pigments was 29 percent higher than the average for the period 1935–39, compared with 35 percent for the zinc group. If white lead values were omitted from the totals, the gain in the lead pigments value for 1943 over the earlier period changes to 75 percent. The average values received by producers in 1943 showed slight gains, on the whole, over those for 1942. The advances were due to the somewhat higher prices that prevailed after the first month or two of 1942, which held throughout 1943. The average quotation for basic lead sulfate, on the other hand, was reduced in midyear 1942, and the revised quotation continued throughout 1943.

Lead pigments sold by domestic manufacturers in the United States, 1942–43

Pigment	1942			1943		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average

1942	35,865	47,774	7,229	1,181	48,369	128	91,513
1943	39,525	36,642	4,752	845	53,378	79	113,091

Zinc pigments and salts.—In the lead and zinc pigment groups zinc oxide had the largest tonnage and percentage gains in relation to 1942, surpassing the earlier year by 44 percent. In relation to other earlier years, however, red lead and litharge made more favorable showings. Demands for zinc oxide gained rapidly during the year, and in December it was placed under allocation, the terms of which are described in more detail under Zinc Oxide. Leaded zinc oxide sales continued to decline from the 1941 peak record, but they had not been exceeded before 1940. Lithopone sales were virtually the same in 1943 as in 1942, having fallen 1 percent. The average value received by producers for zinc oxide dropped $1.00 a ton, although there was no change in the price quotations for the lead-free grades from the beginning of 1942 throughout 1943. Price gains in the leaded variety after the first quarter of 1942, continuing throughout 1943, caused the producers' average value to rise. Lithopone quotations were unchanged from the beginning of 1942, and the average values of producers were identical.

Zinc pigments and salts sold by domestic manufacturers in the United States, 1942–43

Pigment or salt	1942			1943		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average

Zinc sulfate	14,331	1,179,281	82	15,649	1,261,801	81

[1] Zinc oxide containing 5 percent or more lead is classed as leaded zinc oxide.
[2] Includes a small quantity containing less than 5 percent lead.

Zinc pigments and salts sold by domestic manufacturers in the United States, 1939–43, in short tons

Year	Zinc oxide	Leaded zinc oxide	Lithopone	Zinc chloride (50° B.)	Zinc sulfate
1939	114,552	42,684	142,759	(1)	10,157
1940	113,213	45,362	151,802	(1)	11,937
1941	148,833	68,920	176,642	(1)	19,201
1942	99,677	48,128	137,320	52,374	14,331
1943	143,402	[2] 43,828	135,723	53,707	15,649

[1] Data not available.
[2] Includes a small quantity containing less than 5 percent lead.

Sales of zinc chloride totaled 53,707 tons (50° B.) in 1943, an increase of nearly 3 percent over the quantity for 1942. These figures include the equivalent zinc chloride content of chromated zinc chloride and zinc ammonium chloride sold. Zinc sulfate sales in 1943 were second only to those for 1941, rising 9 percent above 1942.

CONSUMPTION BY INDUSTRIES

White lead.—Total white lead sales (dry and in oil) in 1943 were 9 percent below 1942; they were the smallest since 1933 and except for 1933 and 1932 the smallest since 1893. Dry white lead gained over 1942 and actually was larger than in any years other than 1941 and 5 years in the 1920's. The decrease for the "in oil" variety, therefore, was responsible for the poor showing for total white lead sales, both in relation to the record for 1942 and to that for many earlier years.

White lead is used mainly as a component of paint, 87 percent having been reported as sold for this purpose in 1943. A breakdown of the Other item would undoubtedly add to the paint classification.

Production of white lead totaled 61,129 tons.

Distribution of white lead (dry and in oil) sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Paint	92, 380	73, 137	100, 665	76, 837	66, 441
Ceramics	1, 767	3, 029	3, 704	1, 812	1, 444
Other	4, 282	4, 396	8, 631	4, 990	8, 282
	98, 429	80, 562	113, 000	83, 639	76, 167

Basic lead sulfate.—Basic lead sulfate also is consumed mainly in paints, either directly as a pigment or indirectly through its use as an intermediate product in the manufacture of leaded zinc oxide. The totals shown for basic lead sulfate exclude the product used in blending. In 1943, 5,600 tons were sold for use in the manufacture of leaded zinc oxide.

Production of basic lead sulfate totaled 7,121 tons in 1943.

Distribution of basic lead sulfate sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Paints	5, 170	5, 593	9, 285	7, 733	4, 802
Rubber	140	128	200	89	131
Storage batteries	4	4	8	------------	3
Other	224	475	877	588	661
	5, 538	6, 200	10, 370	8, 410	5, 597

Red lead.—Sales of red lead failed by a narrow margin to equal the peak rate established in 1941. In virtually duplicating the 1941 rate it made the best showing of the pigments covered by this report. As in 1942 and 1941, the high rate of consumption of red lead is due to its application as a construction paint, its use for paints having reached new heights in 1943, but its use in storage batteries (the principal outlet) was below that in 1940 and 1941. In 1943, 42 percent of the red lead sold was for paint, whereas in the 5-year period 1935–39 only 30 percent was destined for this purpose.

Production of red lead amounted to 53,495 tons in 1943 or to almost precisely the quantity of sales.

Distribution of red lead sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Storage batteries	24, 709	26, 718	27, 405	23, 545	26, 616
Paints	11, 421	11, 949	20, 130	21, 017	22, 271
Ceramics	1, 123	1, 117	1, 593	939	622
Other	2, 723	2, 416	4, 710	2, 868	3, 869
	39, 976	42, 200	53, 838	48, 369	53, 378

Orange mineral.—This is the smallest item, in tonnage, covered by the lead and zinc pigments canvass. Its principal use in recent years has been in the manufacture of ink. Sales in 1943 were the smallest on record since statistics for this product were first shown separately in 1889.

Only 3 tons of orange mineral were reported to have been produced in 1943.

Distribution of orange mineral sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Ink manufacture	64	51	98	93	49
Color pigments	40	18	26	7	8
Other	27	68	122	28	22
	131	137	246	128	79

Litharge.—Sales of litharge in 1943 were 24 percent above 1942 and second only to the record for 1941, being 8 percent below that year. This favorable showing was surpassed only by that for red lead, among the pigments covered by this report. The quantities used in storage batteries are well above double those for the next most important class, and in 1943 the quantity so used was greater than in any previous year. In addition to the litharge used to make batteries, the storage-battery manufacturers themselves produce a black or suboxide of lead which they use as a substitute for litharge. In 1943, 60,000 tons of black oxide were produced, or only slightly below the 1941 record of 61,000 tons. These quantities required the use of 57,000 and 58,000 tons, respectively, of pig lead. Black oxide figures are not included in the Bureau of Mines totals for litharge. The consumption of litharge for insecticides in 1942 was considerably under the amounts so used in several previous years. In 1943, however, it surpassed the former peak record for 1941 by 4 percent. Sales for ceramics, chrome pigments, oil refining, and rubber were all above the previous year, but all except rubber were notably below 1941. Sales for chrome pigments manufacture gained 27 percent over 1942, and those for rubber were up 24 percent and the largest since 1930. Litharge sales to varnish makers were at a relatively unchanged rate from 1942.

Production of litharge (112,037 tons in 1943) failed to equal sales by roughly 1,000 tons.

Distribution of litharge sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Storage batteries	39, 754	38, 303	49, 847	43, 630	54, 984
Insecticides	16, 435	16, 041	19, 403	14, 830	20, 236
Ceramics	8, 679	12, 072	18, 285	9, 525	9, 866
Chrome pigments	9, 415	8, 456	13, 927	7, 344	9, 351

Other	3, 558	3, 082	6, 289	4, 187	5, 574
	89, 518	89, 841	122, 280	91, 513	113, 091

Zinc oxide.—This pigment made the largest gain in 1943 of any of the products covered by this report. The increase was partly a reaction from the severe drop in 1942, which had been dictated in part by stringent supplies of zinc metal and scrap and by the uncertainties in connection with the prospective consumption of zinc oxide by the synthetic rubber industry. The main part of the rise in zinc oxide sales was the quantity of pigment used for making smoke mixtures for chemical warfare. Consumption of zinc oxide in the manufacture of rubber—the largest use—increased 29 percent in 1943 and that in paints—second in importance—was 19 percent higher than in 1942. Floor coverings and textiles took 27 percent more zinc oxide in 1943 than in 1942, but the quantity so taken did not show up to advantage in comparison with several years before 1938. The ceramic industry's use of zinc oxide rose in 1943 against the trend for other pigments consumed for this purpose.

Zinc oxide makers were hampered in the first half of the year by their inability to obtain adequate supplies of slab zinc for the manufacture of French-process grades. As the year progressed, however, and demands for zinc oxide increased, the War Production Board released all required metal to the producers.

Production of lead-free zinc oxide amounted to only 123,913 tons, or over 19,000 below sales. Of the total, 101,898 tons were produced by the American process almost entirely from ores or primary residues, 17,844 tons by the French process from metal or scrap, and 4,171 tons by other processes—largely from scrap materials.

On September 13, General Preference Order M-11-A was amended to prevent producers of lead-free zinc oxide from shipping any of their product not previously set aside, as ordered, except (1) to fill orders rated AA-5 or higher, (2) to a person certifying that his stocks and supplies from all sources would be less than 1 ton, or (3) except as otherwise specifically authorized in writing by the War Production Board. On December 29 lead-free zinc oxide was placed under allocation control in a rewriting of Order M-11-A, which listed 26 permitted uses. Deliveries of 2 tons or less could be accepted, under provisions of the order, without obtaining specific authorization of the Board, but only for the uses listed in the revised order.

Distribution of zinc oxide sales, 1939-43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Rubber	70, 187	70, 979	90, 429	52, 717	67, 898
Paints	25, 334	23, 268	30, 304	25, 122	29, 852
Chemical warfare	----	----	----	----	21, 801
Floor coverings and textiles	5, 641	4, 752	6, 991	5, 224	6, 633
Ceramics	6, 572	6, 352	8, 596	2, 934	3, 203
Other	6, 818	7, 862	12, 513	13, 680	14, 015
	114, 552	113, 213	148, 833	99, 677	143, 402

Leaded zinc oxide.—Sales of leaded zinc oxide declined 9 percent in 1943 following the more severe drop of 30 percent in 1942 from the peak rate for 1941. Despite the decreases mentioned, leaded zinc oxide sales for 1943 had not been exceeded before 1940. It is used almost exclusively in the manufacture of paint. The figures for leaded zinc oxide include basic lead sulfate used in blending as indicated under Basic Lead Sulfate.

Leaded zinc oxide sales in 1943 were 11 percent above the production of 39,515 tons. Of the output, 19,235 tons contained over 5–35 percent lead, 16,611 tons 35–50 percent, and most of the remainder more than 50 percent.

Distribution of leaded zinc oxide sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Paints	41,519	44,341	67,472	47,052	42,303
Rubber	1	....	1	....	42
Other	1,164	1,021	1,447	1,076	1,483
	42,684	45,362	68,920	48,128	43,828

Lithopone.—The lithopone statistics in this report are given upon the basis of ordinary lithopone sold as such plus the ordinary lithopone content of the high-strength product. This method of publication is used to conceal the operations of one company which always dominates the output of the high-strength product and is the only producer in some years. Three plants and two companies were involved in high-strength lithopone production in 1943. There was little change in the rate of sales of lithopone in 1943; sales in 1942 and 1943, however, were 33 and 34 percent, respectively, below the peak record in 1929. By far the largest part of sales of lithopone is for the manufacture of paints, 77 percent of the total having been for that purpose in 1943 and 80 percent in 1942. Sales for this purpose fell 5 percent compared with 1 percent for total sales. Floor coverings and textiles take the second largest amounts, but they employed only 11 to 12 percent of the totals for the 2 years. This use gained 1 percent in 1943 but was 14 percent lower than the average for the 10-year period ended 1941. Based upon somewhat incomplete information, separation of the 1943 quantities shown in the following table for floor coverings and textiles indicates that 11,900 tons were used for linoleum and felt-base floor coverings and the remainder for coated fabrics and textiles (oilcloth, shade cloth, artificial leather, and similar products). Other sales in 1943 included 4,043 tons for paper and 1,137 tons (incomplete) for printing ink. Paper gained 18 percent in 1943 and ink 105 percent. Figures for an additional quantity of printing ink cannot be separated from the totals for paint. The principal item under Other uses covers exports. One company, at least, has classified part of its exports according to the end use so that the Other class is too small to cover total exports.

Plant capacity for the production of lithopone was reported to total 157,000 tons, a drop from 182,000 reported for 1942. The drop is explained chiefly by the closing of lithopone operations at the plant of the United Color & Pigment Co. in Newark, N. J. The company reported that the plant was being dismantled early in 1944.

Production of lithopone totaled 132,621 tons in 1943.

Distribution of lithopone sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943
Paints, etc.	113,995	[1] 117,075	[1] 132,691	[1] 109,216	[1] 103,860
Floor coverings and textiles	17,429	18,738	21,114	15,775	15,999
Rubber	3,189	3,387	3,547	1,047	1,078
Other	8,146	12,602	19,290	11,282	14,786
	142,759	151,802	176,642	137,320	135,723

[1] Includes a quantity, not separable, used for printing ink.

The consumption of ordinary-strength lithopone in the manufacture of titanated lithopone (which usually contains about 15 percent TiO_2) amounted to only 8,400 tons in 1943 or to considerably less than half of the record tonnage of 19,400 tons for 1937. This use of lithopone has trended downward almost continuously since the peak was reached. Lower production by the United Color & Pigment Co., mentioned in the preceding paragraph, was chiefly responsible for the drop in 1943. The lithopone figures in the following table are included in the totals for ordinary lithopone in the preceding table.

Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1939–43, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1939	16,100	13,700	1942	11,700	9,900
1940	18,100	15,200	1943	9,800	8,400
1941	16,800	14,100			

Zinc sulfide.—Only one company produced zinc sulfide in 1943 and in 1942, therefore it is not possible to publish totals for this product.

Zinc chloride.—Sales of zinc chloride, in terms of 50° B. solution, totaled 53,707 tons in 1943 compared with 52,374 tons in 1942—a gain of 3 percent. These figures include the zinc chloride equivalent of zinc ammonium chloride and of chromated zinc chloride produced. Comparable data for recent earlier years and complete figures showing distribution of sales by uses are not available.

Zinc sulfate.—Sales of zinc sulfate gained 9 percent in 1943 and were second only to those for 1941, being 18 percent below that record total, however. Rayon resumed its place as the leading use in 1943, having been supplanted by agriculture in 1942 and by chemicals in 1941. A further break-down of the chemical classification, however, probably would add tonnage to several of the groups. Rayon sales increased 44 percent in 1943 and have been exceeded only by those in 1941. The agricultural use has been taking increasing quantities of zinc sulfate, reaching a peak in 1942 from which it dropped 19 percent in 1943. The feature of sales in 1943 was the gain in the quantity for paint and varnish processing. This class gained 27 percent in 1943 to its second successive peak and represented 16 percent of total sales; in 1936 and 1937 it accounted for only 1 and 2 percent, respectively. The chemical class dropped 37 percent in 1943, following a severe decline in 1942. These changes probably indicate that a more precise break-down of end-use information has been possible.

Distribution of zinc sulfate sales, 1939–43, by industries, in short tons

Industry	1939	1940	1941	1942	1943

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND ZINC SALTS

The schedules for compiling statistics on lead, zinc, and lead and zinc pigments and salts in 1943 were changed from those for earlier years to obtain more precise information regarding sources of crude materials used and more data on end products. As a consequence, the figures ordinarily presented in this section of the report on lead and zinc pigments will be no longer available in their previous form. Figures covering lead and zinc in ore and metal and scrap used in making total pigments should be available later in the year and will be released to the public at that time.

PRICES

The total and average values reported by producers for lead and zinc pigments are given in the tables in the first part of this report. Except for basic lead sulfate, average values for lead pigments in 1943 were either the same as in 1942 (as in the case of red lead) or higher by $2 to $11 a ton. In the main the gains were due to the general rise in prices for lead pigments during the first 2 months of 1942, after which quotations were unchanged throughout the remainder of the year and through all of 1943. The rise in quotations for litharge came later in 1942 than the others. The white variety of basic lead sulfate was quoted at 7¾ cents a pound for 3½ months in 1942 but did not go above 7½ cents in 1943; the average value for this product declined in 1943, contrary to the record for other lead pigments.

Prices for pig lead were unchanged throughout 1943 at the levels established by the Office of Price Administration ceiling limitations in January 1942. The ceiling price for common lead, delivered New York, was 6.50 cents a pound. Corroding and chemical grades were allowed premiums of 0.10 cent a pound. The chemical grade, however, was quoted throughout 1943 at 0.05 cent below the ceiling, both at New York and at St. Louis. Ordinarily lead-pigment prices follow closely the price movements in pig lead.

Except for the grades of zinc oxide containing 35 percent or more lead, there were no changes in zinc pigment quotations from the first of 1942 throughout 1943. Leaded zinc oxide values received by producers gained an average of $3 a ton in 1943, whereas the lead-free grade dropped $1 and lithopone was unchanged.

As a rule the relationship between zinc pigment quotations and those for slab zinc are not as close as that among the lead classes. This situation is due largely to the fact that much ore is used directly in the manufacture of zinc pigments, whereas pig lead is the source of most of the lead pigments produced.

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1940–43, in cents per pound

Product	1940	1941	1942	1943
Basic lead sulfate, or sublimed lead, less than carlots, barrels	6.25- 6.75	6.50- 7.00	7.00- 7.75	7.50- 7.75

Zinc sulfate, crystals, barrels	2.90- 3.90	3.15- 4.40	3.65- 4.60	3.85- 4.60

FOREIGN TRADE [6]

As usual, all of the important items in foreign trade in lead and zinc pigments and salts were in the export classification in 1943. The chief value in imports covered zinc sulfate, and its value represented well over half of the import total. Even for this item the balance was strongly in favor of exports, and all other items covered showed export excesses. Lithopone, as usual, was the chief export class in point of tonnage in 1943, and it was followed by zinc oxide, white lead, litharge, and red lead. The exports of no item other than lithopone represented as much as 10 percent of domestic sales and of only white lead as much as 5 percent of domestic sales. Except for the items specified, foreign trade in lead and zinc pigments and zinc salts has little significance. The total value of lead pigments exported rose 50 percent in 1943, but that for the zinc group was relatively unchanged. Value of the two classes plus that for lead and zinc salts gained 19 percent in 1943.

---

GOLD, SILVER, COPPER, AND LEAD IN ALASKA

(MINE REPORT)

By CHAS. W. HENDERSON AND R. V. CUSHMAN

SUMMARY OUTLINE

Page
Summary 225
  Calculation of value of metal production 226
Markets and metallurgy 228
Review by regions 229

SUMMARY

The production of gold in Alaska made a poor showing in 1943. The gold recovered from ores and gravels totaled only 99,583 fine ounces valued at $3,485,405, a decrease of 80 percent from the 1942 production and the lowest quantity mined in the Territory since 1897. The value of the gold in 1943 was 98 percent of the total gross value of the gold, silver, copper, and lead produced. The primary reason for this marked decrease in gold output was the War Production Board Gold Mining Limitation Order L–208 of October 8, 1942, the full effect of which was not felt in Alaska until 1943. Only 7 of the 47 available floating connected-bucket dredges were in operation during the year. These dredges were allowed to work under limited reprieves granted with the provision that only men over draft age and not qualified for any type of war work be employed. One dry-land dredge was in operation in 1943; nearly all earth-moving equipment was disposed of to contractors on Government military projects. Out of the 38 lode mines in operation in 1942, only 8 were active in 1943, but these 8 mines supplied 58 percent of the gold and 88 percent of the silver produced in the Territory. The Alaska Juneau Gold Mining Co. at Juneau was by far the largest producer.

One other important reason for the decrease in the gold output in Alaska in 1943 was the serious shortage of labor at the mines, created by the high wages offered laborers on the numerous Army and Navy construction projects throughout the Territory. A large percentage of the mining in 1943 was carried on by men who, for various reasons, could not work in essential war activities.

The regulations on gold mining were eased slightly by the War Production Board during 1943 to give relief to some of the small placer gold-mine operators in the Territory. The Gold Mining Limitation Order L–208, as originally issued on October 8, 1942, closed down all "nonessential" mines except those lode mines that produced 1,200 tons or less of commercial ore in 1941 (provided the rate of production of such mines did not exceed 100 tons per month), and those placer mines that treated less than 1,000 cubic yards of material in 1941 (provided that the rate of treatment of such placer mines did not exceed 100 cubic yards per month). The order was first amended in the Territory of Alaska in the spring of 1943 to permit small placer-gold mines that employed five men or less (including the owner and associates) to resume operations. The permits granted under this amendment were restricted to the 1943 season. A new grant issued later in the year permitted the employment of seven men instead of five and extended the time limit to an indefinite period. The essential provisions of the permits are as follows:

(*a*) That not more than seven men, including the owner and associates, are actively engaged in the operation.

(*b*) That not more than one of those men, who must be either the owner or supervisor, was residing outside the Territory of Alaska at the date of the issuance of this grant.

(*c*) That no men shall be employed unless, because of age, physical handicaps, or other reasons, they cannot be used in essential war activities.

(*d*) That no critical materials, other than those in the possession of the operator, or available second-hand, will be required.

A bright spot in the future for Alaska mining is the many highways and airfields that have been and are now being built to connect various parts of the Territory. All these new units promise to be especially useful to the mining industry.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

The following tables show the mine production of gold, silver, copper, and lead in Alaska in 1939–43 and 1880–1943, in terms of recovered metals; the output of gold and silver in 1943, by types of operation; and the output of gold, silver, copper, and lead from amalgamation and cyanidation mills (with or without concentration equipment) in 1943, by regions.

Mine production of gold, silver, copper, and lead in Alaska, 1939–43, and total, 1880–1943, in terms of recovered metals

Year	Gold (lode and placer)		Silver (lode and placer)	
	Fine ounces	Value	Fine ounces	Value

Total, 1942	2,814,884	115,304	21,928	2,862	21,968	45,372	41,837	800,209

Gold.—Floating connected-bucket dredges recovered only 19 percent of the total Alaska output of gold in 1943, compared with 51 percent in 1942; only seven dredges operated during the year. Placer mines worked by dragline and dry-land dredges, bulldozers, hydraulic giants, drifting, and sluicing together yielded 23 percent of the total gold in 1943 compared with 21 percent in 1942; the larger producing districts from these types of operations were the Kougarok, Iditarod, Yentna-Cache Creek, and Fairhaven. Lode mines contributed 58 percent of the total Alaska output of gold in 1943 compared with 28 percent in 1942. The Alaska Juneau Gold Mining Co. was again the largest producer of lode gold in Alaska. This property operated at greatly reduced capacity. Its continuance was allowed partly in expectation of handling chromite but mainly because of its importance to the life of the town of Juneau.

Silver.—All the silver produced in Alaska in 1943 was a byproduct of gold mining.

Copper.—About 78 percent of the copper recovered in Alaska in 1943 came from dry and siliceous ores.

Lead.—All the recovered lead output of Alaska in 1943 came from lead concentrates produced at the flotation mill of the Alaska Juneau Gold Mining Co.

MARKETS AND METALLURGY

About 96 percent of the gold and 38 percent of the silver produced from Alaska ores and gravels in 1943 were obtained in the form of gold-silver bullion, virtually all of which was sold finally to the Seattle Assay Office. As there were no smelters or refineries in Alaska, most of the remaining gold and silver produced and all of the lead and copper were obtained from high-grade ore and concentrates shipped to two smelters in the States, namely, the Tacoma (Wash.) and Selby (Calif.) smelters owned and operated by the American Smelting & Refining Co. The two smelters recovered 11 percent of the gold and 67 percent of the silver produced in 1943. The largest private purchasers (or agents) of gold-silver bullion in the Territory and in Seattle, Wash., in 1943 were: The Bank of Fairbanks and the First National Bank of Fairbanks, Fairbanks; the Miners & Merchants Bank of Alaska, Nome; the Miners & Merchants Bank of Iditarod, Flat; the Wiseman Trading Co., Wiseman; the Northern Commercial Co. and the Seattle-First National Bank, Seattle, Wash. The bullion purchased was either sent direct to the Seattle Assay Office or cast into bars for shipping; in many instances the banks acted merely as agents for the lode and placer operations.

Ore-dressing mills active in Alaska in 1943 included the 12,000-ton Alaska Juneau amalgamation-table concentration-flotation mill and five other mills, most of which were amalgamation-flotation plants. With the exception of the Alaska Juneau, no mill had a daily capacity of over 75 tons. Shipments of concentrates from amalgamation or cyanidation mills having concentrating equipment averaged 8.32 ounces of gold and 23.47 ounces of silver to the ton; concentrates from straight concentration mills averaged 2.36 ounces of gold and 3.94 ounces of silver to the ton. All the lead concentrates produced in

1943 were obtained from concentration by flotation of the dry gold ore of the Alaska Juneau Gold Mining Co. property at Juneau.

The United States Assay Office at Seattle, Wash., reports the following receipts from Alaska in 1943.

Bullion of Alaska origin deposited at United States Assay Office, Seattle, Wash., during year ended Dec. 31, 1943, in fine ounces

Region	Gold	Silver	Region	Gold	Silver
Cook Inlet-Susitna	16,271	904	Seward Peninsula	16,986	2,094

Kuskokwim	2,483	191			
Northwestern Alaska	4	----------		95,578	16,170

REVIEW BY REGIONS

Cook Inlet-Susitna region.—This region, which includes the Iliamna, Valdez Creek, Willow Creek, and Yentna-Cache Creek districts, produced 23 percent of the total gold output from lode mines in Alaska in 1943. There was only one producing lode mine in the region compared with 7 in 1942 and 10 in 1941. In the relative order of their total production the districts rank as follow: Willow Creek, Yentna-Cache Creek, Valdez Creek, and Iliamna.

The Willow Creek district, north of Wasilla at the head of Cook Inlet, was in 1943 again the second-largest lode-gold producing district in Alaska. The entire output of the district came from the Independence and Free Gold mines near the head of Fishhook Creek, operated by the Alaska-Pacific Consolidated Mining Co. The mine is equipped with a 75-ton amalgamation-flotation mill and 100-ton sorting plant and was operated continuously until August 8, 1943, at which time the mine and mill were closed down and put in a stand-by condition in compliance with a War Production Board order. The mine produced 16,280 tons of ore during 1943, averaging 0.90 ounce of gold per ton.

The Yentna–Cache Creek district, which includes the area west of the Susitna River drained by the Yentna River and its tributaries, was the largest producer of placer gold in the region. In general, the productive placer creeks are tributaries of Peters, Cache, or Granite Creeks. Six properties operated during the year, all using hydraulic giants to recover gold from stream and bench gravels. The largest producers were the Cache Creek Mining Co. on Cache Creek and Edward Wagner on Bird Creek.

In the Valdez Creek district, which lies north of Anchorage near the head of the Susitna River, Carlson & Associates operated a hydraulic outfit on the Folk bench claim on Valdez Creek. This was the only operation in the district in 1943.

There was no mining in the Iliamna district in 1943.

Copper River region.—The Copper River region includes the Chistochina, Nelchina, Nizina, Prince William Sound, and Yakataga (including Icy Bay) districts. There was no production from the Chistochina, Nelchina, and Prince William Sound districts in 1943.

In the Nizina district two producing mines operated in 1943. The Dan Creek Placer Mines, Inc., did not operate its hydraulic placer mine on Dan Creek 25 miles east of McCarthy in 1943 but did ship 8 tons of crude native copper, which averaged 78 percent copper, to the Tacoma (Wash.) smelter. This was part of a mass of native copper which was found on the property in 1939. The only producer of placer gold in the district was the Chititu Mines Co. operating on bench ground in Rex Gulch, a tributary of Chititu Creek. Four 3-inch Fisher hydraulic giants moved approximately 14,000 cubic yards of gravel, recovering 141.46 ounces of bullion with an average fineness of 0.905 in gold and 0.089 in silver.

Beach gravels and sands, worked by two sluicing operations, yielded the only gold and silver produced in the Cape Yakataga district.

Kenai Peninsula region.—The Kenai Peninsula region includes the Moose Pass-Hope, Nuka Bay-Homer, and Turnagain Arm-Girdwood districts. In 1943 the only production of gold and silver from the region came from one small placer operation in the Nuka Bay-Homer district.

Considerable work has been done in this district in the development of the chromite mines in the Red Mountain area about 10 miles southeast of Seldovia at the south end of Kenai Peninsula. The Chromite Queen Mining Co. operated the Chromite Queen mine in 1943. Part of the ore was shipped to the Metals Reserve Co. stock pile at Seldovia, which was established in 1943 for that purpose. The Red Mountain Chromite, Inc., is developing its mine at Red Mountain, but ore shipments are held up pending completion of a road from the lower tram terminal to the wharf.

Kuskokwim region.—The Kuskokwim region includes the Bethel, Goodnews Bay, McGrath, and Tuluksak-Aniak mining districts, scattered over a large area. Mining activities are handicapped by remoteness from supply and difficulties of transporting materials. There was no production from lode-gold mines in the region. One placer operated in each of the following districts: Goodnews Bay, McGrath, and Tuluksak-Aniak.

The Goodnews Bay Mining Co. operated its floating connected-bucket dredge (equipped with 92 8-cubic foot buckets) and dragline on Salmon River in the Goodnews Bay district from April 28 to November 7. This operation was carried on for the recovery of platinum minerals, but a small quantity of gold was recovered as a byproduct.

In the McGrath district, E. M. Whelan recovered a small amount of gold and silver from the sluicing of bench gravels in the Medfra area.

The New York Alaska Gold Dredging Co., largest gold producer in the region in 1943, operated one of its two bucket dredges on upper Tuluksak River in the Tuluksak-Aniak district and shipped bullion to the Seattle Assay Office.

The development of mercury properties in the Sleitmut-Georgetown area has given an added impetus to mining in the Kuskokwim region. The New Idria-Alaska Quicksilver Mining Co., a subsidiary of the New Idria Quicksilver Mining Co., has taken options on the Red Devil property 8 miles west of Sleitmut and installed a 50-ton Gould rotary furnace, which began operation in October. The Decoursey

Mountain mine, 25 miles northwest of Georgetown, also produced in 1943, using a Gould D-type retort. Several other properties in the area have been examined by the Geological Survey and the Bureau of Mines during the last two years.

Northwestern Alaska region.—Mining in the Northwestern Alaska region in 1943 was confined to a few small hand-operated placers on Dahl and Riley Creeks.

Seward Peninsula region.—Mining operations in the Seward Peninsula region, comprising the Council-Bluff, Fairhaven, Kougarok, Koyuk, Nome, Port Clarence, and Serpentine River districts, were confined to the recovery of placer gold in 1943. Only 4 floating connected-bucket dredges operated in 1943 compared with 14 in 1942. A total of 875,253 cubic yards of gravel containing 10,871 fine ounces of gold and 1,418 fine ounces of silver was handled by the dredges of the region. The average value of the gravel worked, as in 1942, was about 44 cents per cubic yard.

In the Council-Bluff district, the Council Dredging Co. operated its dredge in the Niukluk Valley near Council. It was the only one of seven dredges to operate in the district in 1943. Other placer mining in the district included one hydraulic operation and several small placers operated by hand methods.

The Arctic Circle Exploration Co., largest producer of gold in the Seward Peninsula region in 1943, operated one of its two dredges on Candle Creek in the Fairhaven district. Another bucket dredge (70 buckets of 3-cubic foot capacity) in that district was operated on the Inmachuk River by the Dry Creek Dredging Co. It handled 65,400 cubic yards of gravels and old tailings from June 30 to September 6 and employed seven men, all over draft age. Several hydraulic and smaller placer mines and one drift mine also were in operation in the Fairhaven district in 1943.

No bucket dredges operated in the Kougarok district in 1943. However, numerous placers using dragline, hydraulic, and hand methods worked the gold-bearing gravels in the district; the largest was the operation by Kougarok Consolidated Placers, Inc., on the Kougarok River. Gold is recovered by means of a hydraulic giant, a dragline excavator, and an elevated flume for washing.

The placer production from the Koyuk district in 1943 was recovered from four mines on Dime Creek, all operated by methods other than dredging.

In the Nome district, Lee Bros. Dredging Co. operated one of its two Diesel-powered floating connected-bucket dredges on the Solomon River and handled 300,000 cubic yards of gravel from July 20 to October 28. This was the only dredge in operation in 1943 of the nine dredges in the district. The four dredges in the Snake River area owned by the United States Smelting, Refining & Mining Co. (Nome Department) were idle. Among the larger producers of gold from placers worked by hydraulic giants, with some combination of bulldozers and pumps, were Herbert Engstrom on Clara Creek, B. F. Gillette on Anvil Creek, and E. W. Quigley on Solomon River.

Southeastern Alaska region.—Southeastern Alaska, including the Admiralty Island, Chichagof Island, Hyder, Juneau, Ketchikan, and Windham Bay districts, produced 71 percent of the total lode gold and most of the silver and all the lead output of Alaska in 1943. Only 3 lode mines were active in the region in 1943, compared with 12 in 1942; no placer mines operated.

The Alaska Juneau mine in the Juneau district, though operated at reduced capacity, was the largest producer of gold, silver, and lead in Alaska in 1943. The mine was operated continuously throughout 1943 and part of 1944 but was shut down indefinitely on April 9, 1944. In the Twenty-Ninth Annual Report of the Alaska Juneau Gold Mining Co., for the year ended December 31, 1943, the president's report (dated March 3, 1944) says—

> Those industries which are not maintained wholly or indirectly for the benefit of war efforts have suffered severely by the impact of the conditions and limitations imposed upon them through policy and necessity. Accordingly, the activities of your company during the year under review have suffered curtailment through losses of crew from a normal of about 1,000 men down to about one quarter of that number. This has had a disastrous effect on the financial outcome for the year since the marginal character of operations requires the maximum tonnage output for earning a profit. Throughout the year it has been the policy to conduct operations in the manner that would result in the least financial loss, and in conformance with this policy mining and milling were continued on the best scale possible with the available crew. * * *
>
> The operations for the year resulted in an operating loss, after all charges including depreciation and depletion, of $174,346.06 as a result of mining and milling 1,461,830 tons of ore.
>
> It is quite impossible to forecast the future, since this depends not only on the termination of the war, but also on many factors that will affect Alaska industrial conditions during the early reconstruction period that will follow the war's ending. In any event, operations cannot be resumed until a satisfactory wage scale, based on the price of gold, can be agreed upon.
>
> Inasmuch as all available labor was used in the most essential work, there was a minimum of work done in the mine that was not directly connected with production; accordingly, there is no change in the general appearance of the mine itself. However, in spite of all restrictions, no sacrifices were made to unduly favor production; neither was any effort made during these difficult times to "rob" the mine of its better grade ore, as such an act would unfavorably affect the results of future operations.

The general superintendent's report (dated January 26, 1944) says—

> During the year 1943, the amount of rock trammed from the mine was 1,461,830 tons, as compared to 2,765,190 tons for the previous year and 4,354,770 tons for the year 1941. The North ore body furnished 17 percent of the year's tonnage, the South ore body 13 percent, while the Perseverance section supplied 70 percent of the total.
>
> During the year 117,650 pounds of powder were used in blasting powder drifts, or 0.08 pound per ton trammed. Total powder consumption for primary and secondary breaking was 0.30 pound per ton trammed in 1943, as against 0.28 pound in 1942 and 0.29 pound in 1941. This gives a tonnage ratio of 3.38 tons of ore per pound of powder in 1943, as against 3.55 tons in 1942.
>
> The average daily crew employed on development and preparatory mining for the year was 15.17 as against a normal crew of about 100 men. The present ratio of development and preparatory mining to tonnage output is lower than normal, but is unavoidable under the present operating conditions.
>
> The mine was worked on a two-shift basis during the whole year, while the mill operation was reduced from three shifts to two shifts in March.
>
> *Labor.*—The general shortage of labor increased during the year 1943. The labor turnover, however, was small. The number of employees on the pay roll at the beginning of the year was 478 as against 328 at the end of the year.
>
> The average wage per day in 1943 was $8.58 as against $7.67 in 1942. A large part of this increased wage in 1943 is a result of overtime payments according to Executive Order 9240, which regulates essential industries.
>
> The over-all cost per man per day was $12.47 in 1943 as compared to $11.93 in 1942.

Gold content of ore from Alaska Juneau mine, 1939–43, and total, 1893–1943

Year	Rock to mill from mine (tons)		Gold (ounce)				
			Recovery per ton fine-milled		Losses per ton of tailings		Content of rock from mine to mill

Summary of production and operating costs, Alaska Juneau mine, 1914–43, inclusive

	1,461,830 tons		2,765,190 tons		87,580,024 tons	
	1943	Per ton trammed	1942	Per ton trammed	1914–43	Per ton trammed
Production (gross recovered gold, silver, and lead values):						
Bullion	$1,140,625.95	$0.780	$2,242,104.03	$0.811	$63,477,886.34	$0.725
Concentrates	315,234.81	.216	507,014.16	.183	16,304,206.71	.186
	1,455,860.76	.996	2,749,118.19	.994	79,782,093.05	.911
Costs:						
Mining	726,577.98	.497	1,095,681.58	.396	26,996,031.45	.308
Milling	575,638.09	.394	791,041.94	.286	21,547,693.56	.245
Other Juneau operating and marketing costs	115,604.04	.079	167,492.84	.061	4,285,642.05	.049
General corporation and pay-roll taxes	79,620.56	.054	139,947.19	.051	1,947,166.76	.022
Total Juneau operating and marketing costs	1,497,440.67	1.024	2,194,163.55	.794	54,776,533.82	.624
All other costs	49,762.86	.034	56,392.04	.020	3,644,810.52	.042
Total operating costs and expenses	1,547,203.53	1.058	2,250,555.59	.814	58,421,344.34	.666
Juneau operating profit	[1] 41,579.91	[1] .028	554,954.64	.200	25,006,559.23	.287
Net operating profit	[1] 91,342.77	[1] .062	498,562.60	.180	21,360,748.71	.245
Other revenue (interest, etc.)	89,545.91	....	75,738.81	....	884,937.10	....
Profit before depreciation, depletion, and income taxes	[1] 1,796.86	....	574,301.41	....	22,245,685.81	....

[1] Deficit.

There were also shipments from two other mines in the Juneau district in 1943, both of which were clean-ups. The LeRoy Mining Co. on the LeRoy claim near Lamplugh Glacier shipped gold concentrates recovered from milling operations conducted in 1942. The company did not operate the mine or mill in 1943. Howard C. Hayes reworked old tailings from the Thane mill and shipped gold concentrates to the Tacoma (Wash.) smelter.

The Hirst-Chichagof Mining Co. resumed operations at its mine near the head of Kimshan Cove on Chichagof Island in February 1943 by permission of the War Production Board but was forced to close again in August owing to the difficulties encountered in obtaining labor, supplies, and equipment. The company was the second-largest producer of gold in the region. The bullion product from the operation of the company 35-ton amalgamation-flotation mill was sent direct to the Seattle Assay Office and the concentrates were shipped to the Tacoma (Wash.) smelter.

The Salt Chuck mine of the Alaska Gold & Metals Co. on Prince of Wales Island was the largest producer of copper in Alaska in 1943. Copper concentrates containing gold, silver, and copper were shipped to the Tacoma (Wash.) smelter. The ore from this mine contains palladium in addition to gold, silver, and copper.

There was no production of gold, silver, or base metals in the Admiralty Island, Hyder, or Windham Bay districts in 1943. The Riverside tungsten mine in the Hyder district, owned and operated by the J. H. Scott Co., was worked on an increased scale in 1943. The mine ore was treated in the company mill.

Yukon River Basin region.—The Yukon River Basin region embraces all the territory in the Yukon River Valley in Alaska. It is divided into 20 mining districts, as follows: Bonnifield-Nenana, Chandalar, Chisana, Circle, Delta River, Eagle, Fairbanks, Fortymile, Goodpaster, Hot Springs, Hughes, Iditarod, Innoko, Kantishna, Koyukuk, Marshall, Rampart, Ruby, Tolovana, and Yukon Flats. The region was the second-largest producer of gold and silver in the Territory and produced 23 percent of the total gold in 1943.

Only two floating connected-bucket dredges operated in the region in 1943 compared with 15 in 1942. Alluvial Golds, Inc., operated its W. W. Johnson Co. dredge (with 72 4-cubic foot buckets) on Woodchopper Creek in the Circle district and handled about 199,500 cubic yards of gravel. The dredge was operated chiefly to give employment to the older men in the area who are beyond military age. The Ganes Mining Co. operated its dredge (64 3½-cubic foot buckets) on Ganes Creek in the Innoko district from July 9 to October 9, 1943. The company obtained permission from the War Production Board to resume operations in 1943, provided only men over the draft age and not otherwise qualified for any type of war work were employed.

The Alaska gold properties of the United States Smelting, Refining & Mining Co., including eight floating connected-bucket dredges in the Fairbanks district, were closed throughout 1943 following the Gold Mining Limitation Order in the fall of 1942. The company still keeps 15 to 20 men over 55 years of age employed to care for the dredges and thawing equipment and to maintain a small flow of water to prevent damage. Some of the buildings have been leased to the Northwest Service Command, and the revenues are used to defray some of the shut-down expenses. The dredges are being maintained in good condition, and a large yardage of proved ground is available when operations can be resumed.

In addition to the two dredges, about 21 hydraulic operations and 33 placer operations of all other types were active in 1943 throughout the Yukon River Basin region.

In the Bonnifield-Nenana district only a few small placer camps, using hand methods alone, operated in 1943.

Placer mining in the Chisana district was limited to the operations of five prospectors using simple hand methods.

In the Circle district two hydraulic mines were in operation in addition to the Alluvial Golds, Inc., dredge. The largest producer was John A. Anderson, who washed about 8,000 yards of gold-bearing gravel on Mastodon Creek with three 2-inch hydraulic giants.

There were only three small producers, including one hydraulic operation, in the Eagle district in 1943.

Placer mining in the Fairbanks district was limited to the operations of one hydraulic mine worked by Fred C. Bleecher on First Chance Creek and two small hand placers on Fox and Yankee Creeks.

Larger placer operators in the Fortymile district were Koland & Kirkpatrick, operating a hydraulic giant and bulldozer on the Lost Chicken Hill mines on Fortymile River, and Aaron Johnson, operating one hydraulic giant on Chicken Creek, a tributary of Fortymile River.

In the Hot Springs district the most productive placer mining was done by J. R. Frank & Co., which operated two hydraulic giants at its claim on the right limit of Pioneer Creek from May 20 to September 18, and Johnson & Johnson Co., hydraulicking on Glenn Gulch, both in the Eureka area.

In the Iditarod district the Awe Mining Co., Peter Miscovich & Sons, Uotila & Ogriz, Backstrom & Olson, Fred Lusher, and Frank Salen all operated during the 1943 season, using bulldozers and hydraulic giants. The district showed the largest production of gold from placer mining other than dredging in the Yukon River Basin region in 1943.

Degnan & Rosander operated its hydraulic-bulldozer equipment on Little Creek, a tributary of Innoko River 5 miles above Ophir, and handled old dredge tailings and stream gravel. Moreover, several small placer miners using hand methods worked in the district.

The only producer of gold in the Kantishna district in 1943 was Dewey Burnett, operating a small placer on Crooked Creek, a tributary to Toklat River.

In the Koyukuk district about 8 camps recovered placer gold in 1943. In addition to one hydraulic mine operating on Thompson's Pup, a tributary of Fay Creek, there were small mines using hand methods on Nolan, Archibald, and Porcupine Creeks and on Hammond River. Most of the mines were developed by surface methods, but at a few places deep ground was drifted.

A small amount of gold was recovered from ground sluicing of stream gravels on Little Minook Creek, 7 miles southeast of Rampart in the Rampart district, by the Little Minook Mining Co. One other productive camp in this district in 1943 was the Ben Dahl mine on Hunter Creek operated by Ben Dahl.

Other large producers among these types of placer operations in the Yukon River Basin region in 1943 were the Long Creek Mining Co. on Long Creek in the Ruby district and the Amy Creek Mining Co., John Jurich, and John Radak in the Tolovana district.

Lode mining in the Yukon River Basin region produced only 3,561 fine ounces of gold and 862 fine ounces of silver in 1943 compared with 14,478 ounces of gold and 3,441 ounces of silver in 1942.

The only producer of lode gold in the region in 1943 was the Cleary Hill mine and amalgamation-flotation mill in the Fairbanks district 27 miles northeast of Fairbanks. Bullion was shipped to the Seattle Assay Office and gold-silver concentrate containing a small amount of lead to the smelter at Tacoma, Wash. This company is also developing two tungsten mines in this district in the vicinity of Gilmore Dome at the head of Gilmore Creek.

In the Kantishna district Earl Pilgrim operated the Stampede antimony mine during 1943 and produced high-grade antimony ore and concentrates.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN ARIZONA

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

	Page		Page
Summary	237	Mining industry	243
Calculation of value of metal production	238	Ore classification	244
Mine production by counties	242	Metallurgic industry	244
		Review by counties and districts	249

SUMMARY

The total value of the output of recoverable metals from Arizona mines was $121,212,902 in 1943 compared with $114,525,600 in 1942—a 6-percent increase (see fig. 1); it was the greatest value since 1929, when the total was $155,567,133. Both the quantity and value of copper and zinc increased substantially in 1943; the quantity of lead decreased, but its value increased owing to the higher average price of the metal; and both the quantity and value of gold and silver were much less than in 1942. The total value of the copper was $104,827,060—a 10-percent gain over 1942; lead, $2,059,050—a 4-percent gain; and zinc, $4,250,232—a 23-percent gain. The value of the gold was $6,013,350—a 32-percent loss; and silver, $4,063,210—a 19-percent loss. The gold production represented 5 percent of the State total value, silver 3 percent, copper 86 percent, lead 2 percent, and zinc nearly 4 percent. The value of the metals recovered from copper ore and its products was $112,020,217 in 1943, or 92 percent of the State total. The output of copper was greater in 1943 than in any year except 1929, when it was 830,628,411 pounds; and the output of zinc exceeded the record output of 1942.

Production of copper, lead, zinc, and silver in Arizona in 1943 was affected by several factors: A serious shortage of labor, which persisted throughout the year; the construction (by the Defense Plant Corporation) of an additional concentrator of 15,000 tons daily capacity at the Morenci property of the Phelps Dodge Corporation; the completion in May of a 10,000-ton flotation plant at the Castle Dome Copper property near Miami; the milling of copper ore, beginning in March, in the new 2,500-ton concentrator at the Bagdad property near Hillside; the milling of zinc-lead ore, beginning in September, from the San Xavier mine near Tucson by the Eagle-Picher Mining & Smelting Co.; the shipping of zinc-lead ore, beginning in November, from the Copper Queen mine at Bisbee; the decrease in output of zinc-lead ore and the lower grade of ore at the Trench-Flux group; and the marked decline in output of copper from the Ray and United Verde properties.

The Government gold-mine closing order issued in October 1942 resulted in an unusually large decrease in output of siliceous ores in 1943, especially gold ore, as nearly all large producers of gold ore were idle throughout the year.

The basic Government policy of premium payments for overquota production was in force throughout 1943; however, the War Production Board announced November 9 that no applications would be considered after December 31, 1943, for the special copper premium price; that effective October 27 premium prices in the B range would be denied to lead mines not already operating and to lead mines having a low labor productivity and in areas of serious labor shortage; that premium prices in the B and C ranges would be denied to zinc mines not already operating and to zinc mines having a low labor productivity and in areas of serious labor shortage; and that the Government is not now financing new zinc projects. The War Production Board stated that the curtailment in the copper premium price was necessary owing to the success of efforts toward balancing the copper supply with the requirements of the armed services and the most essential civilian uses. Restrictions were placed on lead and zinc premium prices because of increased mineral production, revised military requirements, and a greater need of manpower in the larger producing mines.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1939–43, and total, 1860–1943, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	976	142	18,793,260	316,453	$11,075,855	7,824,004	$5,310,839

1943	315	14	4	....	....	....	....	....	319	14

[1] Includes placer sands treated by dry concentration plants.

[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

[3] Figures for dragline floating dredges include those for dry-land dredges.

Gold.—The output of recoverable gold in Arizona in 1943 was 171,810 fine ounces—a 32-percent decrease from 1942. Gold from siliceous ores (chiefly dry and siliceous gold ore) declined 68,426 ounces, or more than 72 percent, and that from copper ore nearly 8 percent; gold from zinc-lead ore increased nearly 16 percent. The gold output decreased sharply in the strictly gold-producing districts, such as the San Francisco (Oatman, Goldroad, Katherine), Weaver (Octave), Martinez (Congress), and Vulture. Gold from placers declined from 2,836 to 319 ounces, as no dredges of any type operated in Arizona in 1943. The Copper Queen (Bisbee) branch of the Phelps Dodge Corporation continued to be the leading gold producer in Arizona; it was followed by the New Cornelia mine in Pima County, the United Verde mine in Yavapai County, the Mammoth-St. Anthony Limited property and the Magma mine (both in Pinal County), and the Iron King mine in Yavapai County; these six properties produced 85 percent of the State total gold. Copper ore yielded 78 percent of the State total gold, siliceous ores 15 percent, and zinc-lead ore nearly 6 percent. The chief gold-producing districts in Arizona were the Warren, Ajo, Verde, Old Hat, Pioneer (Superior), and Big Bug.

Silver.—The output of recoverable silver in Arizona in 1943 was 5,713,889 fine ounces—a 19-percent decrease from 1942. The chief decreases were 626,548 ounces in silver from copper ore, 539,097 ounces from siliceous ores, 117,594 ounces from zinc-lead ore and zinc-lead-copper ore, 41,501 ounces from zinc ore and zinc-copper ore, and 25,450 ounces from lead ore. Copper ore yielded 76 percent of the State total silver, zinc-lead ore 11 percent, siliceous ores 7 percent, zinc-copper ore 3 percent, zinc-lead-copper ore 1 percent, and lead ore 1 percent. The Phelps Dodge Corporation continued to be the chief silver producer in Arizona, although its output was 12 percent less than in 1942 (decrease mainly at United Verde mine); its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 69 percent of the State gold output, 66 percent of the silver, and 58 percent of the copper. Other large silver producers in Arizona in 1943 were the Magma, Iron King, Trench-Flux, Ash Peak, and Shattuck Denn properties. The chief silver-producing districts were the Warren (Bisbee), Verde (Jerome) Ajo, Pioneer (Superior), Big Bug, Harshaw, and Copper Mountain (Morenci); more than 57 percent of the State total silver came from the Warren and Verde districts.

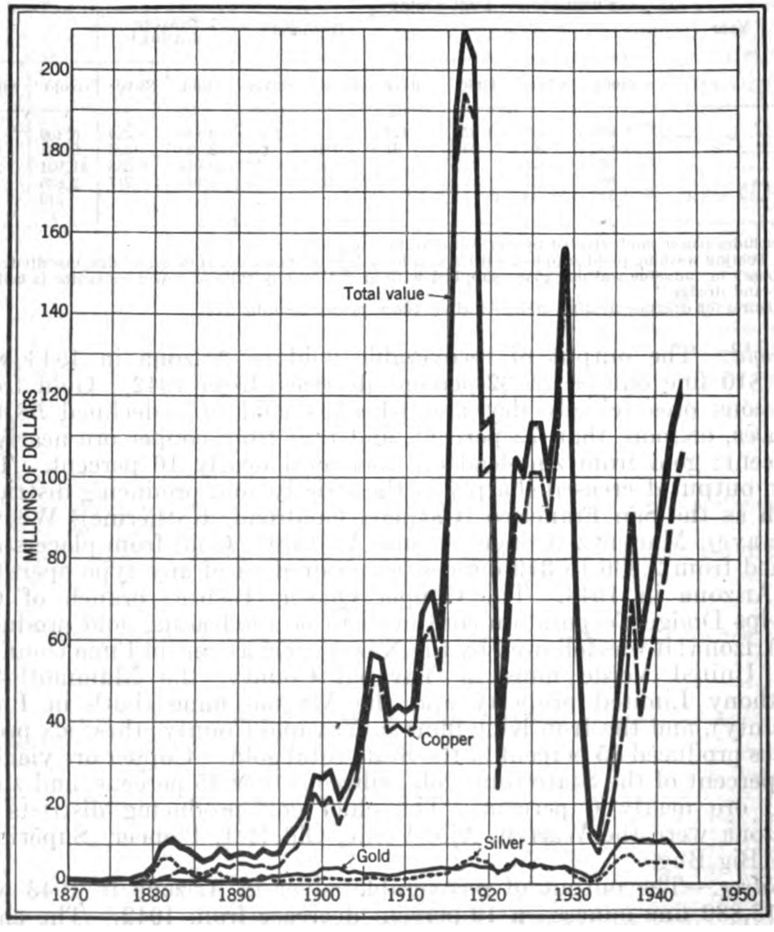

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870-1943. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Copper.—Arizona has been the outstanding producer of copper in the United States since 1907 except in 1909, when Montana held first place. The output of recoverable copper in Arizona in 1943 was 806,362,000 pounds—an increase of more than 2 percent over 1942 and larger than in any year except 1929, when it was 830,628,411 pounds. The Globe-Miami district, with a production of 201,026,600 net pounds of copper, continued to be the leading copper area in the State; it was followed by the Copper Mountain (Morenci) district with 168,694,400 pounds, Ajo with 140,138,000 pounds, Warren (Bisbee) with 101,572,900 pounds, Mineral Creek (Ray) with 74,868,400 pounds, Verde (Jerome) with 68,467,100 pounds, and Pioneer (Superior) with 37,640,000 pounds. Marked increases in copper output were made in the Copper Mountain, Globe-Miami, and Ajo districts, but substantial decreases were recorded in the Mineral Creek, Verde, Warren, and Pioneer districts; these seven districts contributed 98 percent of the State total copper. Copper ore and its products yielded 801,786,501 pounds of copper, as follows: 30,595,456 tons of copper ore treated by concentration yielded 68 percent; 1,704,698 tons of copper ore shipped crude to smelters, 17 percent; and 3,721,926 tons of copper ore leached and 25,260 tons of cement copper (from mine-water precipitates and underground leaching operations); 15 percent. The Morenci branch of the Phelps Dodge Corporation was the largest copper producer in Arizona in 1943; it was followed in order by the New Cornelia branch of the Phelps Dodge Corporation, Inspiration, Copper Queen, Ray (Nevada Consolidated Copper Corporation), Miami, United Verde, Magma, and Castle Dome properties.

Lead and zinc.—The output of recoverable lead in Arizona in 1943 was 27,454,000 pounds—a 7-percent decrease from 1942. The output of recoverable zinc was 39,354,000 pounds—the largest in any year in the history of the State and 6 percent more than the record output of 1942. The marked decrease in lead output from the Trench-Flux group caused a decline in the State lead output, and the production of zinc from the San Xavier and Copper Queen mines during the last quarter of the year prevented a decline in the State zinc output. About 30 percent of the State total lead and 27 percent of the zinc came from mines near Patagonia in Santa Cruz County, 24 percent of the lead and 33 percent of the zinc from Pinal County, nearly 10 percent of the lead and 16 percent of the zinc from Yavapai County, and 10 percent of the lead and 8 percent of the zinc from Mohave County; most of the remaining lead and zinc output came from Cochise and Pima Counties. About 74 percent of the total lead and nearly 68 percent of the total zinc came from zinc-lead ore; nearly all the rest of the lead came from lead ore, siliceous ores, zinc-lead-copper ore, zinc-copper ore, and zinc ore; and all the rest of the zinc came from zinc-copper ore, zinc-lead-copper ore, and zinc ore. The Trench-Flux group of the American Smelting & Refining Co. near Patagonia in Santa Cruz County continued to be the leading producer of lead in the State; it was followed in order by the Mammoth-St. Anthony Limited property at Tiger, Tennessee mine at Chloride, Iron King mine at Humboldt, Arizona Lead Co. property near Yuma, Copper Queen mine at Bisbee, and San Xavier mine near Tucson. The principal producer of zinc in the State in 1943 was the Magma mine at Superior; it was followed in order by the Trench-Flux, Iron King, Mammoth-St. Anthony Limited, Tennessee, Duquesne, San Xavier, and Copper Queen properties.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	22	1	57, 217	$2, 002, 595	2, 278, 672	$1, 620, 389
Coconino	5		13	455	3, 849	2, 737
Gila	23		2, 468	86, 380	122, 203	86, 900
Graham	4		57	1, 995	1, 613	1, 147

Gold and silver produced at placer mines in Arizona in 1943, by counties, in fine ounces, in terms of recovered metals

County	Sluicing [1]		Drift mining		Dredges				Total	
					Dry-land [2]		Dragline floating [2]			
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
Cochise	1								1	
Mohave	2								2	
Pima	4								4	
Yavapai	302	14							302	14
Yuma	6		4						10	
	315	14	4						319	14
Total, 1942	885	176			35	5	1,916	217	2,836	398

[1] Includes placer sands treated by dry concentration plants.

[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

In spite of a serious labor shortage throughout 1943 in the large copper-producing and zinc-lead districts of Arizona, more ore was mined than in any year in the history of the State. The total (36,630,788 tons) exceeded the record production of 1942 by 2,710,057 tons. The output of copper ore was 36,022,080 tons—the largest ever made and a 10-percent gain over 1942; zinc-lead ore and zinc-lead-copper ore, 289,369 tons—a 9-percent gain; lead ore, 41,006 tons—a 58-percent gain; and zinc ore and zinc-copper ore, 91,966 tons—a 19-percent loss. The output of siliceous ores (chiefly gold ore) was 186,185 tons compared with 657,942 tons in 1942—a 72-percent decline, resulting from the closing in 1942 of nearly all the gold mines. Of the total ore, 35,561,059 tons (97 percent) was copper ore mined in the Globe-Miami, Copper Mountain (Morenci), Ajo, Mineral Creek (Ray), Warren (Bisbee), Verde (Jerome), and Pioneer (Superior) districts; 95 percent of the total zinc-lead ore was mined in the Big Bug, Harshaw, Old Hat (Oracle), Wallapai (Chloride), Pima, and Warren (Bisbee) districts; all the zinc-lead-copper ore came from one property in the Patagonia district; nearly all the zinc-copper ore from one mine in the Pioneer (Superior) district; and 66 percent of the lead ore from one property in the Castle Dome district. Nearly 88 percent of the State total gold ore came from three properties in the Old Hat (Oracle), San Francisco, and Vulture districts; 90 percent of the gold-silver ore from two mines in the Verde (Jerome) district; and 75 percent of the silver ore from one mine in the Ash Peak district. Mining operations at two open pits—Ajo and Morenci—produced a total of 18,609,014 tons of copper ore.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Arizona in 1943, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	56	138,144	23,019	48,540	158,370	1,311,027	----------
Dry and siliceous gold-silver ore	12	23,662	2,097	91,154	491,545	15,255	----------
Dry and siliceous silver ore	16	24,379	768	246,515	19,710	4,292	----------
	84	186,185	25,884	386,209	669,625	1,330,574	----------
Copper ore	118	36,022,080	133,746	4,367,003	[1] 801,786,501	19,179	----------
Lead ore	67	41,006	1,131	76,019	60,203	4,621,086	----------
Lead-copper ore	2	182	1	2,393	9,085	26,415	----------
Zinc ore	5	3,083	11	11,588	36,879	70,734	697,166
Zinc-copper ore	3	88,883	1,004	152,242	2,049,366	303,800	9,259,812
Zinc-lead ore	33	262,630	9,699	640,558	1,183,021	20,277,112	26,635,922
Zinc-lead-copper ore	1	26,739	15	77,863	567,320	805,100	2,761,100
Total, lode mines	[2] 274	36,630,788	171,491	5,713,875	[1] 806,362,000	27,454,000	39,354,000
Total, placers	19	----------	319	14	----------	----------	----------
	293	36,630,788	171,810	5,713,889	[1] 806,362,000	27,454,000	39.354,000
Total, 1942	678	33,920,731	253,651	7,064,467	[3] 786,774,000	29,544,000	37,044,000

[1] Includes 117,416,341 pounds recovered from ore leached and mine-water precipitates.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 129,292,755 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

Of the 36,630,788 tons of ore produced in 1943 in Arizona, 30,986,501 tons (nearly 85 percent) were treated at concentration plants; 3,721,926 tons (10 percent) at a leaching plant; 144,342 tons (less than 1 percent) at amalgamation, cyanidation, and cyanidation-concentration mills; and 1,778,019 tons (5 percent) were shipped crude to smelters.

Gold ore treated at amalgamation mills decreased from 765 tons in 1942 to 4 tons in 1943 and siliceous material treated at cyanidation and cyanidation-concentration plants from 542,916 to 144,338 tons; 4 straight cyanidation plants treated 24,700 tons of material in 1943 compared with 15 plants that treated 337,350 tons in 1942. The most important plants were those at the Mammoth-St. Anthony Limited, Iron King, and Gold Standard properties; only one plant remained in operation at the close of the year. Three companies reported cyaniding 110,971 tons of siliceous material and using 6,833 pounds of sodium cyanide, 243,100 pounds of Aero Brand calcium cyanide, 5,930 pounds of zinc dust, 284,740 pounds of lime, and 11,000 pounds of copperas.

Ore treated at concentration plants in 1943 comprised chiefly 30,595,456 tons of copper ore, 226,886 tons of zinc-lead ore, 88,883 tons of zinc-copper ore, 29,006 tons of lead ore, and 26,739 tons of zinc-lead-copper ore. Copper ore from the Miami property was treated by a combination of leaching and concentration, and copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration. The large copper-concentration plants at Ajo, Clarkdale, Hayden, Miami, Morenci, and Superior were operated at capacity in 1943, as well as the copper-leaching plants at

Inspiration and Miami and the copper smelters at Clarkdale, Douglas, Hayden, Miami, Morenci, and Superior. The rated capacity of charge of the six copper smelters was as follows: Clarkdale, 1,400,000 tons per year; Douglas, 1,600,000; Hayden, 360,000; Miami, 360,000; Morenci, 450,000; and Superior (Magma), 210,000. The Phelps Dodge Corporation reported that the Douglas smelter operated throughout the year on a three-furnace basis and smelted a total of 1,162,830 tons of new material. This plant has been operating continuously at maximum capacity for a longer than normal period; as a result, heavy repairs became necessary at the end of the year. At the Clarkdale smelter, two reverberatory furnaces operated continuously, but the average smelting rate was lower than in 1942; 875,953 tons of new material were treated in 1943. The Morenci smelter treated a total of 443,373 tons of new material; construction work on the extension to the smelter was carried on throughout the year. The 20-ton smelter at Tiger is the only lead smelter in Arizona; it operated exclusively on concentrates from the mill of Mammoth-St. Anthony, Limited.

The following tables give details of the treatment of all ores produced in Arizona in 1943.

Mine production of metals in Arizona in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	4	21	3			
Ore, old tailings, and current tailings cyanided	144,338	4,755	25,782			
Concentrates smelted	1,420,677	89,015	2,501,717	553,232,888	24,658,846	39,242,425
Ore smelted	1,778,019	77,700	3,186,373	135,712,771	2,795,154	111,575
Copper precipitates smelted	25,260			[1] 37,361,514		
Copper ore leached	[2] 3,721,926			80,054,827		
Placer		319	14			
		171,810	5,713,889	806,362,000	27,454,000	39,354,000
Total, 1942		253,651	7,064,467	786,774,000	29,544,000	37,044,000

[1] Distributed as follows: Cochise County, 990,877 pounds; Gila County, 13,643,117 pounds; Greenlee County, 9,885,950 pounds; Pinal County, 12,300,000 pounds; and Yavapai County, 541,570 pounds.

[2] Treated by straight leaching at 1 plant in Gila County.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Arizona in 1943, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

County	Material treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal

---

[1] Ellsworth district lies in both Maricopa and Yuma Counties.

[2] Old Hat district lies in both Pima and Pinal Counties.

Comment on districts with small production has been omitted owing to lack of space.

COCHISE COUNTY

California district (*Hilltop*).—A lessee operated the Crosby mine near Portal for a short time in 1943 and shipped 108 tons of crude copper ore to a smelter; 3 tons of lead ore were produced from the Last Chance claim.

Cochise district.—The old Centurion mine at Dragoon was taken over in 1943 by the Captain Copper Co. A Reconstruction Finance Corporation loan of $5,000 enabled the company to clean out and rehabilitate the underground workings of the mine, and during the year 193 tons of carbonate copper ore were shipped to a smelter.

Dos Cabezas and Tevis district.—Mining operations at the Tout group near Dos Cabezas during the last 3 months of 1943 produced 79 tons of copper ore; a small lot (5 tons) of gold ore from the Gold Prince mine was sold to an ore buyer in Douglas.

Golden Rule (*Dragoon*) *district.*—The total output of the Golden Rule district in 1943 was 216 tons of zinc-lead ore from the Scenica mine and 195 tons of zinc ore from the Dragoon Zinc mine shipped to the Shattuck Denn custom mill at Bisbee.

Hartford (*Huachuca Mountains*) *district.*—Mining operations at the State of Texas mine near Hereford produced 832 tons of zinc-lead ore in 1943, which was shipped to the Shattuck Denn custom mill at Bisbee; crude lead ore (91 tons) produced from the Armistice property was shipped direct to a smelter.

Swisshelm district (*Elfrida*).—Lessees operated the Scribner mine during the first 2 months of 1943 and shipped 276 tons of silver-lead ore to the smelter at El Paso, Tex.

Tombstone district.—The principal output in the Tombstone district in 1943 was silver-lead ore (3,729 tons) from the Tombstone Extension mine, operated throughout the year by lessees; part (890 tons) of the ore was treated by gravity concentration, and the remainder (2,839 tons) was shipped direct to a smelter. Silver-lead ore was shipped also from the Mustang and Tombstone properties, and 60 tons of old waste-dump ore (lead) from the San Diego property were treated by gravity concentration.

Turquoise district (*Courtland, Pearce, Gleeson*).—Approximately 625 tons of ore were produced in the Turquoise district in 1943; most (495 tons) of it was crude silver-lead ore from the Defiance mine near Gleeson, and the rest was mainly silver-copper ore (55 tons) from the Black Diamond mine and lead ore (46 tons) from the Tom Scott mine.

Warren district (*Bisbee, Warren*).—The total output of ore in the Warren district was 1,201,179 tons in 1943 compared with 1,210,176 tons in 1942; the principal output continued to be copper ore from the Copper Queen branch of the Phelps Dodge Corporation. The company reported that 1,126,838 tons of copper ore were shipped direct to the smelters at Douglas and Clarkdale; these shipments included 143,657 tons of low-grade marginal ore mined for the account of Metals Reserve Co. and sent to Clarkdale for treatment, and 247,418 tons of siliceous flux ore produced from the "Southeast Extension" porphyry ore body for the Douglas smelter. In addition 917 tons of copper precipitates were produced by the surface and underground precipitation plants, and 6,135 tons of zinc-lead ore were shipped to the Shattuck Denn custom mill at Bisbee.

According to the company printed annual report for 1943, exploration and development during the year comprised 49,049 feet of drifting, crosscutting, and raising, 7,323 feet of stope preparation, and 22,552 feet of diamond drilling. Ore developments resulting from the exploration and development were satisfactory, particularly in the extension of known ore bodies. Further development of zinc-lead ores in mineralized areas east of the Campbell fault gives encouragement for the future exploration of these areas. The Cole division continued to open up satisfactorily, and extensions to the main ore body were found on the 1,100 and 1,300 levels.

The Shattuck Denn Mining Corporation operated its Denn mine and 150-ton flotation mill at Bisbee continuously; the mill treated principally zinc-lead ores received from custom shippers. In all, 20,253 tons of ore (including 4,255 tons from the Denn mine) were treated in 1943 (containing an average of 0.02 ounce of gold and 3.17 ounces of silver to the ton, 0.74 percent copper, 6.43 percent lead, and 12.65 percent zinc) and yielded 2,057 tons of lead-copper concentrates and 3,581 tons of zinc concentrates. In addition to the 4,255 tons of zinc-lead ore, 59,710 tons of copper ore were produced from the Denn mine and shipped to the smelter at El Paso, Tex. The rest of the district output was mainly copper ore (3,843 tons) and lead ore (343 tons) shipped from the Shattuck mine by lessees.

COCONINO COUNTY

Havasu Canyon (Supai) district.—The Johnson mine on Havasu Creek 1½ miles below Supai was operated in 1943 by the Havasu Lead & Zinc Mining Co.; 156 tons of high-grade silver-lead ore were shipped to the smelter at El Paso.

Jacob Canyon and Warm Springs district.—The output of 4,844 tons of ore in the Jacob Canyon and Warm Springs district in 1943 was carbonate copper ore shipped to smelters; all but 8 tons were mined by a power shovel from shallow surface pits at the Mackin-Kennedy-Ryan group and the Petoskey group by the Apex Mining Co.

Kaibito Plateau district.—Lessees operated the Mardun property 57 miles north of Cameron in 1943 and shipped 261 tons of carbonate copper ore to the smelter at Clarkdale.

GILA COUNTY

Banner and Dripping Springs district.—The Sam Knight Lease operated the Christmas mine near Winkelman throughout 1943 and shipped 27,330 tons of crude copper ore to the smelter at Hayden; the ore averaged only 2.08 percent copper, but it is greatly desired by the smelter owing to its high silica content. The rest of the district output was mainly zinc-lead ore (5,327 tons) from the "79" mine shipped to the Shattuck Denn custom mill at Bisbee and copper ore (438 tons) shipped direct to a smelter from the Columbia property.

Globe-Miami district.—The Globe-Miami district, with a production of 201,026,600 net pounds of copper in 1943 (188,529,000 net pounds in 1942), remained the chief copper-producing area in Arizona. The Inspiration property, with a yield of 110,259,203 net pounds of copper, was again the outstanding producer of copper in the district and ranked third in the State. The Inspiration Consolidated Copper Co. reported that 3,721,926 tons of ore, averaging 1.20 percent copper, from which the slimes had been removed, were treated by ferric sulfate leaching; the slimes (306,626 tons averaging 1.546 percent copper) removed from the ore and 1,149,155 tons of additional crude ore, averaging 1.165 percent copper, were treated at the concentrator to recover the sulfide copper, and the tailings were treated with sulfuric acid to dissolve the oxide copper. In addition, 4,409 tons of crude copper ore, 249 tons of leaching-plant cleanings, and 69 tons of mine-water precipitates were shipped direct to the International smelter at Miami.

According to the printed annual report of the company for 1943, ore mined during the year totaled 5,182,116 dry tons assaying 1.213 percent copper, of which 0.634 percent was oxide copper and 0.579 percent sulfide. The average quantity of ore mined per working day was 16,663 tons or 24.23 tons per man-shift, compared with 26.91 tons per man-shift in 1942 and 32.51 tons in 1941. The low rate per man-shift in 1943 was largely due to inefficiency of available labor. It was impossible to maintain maximum production throughout the year owing to an acute shortage of labor in both the mining and metallurgical departments. With the assistance of Government agencies, every effort was made to recruit labor. The shortage in the mining department was somewhat alleviated by the assignment of men furloughed from the Army. Many of these men, however, were unfamiliar with metal-mining practices. The shortage in the metallurgical department was virtually unrelieved. Underground development during the year totaled 67,173 feet of drift and raises and 6,887 cubic yards of miscellaneous excavation.

The Miami Copper Co. operated its mine, 18,000-ton concentrator, and 3,000-ton leaching plant continuously; 5,273,828 tons (5,922,250 tons in 1942) of ore, averaging 0.715 percent copper, were treated by the leach-float process; and 6,073 tons of copper precipitates were produced from leaching in place. Molybdenum concentrates were recovered as a byproduct in treating copper ore.

According to the company printed annual report for 1943 the combined production of Miami Copper Co. and of Castle Dome Copper Co., Inc., its wholly owned subsidiary, was 88,706,828 net pounds of copper in 1943; Miami produced 70,686,762 and Castle Dome 18,020,066 net pounds. This combined production, accomplished despite the manpower shortage, exceeded the production of the company in any year in its history. Mining at the Miami mine was continuous throughout the year in the sulfide ore body; but operations in the mixed ore body, which began in July 1934, ceased May 7, 1943, when the ore body was completely mined out. Leaching of broken gob in abandoned portions of the mine produced a substantial quantity of copper. Mine development during the year comprised 23,846 feet of drifts and 25,055 feet of raises. In addition, 40,350 feet of drift and raises were driven for stoping account. Although every effort was made to operate the property at full capacity, a shortage of labor held mine production down to approximately 90 percent. The 10,000-ton flotation plant and all its necessary facilities, erected for and owned by Defense Plant Corporation and leased to the Castle Dome Copper Co., Inc., were ready for operation June 10, 1943.

Under the lease agreement the Castle Dome Copper Co., Inc., took over the plant and facilities June 10, 1943, and began milling copper ore. During the remainder of the year the plant treated 1,714,205 tons of ore averaging 0.612 percent copper. Net recoveries from treatment of this ore were 546 ounces of gold, 27,601 ounces of silver, and 18,020,066 pounds of copper. The mill is now (March 1944) treating about 11,000 tons of copper ore a day. The ore body has been stripped and mined on benches or levels of 40 feet vertical depth. To the end of 1943, 13 of these benches have been worked of a total vertical depth of 550 feet. On the lowest bench now being operated on the 4,265-foot level, the depth of the bench was increased from 40 to 45 feet to determine whether it would be more economical to operate the electric shovels against a higher face.

The rest of the district output was largely copper ore (13,567 tons) shipped direct to a smelter from the Carlota mine by the Carlota Copper Co. and similar ore (10,787 tons) from the Old Dominion, Superior & Boston, and Van Dyke properties.

GRAHAM COUNTY

Aravaipa district.—The principal output in the Aravaipa district in 1943 was 357 tons of zinc-lead ore from the Aravaipa group shipped by the Athletic Mining Co. to the Shattuck Denn custom mill at Bisbee.

Lone Star district.—Mining in 1943 at the Horseshoe mine near Safford was continuous from May 15 to the end of the year, resulting in the shipment of 1,072 tons of crude copper ore.

GREENLEE COUNTY

Ash Peak district (Duncan).—Lessees operated the Ash Peak mine throughout 1943 and shipped 18,320 tons of siliceous silver fluxing ore to the International smelter at Miami; 220 tons of similar ore from the Hardy mine were shipped to the same smelter.

Copper Mountain district (Morenci).—Mining, milling, and smelting at the Morenci branch of the Phelps Dodge Corporation were continuous throughout the year. The company reported that 9,577,595 tons of copper ore were treated in the 25,000-ton concentrator, and that 74,721 tons of crude copper ore, 6,521 tons of copper precipitates, and 5,443 tons of old Clifton smelter cleanings were shipped direct to the Morenci smelter; the output was much greater than in 1942.

According to the annual report of the Phelps Dodge Corporation for 1943, the Morenci open pit had its first full year of steady operation and became the corporation's largest copper-producing branch. Operations in the pit were carried on at a greatly increased rate, made necessary by the Morenci expansion program. At the close of 1943 the pit had been prepared for a daily production of 45,000 tons of copper ore, which is the designed capacity of the combined Phelps Dodge and Defense Plant Corporation concentrators. A total of 40,756,353 tons of material was moved during the year, comprising 9,652,316 tons of ore and 31,104,037 tons of waste. One new bench was opened, and at the end of the year 16 benches were available for mining. Construction on the extension to the concentrator and to the smelter continued throughout the year; however, the work at the smelter seriously interfered with routine smelting operations. This construction of new plant facilities for the expansion program was nearing completion at the close of the year; the entire new plant was placed in full operation February 14, 1944. The cost of the expansion has been borne by the Defense Plant Corporation.

The rest of the district output was principally crude high-silica oxide-copper ore (1,284 tons) from the Keating mine, operated under lease by the Auto Specialties Manufacturing Co., and crude high-silica gold ore (162 tons) from the Climax (Emma Gomez) property.

Metcalf (Greenlee) district.—The Victory Mining Co., Inc., operated the Parrot (formerly Polaris) property near Clifton in 1943 and shipped 86 tons of gold ore to the smelter at El Paso.

MARICOPA COUNTY

New River (Moors) district.—About 5,000 tons of sulfide copper ore were shipped in 1943 from the Orizaba mine by the Orizaba Mining Co.; the ore averaged 5.10 percent copper.

Osborn district.—A total of 2,454 tons of gold-silver-copper-lead ore was shipped in 1943 from the Belmont-McNeil group 25 miles north of Dixie. This group was operated under lease the first 7 months of the year by Reed & Reed and the last 5 months by the East Vulture Mining Co. The East Vulture Mining Co. also operated the Moon Anchor mine in 1943 and shipped 1,595 tons of lead ore to a smelter and treated 800 tons of similar ore in a flotation mill.

Vulture district.—The principal output in the Vulture district in 1943 was 16,349 tons of old waste-dump gold ore from the Vulture property treated by flotation. The remainder of the district output was largely 288 tons of lead ore produced from the Montezuma mine.

Wickenburg district.—Various operators on an old tailings dump at Wickenburg shipped a total of 1,436 tons of gold material in 1943.

MOHAVE COUNTY

Bentley (Grand Wash) district.—Lessees operated the Grand Gulch mine in 1943 and shipped 27 tons of carbonate ore, averaging 22.14 percent copper, to a smelter.

Cedar Valley district.—Mining and milling operations at the Boriana tungsten mine near Yucca were much reduced in 1943; the 200-ton concentration mill ran 95 hours in January, 75 hours in February, and 56 hours in September and treated a total of 1,314 tons of tungsten-copper ore yielding 30 tons of copper concentrates and some tungsten concentrates. The remainder of the district output was 95 tons of crude copper ore shipped from the Antler mine.

Cottonwood district.—The Copper Giant mine near Hackberry was worked the first 7 months of 1943 by lessees and the last 5 months by the owner (Henry Galbraith); a total of 1,177 tons of gold-copper ore was shipped to the smelter at Clarkdale.

Hacks Canyon district.—Five cars (226 tons) of carbonate copper ore were shipped in 1943 from the Hacks Canyon mine south of Fredonia by the Canyon Copper Co.

Indian Secret (White Hills) district.—About 250 tons of waste-dump ore (silver) from the White Hills property, 45 miles north of Chloride, were cyanided in 1943.

Maynard district.—Lessees operated the Gold King group in 1943 and shipped 34 tons of gold-silver ore to a smelter and treated 28 tons of similar ore by gravity concentration.

Music Mountain district.—About 11 tons of rich gold ore were produced in 1943 from the Saddleback claim near Valentine.

Owens (McCracken and Potts Mountain) district.—The principal output in the Owens district in 1943 was 1,240 tons of gold-copper ore shipped direct to a smelter from the Cleopatra mine by various lessees. The remainder of the district output was largely 92 tons of copper ore from the Iron Clad, Panther Claw, and Stein properties.

Prospect Canyon district.—Carbonate ore (41 tons), averaging 8.78 percent copper and containing a little silver, was shipped in 1943 from the Phillips & Stout property 47 miles northeast of Peach Springs.

San Francisco (Oatman, Goldroad, Katherine, Vivian) district.—During the decade 1933–42, mines in the San Francisco district produced an average of 36,979 ounces of gold a year; in 1941 the output was 42,098 ounces, in 1942 it was 28,570 ounces, and in 1943 it dropped to 2,960 ounces. All the output in 1943 came from the Tyro mine at Katherine, operated by the Gold Standard Mines Corporation; however, the mine and 300-ton Katherine cyanide plant were permanently closed April 15. The Goldroad mine at Goldroad, largest producer of gold in the district from 1937 to 1942, inclusive, was idle in 1943 owing to the Government gold-mine closing order of October 1942.

Wallapai district (Cerbat, Chloride, Mineral Park, Stockton Hill).—The output of the Wallapai district in 1943 comprised 40,824 tons of zinc-lead ore, 2,100 tons of copper ore, 385 tons of lead ore, 323 tons of gold ore, and 92 tons of zinc ore. All the copper ore was carbonate material shipped direct to a smelter from the Emerald Isle mine, and all the zinc ore came from the Columbus mine; the gold ore was produced from two properties—the Flores and Minnesota-Connor; nearly all (376 tons) of the lead ore came from the Samoa mine, operated by lessees; and 94 percent of the zinc-lead ore was produced from the Tennessee mine at Chloride. The Tennessee-Schuylkill Corporation operated the Tennessee mine and its 150-ton flotation mill throughout the year; the mill treated 38,286 tons of ore (averaging 0.04 ounce of gold and 2.01 ounces of silver to the ton, 0.10 percent copper, 3.70 percent lead, and 5.65 percent zinc), which yielded 3,015 tons of lead concentrates and 3,100 tons of zinc concentrates. Other producers of zinc-lead ore were the De La Fountaine, Minnesota-Connor, Silver Hill, Silver Monster, and Summit properties; nearly all the ore from these properties was shipped to a custom mill in Utah.

PIMA COUNTY

Ajo district.—Mining and milling at the New Cornelia property were continuous and at capacity throughout the year; the 25,000-ton concentrator treated 8,956,698 tons of copper ore in 1943 compared with 8,324,033 tons in 1942. The property has ranked first in output of copper in Arizona for the past several years, but in 1943 the Morenci branch of the Phelps Dodge Corporation took first place. According to the annual report of the Phelps Dodge Corporation for 1943, the New Cornelia open pit produced 8,961,111 tons of copper ore and 6,700,804 tons of waste; operations were of a routine nature and followed the schedule made necessary by the increased scale of production.

Amole district.—The Old Yuma mine west of Tucson was operated under lease in 1943 by the Tucson Ore Milling Co.; 353 tons of zinc-lead ore were shipped to a smelter, and 270 tons of similar ore were treated in a concentration mill. The remainder of the district output was 286 tons of copper ore shipped from the Mile Wide mine to the smelter at Hayden.

Arivaca district.—Leasing operations at the Oreona mine during the first 5 months of 1943 produced 70 tons of fairly rich gold ore; 2 ounces of placer gold were recovered from gravel in gulches near Arivaca.

Baboquivari district.—In 1943 various lessees worked at the Papago Chief mine 65 miles southwest of Tucson; a total of 467 tons of gold-silver-copper ore was shipped to the smelter at Hayden.

Empire district.—E. P. Hilton, owner of the Chief mine near Vail, shipped 8 tons of high-grade carbonate zinc-lead ore to the smelter at El Paso in 1943 and 107 tons of high-grade carbonate zinc ore to a zinc smelter at Blackwell, Okla.

Helvetia (Rosemont) district.—The output of the Helvetia district in 1943 comprised 3,388 tons of copper ore shipped direct to a smelter and 145 tons of zinc-lead ore and 106 tons of zinc-copper ore shipped to the Shattuck Denn custom mill at Bisbee. Nearly half of the copper ore came from the Copper World (Leader) mine, worked by various lessees; 1,073 tons of the copper ore and the 106 tons of zinc-copper ore came from the Rosemont mine; and all the zinc-lead ore was produced from the Daylight and Sulphide Lead-Zinc properties. Other producers of copper ore included the Coconino, Graveyard, Last Chance No. 2, Mohawk, and Newman mines.

Meyer (Gunsight) district.—Lessees operated the Gunsight mine a short time in 1943 and shipped 52 tons of low-grade silver-lead ore to a smelter.

Old Hat district (Oracle).—The Daily and Geeseman groups and the 100-ton flotation mill on the property were purchased June 26, 1943, by the Control Mines Co. from Control Mines, Inc. A total of 11,676 tons of copper ore was treated by flotation during the year from operations of both companies. The remainder of the district output was 142 tons of high-grade copper ore shipped direct to a smelter from the Giant claim.

Pima (Sierritas, Papago, Twin Buttes) district.—One of the most important mining events in Arizona in 1943 was the initiation in September of milling at the San Xavier mine 20 miles southwest of Tucson by the Eagle-Picher Mining & Smelting Co. The company reported that during the last quarter of the year the new 150-ton flotation mill treated 14,057 tons of ore (averaging 3.09 ounces of silver to the ton, 0.50 percent copper, 4.94 percent lead, and 11.02 percent zinc), which yielded 964 tons of lead-copper concentrates and 2,176 tons of zinc concentrates. The remainder of the district output was mainly 2,578 tons of zinc ore and zinc-lead ore from the San Xavier Extension mine and waste dump shipped to custom mills in Arizona and New Mexico by the Chilson Mines Co. and 338 tons of zinc-lead ore from the Esperanza, High Hill, and Olivette properties.

Roskruge and Waterman (Silver Hill) district.—A. R. Byrd, Jr., leased the Silver Hill mine early in 1943 and during the year shipped

979 tons of copper ore and 180 tons of lead-copper ore to smelters in Arizona and Texas.

Silver Bell district.—Lessees worked at the Indiana-Arizona Copper Co. property in 1943 and shipped 663 tons of low-grade silver-lead ore to the smelter at El Paso.

PINAL COUNTY

Bunker Hill district (*Copper Creek*).—All the output in the Bunker Hill district in 1943 was crude copper ore (865 tons) shipped to a smelter; 793 tons were produced from the Magma Chief mine and 72 tons from the Mammoth Butte mine.

Martinez Canyon district.—Development throughout the year at the Silver Bell-Martinez group by the California Steel Products Co. resulted in the shipment of 7 cars (404 tons) of crude lead ore.

Mineral Creek district (*Ray*).—Mining operations at the Ray mine of the Nevada Consolidated Copper Corporation (subsidiary of the Kennecott Copper Corporation) were at a lower rate in 1943 than in 1942, resulting in a decrease in output of copper ore from 2,969,268 to 2,351,900 tons. The company 12,000-ton concentrator at Hayden operated continuously and treated 2,343,204 tons of ore averaging 1.589 percent copper. In addition, 8,696 tons of crude copper ore and 7,071 tons of copper precipitates were shipped direct to the smelter at Hayden. According to the annual report of the Kennecott Copper Corporation for 1943, a shortage of underground labor of all classes adversely affected mine operations at the Ray property, although copper production was maintained at a level well above its pre-war rate of output. Sufficient development was done to keep pace with ore production.

The remaining district output was 1,360 tons of copper ore produced from an open pit at the Copper Butte property.

Mineral Hill district.—The output of the Mineral Hill district in 1943 comprised 12 tons of copper ore from the Blue Crystal claim, 11 tons of high-grade lead ore from the Orphan Boy claim, and 75 tons of gold ore from waste dumps of the Sunset and Wedge properties.

Old Hat district (*Oracle*).—Virtually all the output in the Old Hat district (Pinal County) in 1943 was 83,986 tons of oxide gold-silver-lead-molybdenum-vanadium ore and 48,411 tons of sulfide zinc-lead ore produced from the Mammoth-Collins and New Year-Mohawk groups by Mammoth-St. Anthony, Limited. The output of oxide ore was much less than in 1942, but the output of sulfide ore was much greater. The company reported that the oxide ore was treated by gravity concentration, followed by flotation (flotation tailings were treated by cyanidation), and that the sulfide ore was treated by straight flotation. The oxide lead concentrates (1,995 tons) were smelted in the company 20-ton lead furnace, and the sulfide lead concentrates (3,948 tons) and the sulfide zinc concentrates (6,481 tons) along with some high-grade gold-iron concentrates (117 tons) were shipped to smelters in Texas. Gold precipitates, as well as molybdenum and vanadium products and lead bullion, were shipped East.

Pioneer district (*Superior*).—Mining, milling, and smelting at the Magma property of the Magma Copper Co. were continuous throughout the year, except for brief shut-downs to allow for repairs. The output of gold, silver, copper, and lead was less than in 1942, but the output of zinc was slightly greater. The company reported that 269,210 tons of copper ore and 84,571 tons of zinc-copper ore were treated in the 850-ton concentrator, and 60,402 tons of copper ore along with 94,619 tons of copper concentrates recovered from copper ore and 10,269 tons of copper concentrates recovered from zinc-copper ore were sent to the company 450-ton smelter. The zinc concentrates (9,084 tons) were shipped to Amarillo, Tex. The property was the largest producer of zinc in the State in 1943.

According to the company printed annual report, the average net cost of producing copper after deduction of gold, silver, and zinc concentrate values was 10.28 cents a pound in 1943 compared with 9.66 cents in 1942. Development in 1943 comprised 4,458 feet of drifting, 6,818 feet of raising, 278 feet of sinking, and 3,246 feet of cross cutting. It was necessary to drastically curtail the usual amount of development early in the year, owing to shortage of labor. Beginning with the latter part of March, production decreased slowly until in October the tonnage mined reached a lower point than for any full month's operation since November 1938. The drop in production was due principally to the continued loss of skilled employees to the higher wage-paying war industries, inability to obtain sufficient replacements, and the inexperience and, in many cases, inefficiency of the replacements procured. Gold and silver values in the copper ore continue to decrease as more ore is mined from the lower levels. Also, operating conditions are becoming increasingly difficult owing to heavier ground and higher rock temperatures on the lower levels.

The remainder of the district output was mainly 2,960 tons of siliceous silver ore from the Reymert mine shipped by Reymert Lease to the International smelter at Miami.

Summit district.—Copper ore (159 tons) was produced in 1943 from two mines west of Miami in the Summit district; 114 tons came from the Copper Flat mine and 45 tons from American Mines.

Vekol district.—The output in the Vekol district in 1943 was 215 tons of lead ore produced from the Hilltop mine, 45 miles southwest of Casa Grande.

SANTA CRUZ COUNTY

Harshaw district.—The principal output in the Harshaw district in 1943 was 60,814 tons of zinc-lead-silver ore produced from the Trench and Flux groups by the American Smelting & Refining Co.; however, the output was 21 percent less than in 1942 and the ore was of lower grade. It was treated by flotation in the company 200-ton mill and yielded 5,290 tons of lead-silver concentrates and 6,775 tons of zinc concentrates. The rest of the district output comprised 258 tons of silver-lead ore from the Hardshell mine, 93 tons of zinc-lead ore from the Blue Nose Extension mine, and 87 tons of silver ore from the American and Salvador properties.

Oro Blanco district (Ruby).—The output in the Oro Blanco district in 1943 was 861 tons of siliceous silver ore shipped from the Brick claim to smelters in Arizona.

Patagonia (Duquesne) district.—The Duquesne property of the Callahan Zinc-Lead Co. continued in 1943 to be a large producer of zinc-lead-copper ore, and during the year 26,739 tons of ore from this mine were treated in the company 140-ton flotation mill. In addition, the mill treated 4,255 tons of custom ore from two properties in the district—4,206 tons of zinc-copper ore from the Pride of the West mine and 49 tons of copper ore from the Santo Nino mine. The total output from the mill was 1,213 tons of copper concentrates, 713 tons of lead-copper-silver concentrates, and 4,086 tons of zinc concentrates. The remainder of the district output was chiefly 1,267 tons of silver-lead ore shipped by lessees from the Mowry mine and waste dump to the smelter at El Paso.

Tyndall district.—Lessees worked at four mines in the Tyndall district in 1943 and shipped a total of 519 tons of ore; 492 tons of it was silver-lead ore from the Alto, Jefferson, and San Ramon properties.

YAVAPAI COUNTY

Agua Fria district.—Mining operations at the Binghampton mine 6 miles east of Mayer produced 6,231 tons of copper ore in 1943, which was shipped direct to a smelter. Copper ore was shipped also from the Burzog (Old Minor), Burlington, Stoddard, and Yaller Kid properties.

Big Bug district.—The Iron King mine at Humboldt, operated by the Shattuck Denn Mining Corporation, continued in 1943 to be a large producer of zinc-lead ore. During the first 6 months of the year about 35,650 tons of ore were treated by concentration, and the current gold-silver flotation tailings (26,735 tons) were treated by cyanidation; the cyanidation of tailings ceased in June, but during the last 6 months of the year 33,348 tons of zinc-lead ore were treated by straight concentration. In addition, 4,495 tons of crude gold ore were shipped direct to a smelter. The 240-ton flotation mill on the property treated a total of 75,366 tons of zinc-lead ore (including 6,368 tons of custom ores) in 1943, which yielded 3,922 tons of lead concentrates, 7,139 tons of zinc concentrates, and 5,795 tons of iron concentrates. Liberty Mines operated the Hackberry mine near Mayer throughout the year and shipped 5,742 tons of zinc-lead ore to the Iron King custom mill. The remainder of the district lode output was largely 2,500 tons of old copper tailings from the Humboldt tailing dump treated by concentration. The only placer output in the district was 78 ounces of gold and 7 ounces of silver recovered by sluicing at the Standard claim.

Black Canyon district.—The output in the Black Canyon district in 1943 was nearly all gold-silver ore (74 tons) from the Golden Turkey mine and silver ore (24 tons) from the Christmas and Thunderbolt properties.

Black Hills district.—A lessee operated the Shylock mine near Dewey in 1943 and shipped 109 tons of siliceous silver-copper ore to the smelter at Clarkdale.

Black Rock district.—Virtually all the output in the Black Rock district in 1943 was 122 tons of gold-copper ore produced from the Unida mine, 10 miles north of Wickenburg.

Blue Tank district.—Leasing operations at the Camp B mine near Wickenburg during 5 months of 1943 produced 743 tons of copper ore. Placer operators recovered 3 ounces of gold from claims along the Hassayampa River.

Bullard (Pierce) district.—Mining operations at the Bullard mine near Aguila began October 1, 1943, under a Reconstruction Finance

Corporation loan; during the last 2 months of the year 700 tons of gold-copper ore were shipped to the smelter at Hayden. Gold-copper ore (28 tons) was produced also from the Amazon claim.

Cherry Creek district.—A lessee operated the Bugler mine a short time in 1943 and shipped 64 tons of gold ore to the smelter at Clarkdale.

Copper Basin district.—The output in the Copper Basin district in 1943 comprised 11,463 tons of low-grade copper ore shipped direct to a smelter from the Commercial mine and 100 tons of zinc ore from the Boston-Arizona mine and 71 tons of zinc-lead ore from the Black Diamond, Silver Gulch, and U. S. Navy properties treated in the Iron King custom mill at Humboldt.

Eureka district.—Copper output in the Eureka district was much greater in 1943 than in 1942, owing to the completion in February of the new 2,500-ton flotation mill at the Bagdad mine. The old 250-ton mill continued operating until March 8, when the new mill began running; during the year a total of 375,715 tons of ore, averaging 1.26 percent copper, was mined and treated. The Bagdad Copper Corporation estimates that it has 6,000,000 tons of ore reserves and an additional 5,000,000 tons of indicated ore. The rest of the district output was mainly 374 tons of copper ore and 110 tons of zinc-lead ore from the Copper King mine and 210 tons of copper ore from the Copper Queen and Old Dick properties.

Hassayampa (*Groom Creek*, *Hassayampa River*, *Senator*, *Prescott*) *district.*—The principal output in the Hassayampa district in 1943 was 90 tons of copper ore from the Storm Cloud and Treadwell properties and 37 tons of gold ore from the Easy-to-Get claim.

Martinez (*Congress*) *district.*—Lessees worked at two properties in the Martinez district in 1943 and shipped a total of 1,142 tons of highly siliceous gold ore to the smelter at Hayden; 658 tons came from the Congress mine and 484 tons from the Niagara-Congress waste dump.

Pine Grove district (*Crown King*).—Zinc-lead-gold ore from the Gladiator-War Eagle group continued in 1943 to be the principal output in the Pine Grove district. About 4,800 tons of ore were treated in a 50-ton flotation mill and yielded 178 tons of high-grade lead-silver-gold concentrates, 94 tons of lead-copper concentrates, and 334 tons of zinc concentrates. The remainder of the district output was 45 tons of lead ore shipped direct to a smelter from the Del Pasco mine.

Pocket Creek district.—The Pocket Creek Placer was operated during the spring months of 1943, and 179 ounces of gold and 7 ounces of silver were recovered by sluicing.

Tiger district.—The output in the Tiger district in 1943 was 464 tons of zinc-lead ore from the Tiger mine treated by flotation and 116 tons of gold ore shipped direct to a smelter from the Pilgrim claim near Crown King.

Verde district (*Jerome*).—Mining, milling, and smelting were continuous throughout 1943 at the United Verde branch of the Phelps Dodge Corporation; however, the output of ore and old tailings decreased to 879,170 tons from 1,212,248 tons in 1942. A total of 613,681 tons of copper ore was treated in the 2,100-ton concentrator, and 265,489 tons of ore and old tailings and 354 tons of copper precipitates were shipped direct to the corporation smelter at Clarkdale.

According to the printed annual report of the corporation for 1943, mining at the United Verde mine was confined to the areas between the 1,650 and 3,300 levels (all copper areas above the 1,650 level have been abandoned), from which 749,619 tons of primary copper ore were produced compared with 1,015,202 tons in 1942. Approximately half of the 1943 output was low-grade ore not economic at a 12-cent copper price, but it was possible to mine this ore under a revised quota established October 1, 1942, under the premium-price plan. Exploration and development on the lower levels of the mine were prosecuted vigorously. A total of 66,678 feet of exploratory and development openings was driven, including 10,008 feet of drifting, 2,337 feet of raising, 642 feet of calyx drilling, and 53,691 feet of diamond drilling. Although all objectives have not been reached, no new ore was discovered as a result of the current deep-level exploration campaign.

The remainder of the district output was 14,992 tons of siliceous gold-silver ore from the Iron King-Equator group, shipped by lessees to the smelter at Clarkdale, and 4,537 tons of copper ore shipped to a smelter from the Dundee-Arizona, Florentis, and Verde properties.

Walker district.—Lessees worked at eight properties in the Walker district in 1943 and shipped 1,027 tons of ore and old slag; the total included 381 tons of zinc-lead ore from the New Strike mine, shipped to the Iron King custom mill at Humboldt, and 290 tons of old silver-lead slag from the Porter slag dump and 263 tons of high-grade gold-lead ore from the Champion, Emma, and Oro Plata properties, shipped direct to a smelter. Placer gold (5 ounces) was recovered from two claims on Lynx Creek near Walker.

Weaver district (Octave).—Gold production in the Weaver district decreased considerably in 1943, owing to the closing in 1942 of three large producers of gold ore—the Octave, Alvarado, and Yarnell properties. The lode output of the district comprised 435 tons of siliceous gold ore shipped direct to a smelter from the Monica mine and 422 tons of old mill cleanings and old tailings (containing chiefly gold) shipped by lessees from various mill sites; 19 ounces of placer gold were recovered from various claims along Weaver Creek and at Rich Hill.

White Picacho district.—Lessees worked the Diamond Joe mine near Wickenburg for a few months in 1943 and shipped 213 tons of silver-lead ore to the smelter at El Paso; 8 tons of gold-copper ore were produced from the Robertson claim.

YUMA COUNTY

Castle Dome district.—The output of silver and lead in the Castle Dome district was much greater in 1943 than in 1942, owing to a full year's operation at the DeLuce group by the Arizona Lead Co. The mill on the property, equipped with jigs and tables, treated 26,991 tons of oxidized lead ore; in addition, 62 tons of high-grade oxidized lead ore were shipped direct to a smelter. The remainder of the district output was small lots of similar ore produced from the Sonora and Union properties.

Cienega district.—Strategic Metal Mines operated the Empire-Arizona property, 12 miles east of Parker, throughout 1943 and shipped 774 tons of gold-copper ore to the smelter at Clarkdale. The rest of the district output was mainly 286 tons of gold-copper ore from the Billy Mack and Lion Hill properties.

Ellsworth district (*Salome*).—In 1943 about 3,500 tons of old tailings (gold) from the Bonanza & Golden Eagle dump were treated by cyanide leaching. The remainder of the district output was largely 227 tons of copper ore shipped from the Columbia and Yuma Copper properties and 105 tons of gold ore from the Bunker Hill and Odin mines.

Plomosa district.—The R. & A. Mines Co. operated (under lease) the R. & A. mine near Vicksburg in 1943 and shipped 976 tons of siliceous silver ore to the International smelter at Miami. The rest of the district lode output included 108 tons of siliceous gold ore shipped from the Little Butte mine and 108 tons of copper ore produced from the Apache and Moore properties. The Sax placer claim was operated for a short time in 1943, and 4 ounces of gold were recovered by drift mining.

Santa Maria (*Planet, Bill Williams*) *district.*—The only output in the Santa Maria district in 1943 was 334 tons of copper ore shipped direct to a smelter from the Swansea mine, operated under lease by the Swansea Development Co.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN CALIFORNIA

(MINE REPORT)

By Charles White Merrill

SUMMARY OUTLINE

Calculation of value of metal production	266	Ore classification	275
Mine production by counties	272	Metallurgic industry	275
		Review by counties and districts	280

SUMMARY

California gold production in 1943 fell below that in any year since 1848—the year James A. Marshall made his historic discovery in the gravels of the American River near Coloma. Except for 1932 and 1933, silver production was the lowest in the twentieth century. However, copper production was the largest in both quantity and value since 1930; zinc was the largest in quantity and value since 1927; and lead was the largest in quantity and value since 1918. The total value of the five metals ($9,176,616) was the lowest since 1848. Higher wages, enlistment of miners in the armed forces, migration of miners to war industries, rising prices of supplies and equipment and difficulties in obtaining them, increased taxes, and the fixed prices for gold and silver were factors accelerating the downward trend, which was already under way in 1942. In addition, 1943 was the first year in which War Production Board Limitation Order L–208 affected operations for the whole year. During 1943, however, 38 grants were issued by the Board to California gold miners, which resulted in expanded production in some instances.

Comparing 1943 with 1942, gold decreased 83 percent and silver 58 percent in both quantity and value; copper increased 728 percent in quantity and 790 percent in value; lead increased 13 percent in quantity and 26 percent in value; and zinc increased 203 percent in quantity and 252 percent in value. The total value of the five metals was 71 percent less than in 1942; of the total value gold represented 57 percent, silver 5 percent, copper 25 percent, lead 9 percent, and zinc 4 percent.

The counties of the State, arranged by value of output of the five metals, were in very different order in 1943 from preceding years. Inyo County, which ranked seventh in 1942, was at the top of the list in 1943. Lead represented over half of the total value of metal output in Inyo County, and the value of each of the other four metals was also substantial. Siskiyou County, eighth on the list in 1942, advanced to second place in 1943; copper production at the Dakin (Gray Eagle) mine near Happy Camp was the principal factor in the county increase. Yuba County remained in third place, largely as the result of continued operation of some of its connected-bucket gold dredges.

Other counties of the leading 10, listed in order of total value of output, were: Nevada County (largely from gold ore including mill clean-ups), Calaveras County (largely from copper and gold-copper-zinc ores), Butte County (largely from connected-bucket dredges and from zinc ore), Sacramento County (almost entirely from connected-bucket dredging), Tuolumne County (largely from Eagle Shawmut mine gold ore), Shasta County (largely from copper-zinc ore), and Stanislaus County (almost entirely from connected-bucket gold dredging). Of the 28 counties producing, these 10 furnished over seven-eighths of the total value of the five metals produced in the State during the year.

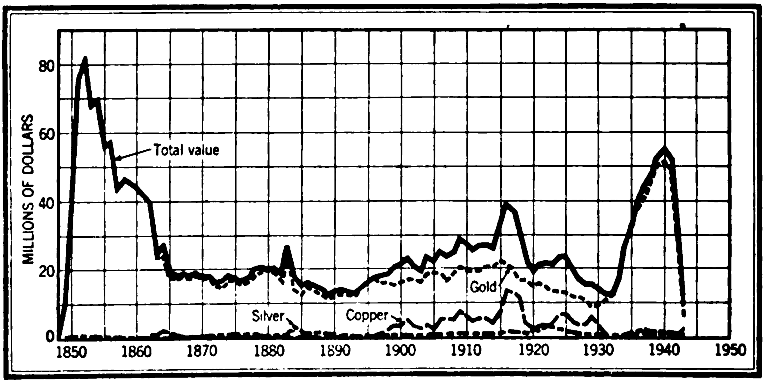

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in California, 1848–1943. The value of lead and zinc has exceeded $1,000,000 in only a few years.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942-43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in California, 1939–43, and total, 1848–1943, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	1,028	749	5,577,853	1,435,264	$50,234,240	2,599,139	$1,764,264
1940	1,030	836	4,669,433	1,455,671	50,948,485	2,359,776	1,678,063

[1] For historic data by years see Minerals Yearbook, Review of 1940, p. 219.

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property worked.

[3] First year for which this method was reported used in California.

[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold which are included under "Small-scale hand methods."

[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.

[7] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

[8] Complete data not available.

Gold.—An uninterrupted rise beginning in 1929 culminated in the production of $50,948,485 in gold in 1940, the largest value since 1856. In 1941, however, a reaction set in which gained headway in 1942. By January 1943 monthly production had sunk to 16,425 ounces, and thereafter it fluctuated between that figure and a low of 8,547 ounces established in February. The year ended with an output of 9,824 ounces in December, second-lowest month of the year. Compared with 1942 the decrease of 699,669 ounces ($24,488,415) recorded in 1943 was greater in both quantity and value than that between any other 2 years in the State's history, not excluding 1852–53, 1854–55, and 1856–57, when flush placer output was failing; 1883–84, when the Sawyer Decision drastically reduced hydraulicking; and 1917–18, when World War I caused many operations to suspend or curtail output.

Mine production of gold in California, 1937–43, by months, in fine ounces, in terms of recovered metal

Month	1937	1938	1939	1940	1941	1942	1943
January	83,964	96,469	106,362	128,127	129,894	101,698	16,425

December	107,290	129,656	127,310	149,718	105,198	20,159	9,824
Total	1,174,578	1,311,129	1,435,264	1,455,671	1,408,793	847,997	148,328

A study of the monthly production figures since January 1937 brings out some points that are obscure in the annual figures. The uninterrupted upward trend shown in the annual figures beginning in 1929 and culminating in 1940 is paralleled in the available monthly data. It will be noted, however, that a serious recession was experienced in July 1940 from which the industry did not fully recover until November. This was caused by a labor strike at the Selby smelter and refinery of the American Smelting & Refining Co., which resulted in the postponement of many shipments of ore, concentrates, and bullion; the strike was called July 1, and work was resumed November 9. The peak reached in December 1940 may be attributed, at least in part, to the movement of material accumulated during the strike. Beginning with January 1941, however, the trend is unmistakably downward, and the rate of decline accelerates as the months pass. The downward plunge is arrested in October 1942 probably because many operations, closed by War Production Board Order L-208, made final clean-ups, which were shipped before the end of

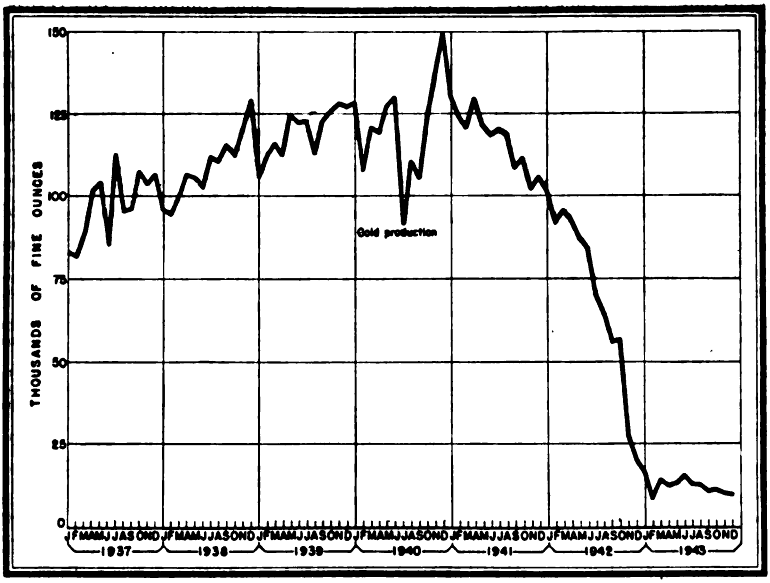

FIGURE 2.—Mine production of gold in California, 1937–43, by months, in terms of recovered gold.

the month. At any rate, the decline in November and December put the curve back on the precipitous trend line shown during the few months preceding October. By January production had reached a level that permitted but little further recession.

The 25 leading gold-producing mines in California in 1943, listed in the following table, yielded 92 percent of the total gold output of the State; the leading 5 mines produced 57 percent and the leading 10 mines 73 percent. Many changes have taken place in the list since 1942; only 9 of the mines listed in 1942 are on the 1943 list.

Twenty-five leading gold-producing mines in California in 1943, in order of output

Rank	Mine	District	County	Rank in 1942	Operator	Source of gold
1	Yuba Unit	Yuba River	Yuba	2	Yuba Consolidated Gold Fields.	Dredge.
2	Natomas Co.	Folsom	Sacramento	1	Natomas Co.	Do.
3	Lava Cap	Grass Valley-Nevada City.	Nevada	5	Lava Cap Gold Mining Corporation.	Gold ore.
4	Feather River channel.	Oroville	Butte	26	Golden Feather Dredging Co.	Dragline.
5	Eagle Shawmut	Mother Lode	Tuolumne	11	Miller & Clemson	Gold ore.
6	Empire Star mines.	Grass Valley-Nevada City.	Nevada	4	Empire Star Mines Co., Ltd., and New Verde Mines Corporation.	Do.
7	Tuolumne gold dredge.	La Grange	Stanislaus	37	Tuolumne Gold Dredging Corporation.	Dredge.
8	Upper Comanche dredge.	Camanche	San Joaquin	59	Gold Hill Dredging Co.	Do.
9	Original Sixteen to One.	Alleghany	Sierra	14	Original Sixteen to One Mine, Inc.	Gold ore.
10	Columbia No. 2	Resting Springs	Inyo	42	Shoshone Mines, Inc.	Lead ore.
11	Oroville dredge	Oroville	Butte	34	Oroville Gold Dredging Co.	Dredge.
12	Placer Properties	Knights Ferry	Stanislaus	15	Placer Properties Co.	Dragline.
13	Pine Tree and Josephine.	Mother Lode	Mariposa	28	Pacific Mining Co.	Gold ore.
14	Dakin (Gray Eagle).	Klamath River	Siskiyou	[1]	Gray Eagle Copper Co.	Copper ore.
15	Mount Gaines	Hunter Valley	Mariposa	23	Mount Gaines Mining Co.	Gold ore.
16	Plymouth Tailings.	Mother Lode	Amador	55	Argonaut Mining Co., Ltd.	Do.
17	Bagdad-Chase	Buckeye	San Bernardino.	31	Frank Royer	Do.
18	Quail Hill	West Belt	Calaveras	[1]	G. Ivan Smith	Zinc ore and zinc-copper ore.
19	Kutras tract	Redding	Shasta	65	Columbia Construction Co., Inc.	Nonfloat.
20	Cactus Queen	Mojave	Kern	9	Cactus Mines Co.	Gold ore.
21	Lower Comanche dredge.	Camanche	San Joaquin	38	Gold Hill Dredging Co.	Dredge.
22	Tungold	Randsburg	Kern	383	Rand Gold Dredging Associates.	Do.
23	Feliciana	Mother Lode	Mariposa	79	Russell Wilson	Gold ore.
24	Relief Hill	North Bloomfield	Nevada	119	Western Gold, Inc.	Hydraulic.
25	Red Hill	Junction City	Trinity	173	Goldfield Consolidated Mines Co.	Do.

[1] Not operated in 1942.

Silver.—Most of the silver output in California in 1943 was more localized than that of the gold; the 10 leading silver-producing mines listed in the following table yielded 89 percent of the State total recoverable silver in that year, and the 4 leading mines yielded 70 percent. All 10 leading mines derived their silver from ore other than straight silver, and most of them depended on argentiferous base-metal ores.

Copper.—Copper production in California in 1943 was the largest in both quantity and value since 1930. Most of the copper came from mines brought into production during the year. The following

Ten leading silver-producing mines in California in 1943, in order of output

Rank	Mine	District	County	Rank in 1942	Operator	Source of silver
1	Columbia No. 2	Resting Springs	Inyo	3	Shoshone Mines, Inc.	Lead ore.
2	Darwin group	Coso	do	6	Darwin Mines (Arthur J. Theis, trustee).	Do.
3	Lava Cap	Grass Valley-Nevada City.	Nevada	2	Lava Cap Gold Mining Corporation.	Gold ore.
4	Pine Creek	Bishop Creek	Inyo	5	United States Vanadium Corporation.	Tungsten-molybdenum ore.
5	Hornet	Flat Creek	Shasta	118	The Mountain Copper Co., Ltd.	Copper ore.
6	Last Chance	Coso	Inyo	(1)	L. D. Foreman	Lead ore.
7	Quail Hill	West Belt	Calaveras	(1)	G. Ivan Smith	Zinc ore and zinc-copper ore.
8	Gold Bottom	Slate Range	Inyo	(1)	Damon & Damon	Gold-silver ore and zinc ore.
9	Dakin (Gray Eagle).	Klamath River	Siskiyou	(1)	Gray Eagle Copper Co.	Copper ore.
10	Cactus Queen	Mojave	Kern	1	Cactus Mines Co.	Gold ore.

[1] Not operated in 1942.

seven companies, listed in order of copper production (each producing more than 100,000 pounds), supplied 98 percent of the State total and the first three 87 percent: Gray Eagle Copper Co. (Dakin mine, Klamath River district, Siskiyou County); Keystone Copper Co. (Keystone mine, Copperopolis district, Calaveras County); The Mountain Copper Co., Ltd. (Hornet mine, Flat Creek district, Shasta County); United States Vanadium Corporation (Pine Creek mine, Bishop Creek district, Inyo County); Winston Copper Co. (Newton mine, Ione district, Amador County); G. Ivan Smith (Quail Hill mine, West Belt district, Calaveras County); and Hoefling Bros. (Big Bend mine, Yankee Hill district, Butte County).

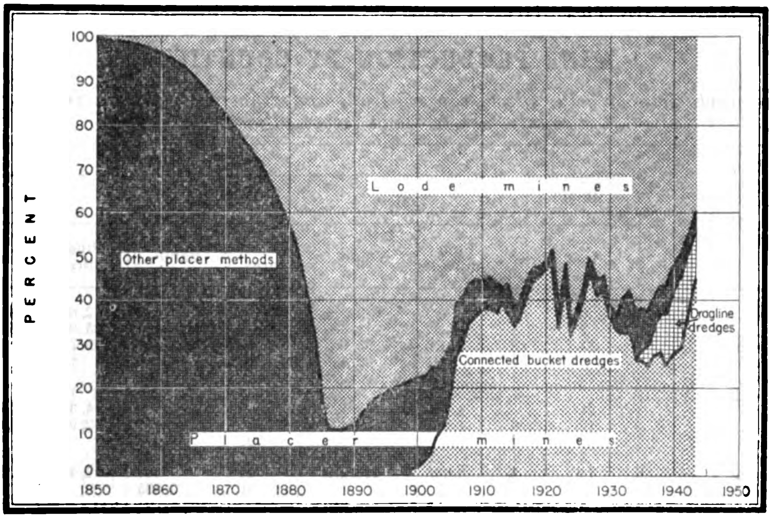

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various methods of placer mining, 1850–1943.

Lead.—Lead production in California in 1943 was the largest in both quantity and value since 1918. The two leading producers accounted for well over three-fourths of the State output in 1943, as in 1942. The following seven companies, listed in order of lead production (each producing over 100,000 pounds), furnished 97 percent of the State total: Shoshone Mines, Inc. (Columbia No. 2 mine, Resting Springs district, Inyo County); Darwin Mines (Essex and Independence mines, Coso district, Inyo County); L. D. Foreman (Last Chance slag dump, Coso district, Inyo County); Damon & Damon (Gold Bottom mine, Slate Range district, Inyo County); L. D. Foreman (Lane Slag dump, Coso district, Inyo County); C. O. Mittendorf (Ophir mine, Slate Range district, Inyo County); and Southwest Lead & Zinc Co. (Honolulu-Big Horn mine, South Park district, Inyo County).

Zinc.—Zinc production in California in 1943 was the largest in both quantity and value since 1927. Most of the output came from mines brought into production during the year. The following eight companies, listed in order of zinc output (each producing over 100,000 pounds), contributed 99 percent of the State total: G. Ivan Smith (Quail Hill mine, West Belt district, Calaveras County); Hoefling Bros. (Big Ben mine, Yankee Hill district, Butte County); Darwin Mines (Essex and Independence mines, Coso district, Inyo County); The Mountain Copper Co., Ltd. (Hornet mine, Flat Creek district, Shasta County); E. A. Vogt (Collier mine, West Belt district, Calaveras County); E. H. Snyder (Colorado group, Modoc district, Inyo County); Southwest Lead & Zinc Co., (Honolulu-Big Horn mine, South Park district, Inyo County); and Damon & Damon (Gold Bottom mine, Slate Range district, Inyo County).

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Output from property not classed as a "mine."

MINING INDUSTRY

The tonnage of material from lode mines in California treated in 1943 decreased 65 percent compared with 1942, and the yardage at placer mines decreased 84 percent; the output of lode gold declined 85 percent and that of placer gold 81 percent. The increased production of base-metal ore accounts for the smaller decline in ore tonnage than in lode-gold production. The average recoverable gold content of gravels increased 18 percent. Of the State total gold output in 1943, 40 percent came from lode mines and 60 percent from placers; this represents the highest placer : lode ratio since 1900, when separate annual data were first compiled, and almost certainly the highest since large-scale hydraulicking was terminated by the Sawyer Decision of 1884.

Dredges of the connected-bucket type washed about 80 percent of the total gravel mined in 1943 in the State and recovered 75 percent of the total placer gold; the value of gold produced by connected-bucket dredges was the smallest since 1904 and its quantity the smallest since 1902. Dragline dredges washed 14 percent of the gravel mined and recovered 16 percent of the placer gold, the lowest point reached by dragline dredging in either yardage washed or gold recovered since 1934—the second year in which the method was used in California. Of the three dragline dredges active in 1943 one had two dragline excavators with 2½- and 6-cubic yard buckets, respectively; one had a dragline excavator with a 5-cubic yard bucket; and one was an experimental one-man outfit which used a gasoline-driven excavator with a ½-cubic yard bucket.

All other placer-mining methods also showed decreases in both quantity of gravel washed and gold recovered. No Becker-Hopkins or suction dredges were reported in production during 1943. Nonfloating washing plants to which gravel was delivered by mechanical means (dragline excavators, power shovels, slackline excavators, trucks, bulldozers) treated much less gravel than in 1942. Many of these operators found that their equipment could be employed more profitably on war contracts; competition for labor skilled in operating earth-moving machines was very keen.

Hydraulic mining at established mines found itself singularly free from shortages of materials and power, but labor conditions caused marked reductions in operations. Very few hydraulic mines reopened for the 1943–44 season. Gold production from small-scale hand methods was sharply curtailed. In normal times a large number of such operations are carried on independently by marginal workers, but the increasing labor shortage in California in 1943 caused many small-scale hand miners to abandon the streams and dry diggings for employment at wages. Drift mining, once very productive in California, also declined owing to war conditions. The average grade of gravel washed at drift mines was the highest recorded in the 23 years that such data have been compiled. This high figure of $7.54 per cubic yard probably represents the average grade of material that can be washed profitably, whereas the lower figures of earlier years include much unprofitable gravel washed during exploratory campaigns.

Consumption of quicksilver at California placer mines totaled 2,026 pounds in 1943 compared with 13,944 pounds in 1942. The following quantities of gold were recovered to the pound of quicksilver used in 1943 (1942 figures in parentheses): Connected-bucket dredging, 40 ounces (34); dragline dredging, 49 ounces (40); nonfloating washing plants with mechanical gravel handling, 49 ounces (17); hydraulicking, 11 ounces (16); and small-scale hand operation, 23 ounces (18).

ORE CLASSIFICATION

Of the 739,956 tons of ore (including 158,770 tons of old tailings) sold or treated in 1943, 55 percent was dry gold, 36 percent copper, 7 percent lead, 1 percent zinc, and the remainder zinc-copper, dry gold-silver, zinc-lead, and dry silver. Substantial quantities of copper and silver and some gold and lead were recovered from ore valued chiefly for tungsten and molybdenum; this ore is not included in tonnage figures, but the metals are included in the metal totals.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

[1] Includes 65,000 pounds from precipitates.
[2] Excludes tungsten ore.
[3] Includes metal recovered from tungsten ore.
[4] Includes ore valued principally for tungsten and molybdenum.
[5] Includes 71,100 pounds from precipitates.

METALLURGIC INDUSTRY

During 1943, 54 percent of the total ore and old tailings handled was treated at amalgamation and cyanidation mills (with or without concentrating equipment); most of the remainder was treated at concentrating mills; and only 65,608 tons of crude ore and old tailings were shipped for direct smelting. Smelters also received 52,495 tons of flotation concentrates and 219 tons of gravity concentrates from California mine operators. Comparing 1943 with 1942, material treated at cyanidation mills decreased 80 percent, and the quantity of crude ore and old tailings smelted increased 9 percent; the quantities of ore concentrated in 1942 and 1943 are not comparable because a substantial tonnage of tungsten ore was included in 1942 but excluded in 1943. The quantity of ore (other than tungsten ore) concentrated in 1943 was five times that in 1942.

Because of the unusual conditions in the California gold industry in 1943, quicksilver- and cyanide-consumption data at mills were not representative of the industry. Only 50 pounds of quicksilver and 21,800 pounds of 91-percent sodium cyanide were reported consumed at amalgamation and cyanidation mills.

The Selby lead smelter of the American Smelting & Refining Co. was the only custom plant that treated gold, silver, copper, lead, or zinc ores in California in 1943. Some ore and concentrates were shipped to out-of-State smelters. Most of the ore produced in the State, however, was treated in company-owned metallurgical plants at the mines. Mills put into production during 1943 included: A 700-ton flotation mill built by the Gray Eagle Copper Co., at the Dakin mine, Klamath River district, Siskiyou County; a 300-ton flotation mill built by The Mountain Copper Co., Ltd., at the Hornet mine, Flat Creek district, Shasta County; and a 1,200-ton flotation plant built by the Pacific Mining Co. at the Union old tailings pond, Copperopolis district, Calaveras County. During the year Hoefling Bros. converted the Surcease gold mill, Yankee Hill district, Butte County, to a flotation mill to treat zinc ore from the Big Bend mine; Red Cloud Mines, Inc., converted the Mount Gaines gold mill, Hunter Valley district, Mariposa County, to a flotation mill to treat zinc ore from the Blue Moon mine; and Eagle Shawmut Mine set up a flotation circuit in the Eagle Shawmut gold mill, Mother Lode district, Tuolumne County, to treat copper-zinc ore from the Penn mine, Campo Seco district, Calaveras County.

Mine production of metals in California in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Ore and old tailings amalgamated	199,088	12,145	3,956			
Ore and old tailings cyanided	202,429	8,039	16,390

---

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 14 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 603,083 ounces from lode mines and 5,992 ounces from placers.

[4] Camanche district lies in Amador and San Joaquin Counties.

[5] East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[6] Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[7] Output from property not classed as a "mine."

[8] West Belt district lies in Calaveras and Eldorado Counties.

[9] Randsburg district lies in Kern and San Bernardino Counties.

[10] Includes 11,700 pounds from precipitates.

[11] Includes 53,300 pounds from precipitates.

[12] Included under "Other districts."

[13] Exclusive of lode output, which is included under "Other districts."

[14] Includes following: West Belt district in Calaveras County; Bishop Creek in Inyo County; Green Mountain in Kern County; North Bloomfield in Nevada County; Alleghany (lode) and Downieville (lode) in Sierra County; Smartville and Yuba River in Yuba County.

[15] Excludes tungsten ore.

[16] Includes metal recovered from tungsten ore.

[17] Includes 65,000 pounds from precipitates.

AMADOR COUNTY

Ione district.—The Newton mine was reopened and developed by J. H. Lester from January 1 until July 2, 1943; work was resumed by the Winston Copper Co. on July 24 and continued until the end of the year. The latter company shipped 3,538 tons of copper ore containing 24 ounces of gold, 1,481 ounces of silver, 639,800 pounds of copper, and 2,339 pounds of lead to a smelter. The ore was removed from points above the 100-foot level, but preparations were made for deeper mining. Diamond drilling carried on by the Bureau of Mines indicated a substantial reserve of copper ore above the 500-foot level.

Mother Lode district.—The Argonaut Mining Co., Ltd., operated a 500-ton flotation and cyanide plant for treatment of old tailings at the Plymouth mine from January 1 to November 30, 1943, when production was suspended in compliance with War Production Board Order L-208.

BUTTE COUNTY

Oroville district.—The Golden Feather Dredging Co. operated a dragline dredge on the Feather River channel at Oroville throughout 1943; an electric dragline excavator equipped with a 5-cubic yard bucket was used. This operation was given a special permit by the War Production Board because gravel was cleared from the Feather River channel and stacked as a levee to protect the town of Oroville. The Morris Ravine Mining Co. operated a drift mine in Morris Ravine throughout the year; an extremely high grade of gravel was produced. The Oroville Gold Dredging Co. operated a connected-bucket dredge equipped with 72 8½-cubic foot buckets on the Feather River 9 miles southwest of Oroville from May 22 to December 31.

Yankee Hill district.—When War Production Board Order L-208 went into effect Hoefling Bros. suspended operations at the Surcease gold mine and shifted attention to the Big Bend mine—a nearby prospect. Development at the Big Bend reached a point in May 1943 where production could be begun, and ore was shipped for concentration at the Surcease mill which had been converted to treat the new type of ore. By the end of the year 3,940 tons of zinc ore had been milled, and 978 tons of concentrates (containing 186 ounces of gold, 5,297 ounces of silver, 138,381 pounds of copper, 16,705 pounds of lead, and 918,586 pounds of zinc) had been produced and shipped. This property was the second-largest zinc producer in the State in 1943. A mill clean-up during the conversion resulted in the recovery of 146 ounces of gold and 394 ounces of silver, which were credited to the Surcease mine.

CALAVERAS COUNTY

Copperopolis district.—The Keystone mine was operated by the Keystone Copper Co. through the North Keystone shaft from January 1 to June 30, when a reorganization was effected which brought in the managerial services of the Lava Cap Gold Mining Corporation organization of Grass Valley, and production continued under the Keystone Copper Corporation. During the year 71,004 tons of copper ore were treated at the nearby redesigned Mountain King flotation mill, and 8,794 tons of copper concentrates containing 81 ounces of gold, 3,409 ounces of silver, and 3,978,872 pounds of copper were shipped. This company was the second-largest copper producer in the State in 1943. The Pacific Mining Co. constructed a flotation plant for treating old tailings at the Union mine. The tailings pile (estimated to contain 600,000 tons) was to be treated at the rate of 1,200 tons daily for a total recovery of 5,000,000 pounds of copper in concentrates carrying 15 percent copper. Production was begun a few days before the end of the year.

Jenny Lind district.—Frank S. Tower operated the Royal mine during 1943; 300 tons of ore yielded amalgamation bullion containing 84 ounces of gold and 50 ounces of silver and 7 tons of flotation concentrates containing 26 ounces of gold and 40 ounces of silver.

West Belt district.—Ernest A. Vogt operated the Collier mine during 1943 and shipped 2,903 tons of zinc ore for treatment by concentration and smelting. The ore contained 274 ounces of gold, 10,277 ounces of silver, 50,231 pounds of copper, 30,582 pounds of lead, and 612,479 pounds of zinc. The mine shaft was sunk to 175 feet, and 464 feet of drifts were driven. G. Ivan Smith operated the Quail Hill mine during the year and shipped zinc-copper ore to a smelter and zinc ore to a concentrator.

FRESNO COUNTY

Friant district.—The Grant Service Rock Co., Consolidated, recovered 36 ounces of gold and 4 ounces of silver in preparing 210,000 tons of sand and gravel for concrete aggregate.

HUMBOLDT COUNTY

Gold Bluff district.—Orick Placers, Inc., operated a washing plant to recover gold from beach sand during 1943.

INYO COUNTY

Bishop Creek district.—The United States Vanadium Corporation produced by flotation a copper concentrate containing a substantial quantity of silver per ton as a byproduct from ore treated primarily for tungsten.

Cerro Gordo district.—L. D. Foreman shipped old tailings from the Cerro Gordo mine to a smelter. Imperial Metals, Inc., and the Golden Queen Mining Co. carried on a joint exploration campaign, reopening the old workings of the Cerro Gordo mine; no ore was shipped. Desert Miners shipped lead ore from the Leary mine in the Swansea section of the Cerro Gordo district during 1943.

Coso district.—The Darwin group of mines—which includes the Defiance, Independence, Essex, Thompson, Lucky Jim, Lane, Promontory, and Columbia claims—was operated by Imperial Metals, Inc., from January 1 to February 28, 1943, when it was reorganized as Darwin Mines (Arthur J. Theis, trustee); this company continued the operation until the end of the year. Of the 15,925 tons of lead ore shipped, 11,579 tons (containing 191 ounces of gold, 87,373 ounces of silver, 20,701 pounds of copper, and 3,036,053 pounds of lead) were smelted; 4,346 tons of ore treated by concentration and flotation yielded 1,257 tons of lead concentrate (containing 44 ounces of gold, 13,315 ounces of silver, 5,538 pounds of copper, 600,426 pounds of lead, and 116,121 pounds of zinc) and 563 tons of zinc concentrate (containing 10 ounces of gold, 2,412 ounces of silver, 2,325 pounds of copper, 57,886 pounds of lead, and 596,308 pounds of zinc). The company mill was remodeled during the year but was not operated. L. D. Foreman shipped old slag, valuable chiefly for lead, from the Last Chance and Lane mines to a smelter.

Fish Springs district.—Eugene Kraft, a lessee, worked the Montezuma mine from March 1 to December 30, 1943; 28 tons of lead ore (containing 3 ounces of gold, 257 ounces of silver, and 8,144 pounds of lead) and 92 tons of zinc-lead ore (containing 4 ounces of gold, 937 ounces of silver, 471 pounds of copper, 19,493 pounds of lead, and 24,551 pounds of zinc) were shipped to smelters.

Modoc district.—E. H. Snyder operated the Colorado group during the first half of 1943; then all operations were suspended. Zinc ore was shipped to a smelter and concentrator. C. C. King shipped lead ore to a smelter from the Defense mine during 1943.

Resting Springs district.—Shoshone Mines, Inc., shipped ore from the Columbia No. 2 mine throughout 1943 and was the largest producer of lead and silver in the State; 22,456 tons of ore shipped to a smelter contained 3,143 ounces of gold, 152,893 ounces of silver, 8,438 pounds of copper, 6,221,280 pounds of lead, and 3,105,820 pounds of zinc.

Slate Range district.—Damon & Damon carried on a development program at the Gold Bottom mine during 1943 and shipped to smelters 2,850 tons of gold-silver ore (containing 380 ounces of gold, 11,380 ounces of silver, 25,222 pounds of copper, and 204,318 pounds of lead) and 757 tons of zinc ore (containing 24 ounces of gold, 1,400 ounces of silver, 6,407 pounds of copper, 58,097 pounds of lead, and 188,718 pounds of zinc). Late in the year a 150-ton flotation mill, reconstructed largely from the equipment derived from dismantling the Mineral Reduction Co. custom mill at Benton Station, was being installed. C. O. Mittendorf shipped lead ore to a smelter from the Ophir mine.

KERN COUNTY

Gorman district.—W. W. Stabler shipped zinc ore to a smelter during 1943 from the Condor mine, formerly known as the Cully Hayes property.

Mojave district.—All important mines in the Mojave district were reported inactive in 1943 as a result of War Production Board Order L–208. Some gold and silver, however, were recovered from clean-ups at mills in the district.

Randsburg district.—The Holcomb Valley Placer Co., lessee of the Monarch Rand mine, produced gold in 1943 as a byproduct of a placer operation carried on primarily for scheelite; gravel was delivered by carry-all to a stationary washing plant. Placer Concentrators also produced gold as a byproduct from a placer scheelite operation at the Patsy and Victory No. 2 mines. Rand Gold Dredging Associates operated a connected-bucket dredge with 82 3-cubic foot buckets at the Tungold mine from January 1 until the dredge capsized June 10; a substantial quantity of gold was recovered, and measures were taken to right the dredge so that operations could be resumed.

LOS ANGELES COUNTY

San Gabriel district.—Robert A. Riggs reported recovery of 26 ounces of gold and 4 ounces of silver as a byproduct in preparing sand and gravel for concrete aggregate. The Consolidated Rocks Production Co. also recovered gold and silver as a byproduct from its gravel-plant operations.

MADERA COUNTY

Daulton district.—The West Lode Reduction Co. recovered copper precipitates by treating mine water from the Daulton mine with scrap iron. Pietro Rosati shipped copper ore to a smelter from the Victory mine.

MARIPOSA COUNTY

East Belt district.—The Bandarita mine was operated by the Bandarita Mining Co. from January 1 to October 1943, when work was taken over by G. A. Ogden; 117 tons of ore and 35 tons of old tailings yielded amalgamation bullion containing 27 ounces of gold and 6 ounces of silver and 2 tons of flotation concentrates containing 7 ounces of gold and 3 ounces of silver. Russell Wilson worked the Feliciana mine from January 1 to July 15, when all production was suspended; 501 tons of gold ore yielded amalgamation bullion containing 495 ounces of gold and 76 ounces of silver and 29 tons of concentrates containing 151 ounces of gold and 39 ounces of silver. Schroeder, Odgers, & Schroeder worked the Schroeder group in the Colorado section of the East Belt district throughout the year; amalgamation of 145 tons of ore yielded 195 ounces of gold and 27 ounces of silver.

Hunter Valley district.—The Mount Gaines Mining Co. was permitted by the War Production Board Order to produce on a restricted basis throughout 1943. Gold ore was treated by amalgamation with flotation. Ernest L. Buerki operated the Ruth Pierce mine during the year, treated 506 tons of old tailings by cyanidation, and recovered 28 ounces of gold and 21 ounces of silver.

Mother Lode district.—P. A. Johns operated the Nelly Kaho mine throughout 1943, treated 196 tons of ore by amalgamation, and recovered 69 ounces of gold and 7 ounces of silver. The Pacific Mining Co. worked the Pine Tree and Josephine mines the entire year; ore was treated at the company 175-ton flotation mill.

NEVADA COUNTY

Grass Valley-Nevada City district.—The Empire Star Mines Co., Ltd., recovered a substantial quantity of gold in 1943 in a mill clean-up during the mine-operation suspension resulting from War Production Board Order L–208. A section of the company North Star mine was operated by the New Verde Mines Co. under special permit from the War Production Board, granted because of the tungsten content of the ore; the principal product was gold. Both the Empire Star Mines Co., Ltd., and the New Verde Mines Co. are affiliates of the Newmont Mining Corporation. The Lava Cap Gold Mining Corporation continued operations from January 1 until June 30, when the War Production Board failed to renew a special permit under which the property was permitted to operate to supply fluxing material. The breaking of ore ceased June 7 and all production June 30; 47,245 tons of ore were treated in the company 400-ton mill. The mill comprised a 400-ton flotation unit, a 25-ton concentrate and middling cyanide unit, and a 350-ton tailing cyanide unit. Cyanide precipitates (containing 675 ounces of gold and 6,502 ounces of silver) and 1,739 tons of flotation concentrates (containing 10,206 ounces of gold, 90,631 ounces of silver, 7,485 pounds of copper, and 18,379 pounds of lead) were produced.

Washington district.—A clean-up of bed rock at the Omega mine yielded 64 ounces of gold and 2 ounces of silver. A clean-up at the Bradley Mining Co. Spanish mine yielded 32 tons of gold ore, shipped to a smelter.

ORANGE COUNTY

Lake Elsinore district.—The Ortega Mining Co. worked the Ortega mine, formerly known as the Old Dominion, from January 1 to October 30, 1943, and shipped silver ore to a smelter.

PLACER COUNTY

Foresthill district.—C. J. Oudin worked the Miller Slope drift mine throughout 1943; 50 cubic yards of gravel yielded 15 ounces of gold and 2 ounces of silver.

Lincoln district.—Goodwin M. Trent worked the Valley View mine for 8 months during 1943 and shipped 52 tons of ore containing 9 ounces of gold, 57 ounces of silver, and 1,871 pounds of copper to a smelter.

Ophir district.—Substantial quantities of gold bullion and gold concentrates were recovered from a clean-up at the Oro Fino mine of Oro Fino Consolidated Mines.

PLUMAS COUNTY

Genesee district.—J. W. Goodhue worked the Pilot mine from April 1 to December 31, 1943; 32 tons of ore shipped to a smelter contained 38 ounces of gold, 408 ounces of silver, and 11,524 pounds of copper.

Johnsville district.—Dump ore at the Jamison mine was treated by amalgamation during 1943. Lee Lakin worked the Plumas-Eureka mine under lease from May 15 to November 1 and shipped to a smelter 67 tons of old tailings containing 57 ounces of gold, 55 ounces of silver, and 4,141 pounds of lead.

SACRAMENTO COUNTY

Folsom district.—The processing of concrete aggregate by Pacific Coast Aggregates, Inc., and the Fair Oaks Gravel Co. at Fair Oaks resulted in the recovery of 249 ounces of gold and 21 ounces of silver. The Natomas Co., after suspending operations late in 1942 as a result of War Production Board Order L-208, was granted a permit to resume operations on a limited scale early in 1943; production was begun on February 1 and continued without interruption until December 31. Two of the company fleet of seven connected-bucket dredges were permitted to work. The operation was carried on under stringent restrictions with respect to labor and supplies. The inactive dredges proved a source of replacements when parts of the active dredges failed. The operating force of the company was found to include many men who were advanced in years and not available for service in war plants elsewhere.

SAN BERNARDINO COUNTY

Buckeye district.—Frank Royer shipped gold ore valuable for fluxing purposes from the Bagdad-Chase mine during 1943.

Randsburg district.—Hoefling Bros. recovered placer gold as a byproduct of an operation carried on throughout 1943 principally for scheelite at the Spud Patch mine; 597,139 cubic yards of gravel were mined with a dragline excavator, of which 134,934 cubic yards were trucked to a stationary washing plant. In addition to scheelite (nuggets of which are known locally as "spuds"), 210 ounces of gold and 45 ounces of silver were recovered.

SAN JOAQUIN COUNTY

Camanche district.—The Gold Hill Dredging Co. was permitted to operate one dredge under special permit from the War Production Board during 1943 and elected to operate its Upper Comanche dredge from January 1 to August 31 and its Lower Comanche dredge from October 1 to December 31. The Upper Comanche dredge is equipped with 66 7¾-cubic foot buckets and the Lower with 87 8½-cubic foot buckets; both use electric power. The Mokelumne Sand & Gravel Co. produced a small quantity of gold as a byproduct in preparing sand and gravel.

SHASTA COUNTY

Flat Creek district.—The Mountain Copper Co., Ltd., began production from the Mattie ore body in the Hornet mine on July 1 and continued until the end of the year. The ore was treated in a 300-ton selective-flotation mill built during 1942 and 1943, and the copper and zinc concentrates were shipped to smelters. In addition, a small quantity of copper ore and copper precipitates recovered from mine water was shipped to a smelter.

Redding district.—The Columbia Construction Co., Inc., recovered 1,555 ounces of gold and 166 ounces of silver as a byproduct during production of 1,500,000 cubic yards of sand and gravel for use in the construction of Shasta Dam. A feature of the operation was a conveyor belt that transported the sand and gravel from the washing plant in the bed of the Sacramento River at Redding to the site of the dam 11 miles distant.

SIERRA COUNTY

Alleghany district.—The American Hill Mining Co. worked the American Hill and Pilgrim Annex mine from July to December 24, 1943; 60 tons of ore were amalgamated and yielded 25 ounces of gold and 3 ounces of silver. The Original Sixteen to One Mine, Inc., carried on limited operations throughout 1943 under permit of the War Production Board. Gold ore was treated by amalgamation and table concentration.

Downieville district.—Ruby Mine continued operations on a maintenance basis at the Ruby drift mine throughout 1943 and produced 323 ounces of gold and 12 ounces of silver from 500 cubic yards of gravel.

Pike district.—W. C. Ennis worked the Bowman and Queen Mary mines, under lease, the entire year; recovery by amalgamation from the former was 81 ounces of gold and 13 ounces of silver from 265 tons of ore and from the latter 34 ounces of gold and 11 ounces of silver from 250 tons of ore.

Poker Flat district.—Hydraulic operations were carried on at the Pioneer Project mine for 3 months during 1943, and a substantial quantity of gold was recovered. C. S. Poor worked the Tennessee Manxman drift mine from January 1 to November 1 and recovered 74 ounces of gold and 8 ounces of silver from 680 cubic yards of gravel.

SISKIYOU COUNTY

Klamath River district.—Larson & Harms recovered 114 ounces of gold and 18 ounces of silver in 1943 from concentrates accumulated at the company Moccasin dragline dredge operation before closing it as a result of War Production Board Order L–208. The Gray Eagle Copper Co. began production at the Dakin or Gray Eagle mine upon completion of the company 700-ton flotation mill in March; 145,165 tons of copper ore yielded 26,666 tons of copper concentrate containing 2,486 ounces of gold, 9,332 ounces of silver, and 10,446,467 pounds of copper. This new producer supplied 58 percent of the copper output of the State during the year.

Liberty district.—E. A. McBroom hydraulicked at the Farnsworth mine from March 1 to May 10, 1943; 500 cubic yards of gravel yielded 22 ounces of gold and 2 ounces of silver.

Scott Bar district.—George C. Noonan and George A. Milne carried on underground quartz-mining operations at the Quartz Hill mine during 1943.

STANISLAUS COUNTY

Knights Ferry district.—The Placer Properties Co. operated a dragline dredge on the Stanislaus River, 8 miles east of Oakdale, from January 1 to December 12, 1943. A. G. Germain operated a dragline dredge, using a dragline excavator with a ½-cubic yard bucket, intermittently from July 15 to December 23. The washing of 655 cubic yards of gravel yielded 12 ounces of gold and 1 ounce of silver. The equipment was designed to be handled by one workman.

La Grange district.—The Tuolumne Gold Dredging Corporation operated a connected-bucket dredge, equipped with 100 12-cubic foot buckets, throughout 1943 on a one-shift basis.

TRINITY COUNTY

Junction City district.—The Goldfield Consolidated Mines Co. hydraulicked at the Red Hill mine from January 1 to December 31, 1943.

TULARE COUNTY

Camp Nelson district.—Chas. T. Williams, a lessee, shipped 6 tons of lead ore from the Cedar Hill mine to a smelter; the ore contained 486 ounces of silver and 6,154 pounds of lead.

TUOLUMNE COUNTY

East Belt district.—Harper Bros. worked the Eureka mine from January 10 to December 15, 1943; 15 tons of ore treated by amalgamation yielded 55 ounces of gold and 12 ounces of silver. F. L. Macpherson carried on development at the Indian Girl mine during the first 3 months of the year.

Mother Lode district.—Miller & Clemson, operating in 1943 as Eagle Shawmut Mine, treated 155,500 tons of gold ore in a 500-ton flotation mill at the Eagle Shawmut mine; amalgamation bullion (containing 279 ounces of gold and 83 ounces of silver) and 3,392 tons of concentrates (containing 9,921 ounces of gold, 3,455 ounces of silver, and 8,251 pounds of copper) were recovered. The War Production Board permitted the mine to operate because the concentrates were needed for the efficient operation of the Selby smelter of the American Smelting & Refining Co. During the year the company made preparations at the Eagle Shawmut mill to handle ore to be trucked from the Penn mine, Campo Seco district, Calaveras County.

YUBA COUNTY

Challenge district.—H. M. Richards did ground sluicing at Ohio Flat and recovered 23 ounces of gold from 1,000 cubic yards of gravel between January 1 and April 15, 1943.

Smartville district.—Operation by the Williams Bar Dredging Co. was suspended on January 13, 1943, under War Production Board Order L-208.

Yuba River district.—Yuba Consolidated Gold Fields was permitted to operate two of its fleet of six dredges from January 1 to December 31, 1943. The dredges in operation were both of Yuba type and used electric power; one had 126 and the other 135 18-cubic foot buckets.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE CENTRAL STATES

(MINE REPORT)

SUMMARY

With few exceptions, the equipped copper, lead, and zinc mines in the Central States were worked throughout 1943 to the fullest extent possible under limitations imposed by labor shortage, material-supply problems, and a damaging flood in the Tri-State zinc-lead region of Kansas, Missouri, and Oklahoma. As the year began copper and zinc were in group I of the War Production Board Material Substitutions and Supply List, and great emphasis was placed on increasing the output of these metals, although continuance of high lead production was also considered essential. During the year additional old mines containing normally submarginal ores were reopened and equipped for wartime operation at premium prices or under Government loans or contracts, and 14 worth-while newly developed mines were brought to the productive stage. Expanded use of labor-saving machinery partly offset manpower shortages and enabled many mines to increase crude-ore output. The use of machinery did not always reduce costs materially, especially at small mines. Decreased labor efficiency and wage increases added to operating costs. Therefore, to maintain necessary production under the ceiling metal prices most mine quotas had to be adjusted downward to provide additional Government premiums, or the Government bought the concentrates or metal at special prices. The drive for increasing zinc production from marginal and submarginal ores eased late in October, when B- and C-level premiums were denied to mines not already operating and the Government ceased financing new zinc projects. In November notice was given that applications for special copper premiums would not be accepted after December 31, 1943. The output of both crude mine ore and reclaimed old tailings increased in 1943, but the average metal content of all classes of material treated (except copper tailings) decreased. The most pronounced decrease occurred in zinc and zinc-lead ores and old tailings, and the output of recoverable zinc decreased 14 percent from 1942. Lead output decreased 8 percent, and copper increased 2 percent. The "mine" value of the output of all three metals rose materially in 1943 owing to increases in Government bonuses to mine operators; the market prices of the metals at smelters were not changed.

The silver produced in the Central States is a minor byproduct derived from some of the base-metal ores. No mine production of gold was reported in the Central States from 1941 to 1943, inclusive.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in the Central States, 1939–43, in terms of recovered metals

Year	Mines producing	Ore and old tailings (short tons)	Gold		Silver	
			Fine ounces	Value	Fine ounces	Value
1939	251	22,972,151	[1] 4	$140	315,953	$214,465

[1] From placer prospecting.

Silver.—The mine output of silver in the Central States in 1943 comprised 111,285 ounces derived from refining lead bullion recovered from Southeastern Missouri lead ores, 48,479 ounces from Michigan copper ore, and 2,153 ounces from galena concentrates produced in milling Southern Illinois zinc-lead fluorspar and lead fluorspar ores.

Copper.—Michigan mines yielded 97 percent of the Central States total output of recoverable copper in 1943; the State production increased 2 percent over 1942. The Southeastern Missouri region produced 1,340 tons of recoverable copper in 1943, all a byproduct made in smelting lead concentrates. Ore containing lead, copper, cobalt, nickel, and iron was mined in development at Fredericktown and stock-piled for treatment upon completion of a mill being constructed. One unit of the mill began operating in February 1944 and made copper concentrates as one of the products.

Lead.—Mines in Southeastern Missouri continued to supply most of the lead produced in the Central States, but their total output of recoverable lead declined 9 percent in 1943 from 1942. Some lead ore from the newly developed Park City Consolidated mine and lead-copper-cobalt-nickel-iron ore from the St. Louis Smelting & Refining Co. property were extracted in development and stock-piled pending completion of a mill under construction on each of the properties; both mills began operating early in 1944. Lead production in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri) increased slightly. The combined output of Arkansas, Central Missouri, Illinois, Kentucky, and Wisconsin decreased slightly.

Zinc.—The Tri-State region contributed 90 percent of the Central States total mine output of zinc in 1943 and 92 percent in 1942. A general review of mining and milling in this region is given in this chapter under Southwestern Missouri. Zinc production in the Wisconsin-Northern Illinois (Upper Mississippi Valley) district increased materially in 1943. In the Southern Illinois-Kentucky zinc-lead fluorspar region the greatest efforts were directed toward expanding production of fluorspar, and the output of zinc decreased. Other small zinc-producing areas included Southeastern and Central Missouri; Owen County, Ky.; Northern Arkansas; and Arbuckle Mountains (Southern Oklahoma).

MINE PRODUCTION BY STATES AND REGIONS

Mine production of silver, copper, lead, and zinc in the Central States in 1943, by States, in terms of recovered metals

State	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value

---

[1] Excludes lead-bearing material mined with fluorspar and from which some lead was recovered as a byproduct of the mining and milling of the fluorspar.

Of the seven lead- and zinc-producing regions in the Central States, three are not limited to a single State. The output, by regions, in 1943 is given in the following table.

Mine production of lead and zinc in the Central States in 1943, by regions

Region	Lead[1]		Zinc[2]		Total value
	Short tons	Value	Short tons	Value	
Concentrates:					
Joplin or Tri-State	46, 345	$5, 575, 240	376. 236	$37, 593, 954	$43, 169, 194
Southeastern Missouri	257, 145	18, 475, 374	2, 009	78, 047	18, 553, 421
Upper Mississippi Valley[3]	1, 430	120, 788	28, 768	1, 745, 906	1, 866, 694

[1] Only small-scale intermittent mining done in Arkansas from 1918 to 1943; Kentucky and Illinois excluded because part of the metal output (lead and zinc) was a byproduct of fluorspar mining, and the quantity of metal-bearing material hoisted could not be determined.

[2] The percentages represent metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in other Central States the metals are lead and zinc combined, relative proportions of which are shown in third table of this chapter and in tables of tenor of ore given in sections devoted to the respective States.

MINING AND METALLURGIC INDUSTRY

Under the ceiling metal prices that prevailed in 1943, the extent to which copper, lead, and zinc mine operators in the Central States could expand mining and development to maintain desired metal production from the low-grade ores (which constitute the bulk of the reserves) was governed largely by the amount of bonus or other form of Federal aid provided and the supply of manpower and materials available. The broadened Premium Price Plan permitted downward adjustment of quotas where required to maintain output, and large increases occurred in total premium payments to copper, zinc, and zinc-lead mines and tailing mills; the principal producing lead mines continued to operate without benefit of the Government premium. The Government, through the Reconstruction Finance Corporation and its subsidiaries, as well as the Bureau of Mines and the Geological Survey, in cooperation with the War Production Board, sponsored mining, development, prospecting (including examination, ore testing, and drilling), and milling projects designed to maintain necessary production and provide additional ore reserves. The principal new developments in mining in 1943 were the use of jumbo drill holders in certain large open stopes of zinc-lead mines in the Tri-State district and the extended use of mechanical loaders in the smaller mines. Flotation was used in conjunction with gravity concentration in nearly all the mills, and flotation concentrates comprised 25 percent of the total copper concentrates, 44 percent of the lead concentrates, and 57 percent of the zinc concentrates produced. The concentrates generally have an established market, although war conditions caused some diversions from customary channels. Copper concentrates from Michigan were smelted in plants at Hubbell and Houghton. The lead concentrates from Southeastern Missouri were sent to the Herculaneum (Mo.) and Alton (Ill.) smelters; those from the Tri-State district went mostly to the Galena (Kans.) smelter, other destinations being smelters at Herculaneum and Alton and oxide plants at Coffeyville, Kans., and Hillsboro, Ill. Zinc concentrates from the Tri-State district moved to plants at Bartlesville and Henryetta, Okla.; Coffeyville, Kans.; Fort Smith and Van Buren, Ark.; Danville, East St. Louis, Hillsboro, and La Salle, Ill.; Donora, Pa.; and Moundsville and Meadowbrook, W. Va. The lead and zinc concentrates from Wisconsin, Illinois, and other scattered districts in the Central States were shipped to one or more of the foregoing plants.

REVIEW BY STATES

ARKANSAS

Zinc and lead mining in Arkansas in 1943 was confined to intermittent small-scale operations. Zinc concentrates shipped totaled 235 tons—283 tons less than in 1942—and comprised 125 tons of sulfide, containing 55.20 percent zinc, and 110 tons of carbonate and silicate, containing 34.55 percent zinc; all were shipped to the Fort Smith (Ark.) smelter. Only 1 ton of lead concentrates was shipped in 1943 and 3 tons in 1942. Most of the mining and development done in 1943 was financed by Reconstruction Finance Corporation loans. The producing mines were the Gloria-Jack Pot (Moark) and Lead Hill in Boone County, the Silver Queen (Silver Hollow Mining Co.) in Marion County, the Baker-Brewer and Bald Hill in Newton County, the Excelsior in Searcy County, and the Fugat Hollow in Sharp County.

ILLINOIS

Northern Illinois (see section on Wisconsin for output data).—The zinc and lead ore and rougher jig zinc-lead concentrates produced in Northern Illinois in 1943 were shipped to the Vinegar Hill Zinc Co. custom flotation mill near Cuba City, Wis. Gill Bros. worked the North Unity mine from January 1 to June 15 and the adjacent Hughlett and Gray from January 1 to February 4. The Little Six Mining Co. cleaned up some additional ore from the Hughlett and Gray after it was shut down by Gill Bros. The Ginte Mining Co. built a 400-ton jig mill at the Ginte mine and operated it from September 14 through December. Part of the Ginte ore was shipped crude to the Vinegar Hill mill. Exploratory drilling by the Bureau of Mines on the Gray property south of Galena showed a large zinc deposit somewhat lower in average grade than that of the deposits being worked in the Wisconsin-Northern Illinois region. The Lonergan land near Menominee was also drilled.

Southern Illinois.—In Southern Illinois most of the output of zinc and lead continued to come from the Mahoning Mining Co. zinc-lead fluorspar mines near Cave in Rock, Hardin County. In 1943 the company operated the W. L. Davis-Deardorff, Anna L. Davis, East Green, and West Green shafts, which are 311, 165, 230, and 363 feet deep, respectively. The ore from all four shafts was trucked to the company flotation mill at Rosiclare for treatment. During the year additional units were installed in the mill, increasing its daily capacity from 200 to 320 tons. The products of the mill were fluorspar concentrates (mostly of acid grade), zinc concentrates averaging 62.89 percent zinc, and lead concentrates averaging 65.81 percent lead. Besides company ore, the mill treated a relatively small quantity of custom ore and bulk concentrates containing zinc, lead, and fluorspar from other operations, including the Aluminum Ore Co., Roberts & Frazier, and Rosiclare Lead & Fluorspar Co. mines. Hillside Fluor Spar Mines shipped byproduct lead concentrates. The Minerva Oil Co. continued developing its zinc-fluorspar property northeast of the Mahoning mines and also worked on constructing a 200-ton differential flotation mill under a Defense Plant Corporation agreement. A 645-foot double-compartment shaft was sunk, and drifts were run on the 640-foot level, from which the ore will be hoisted. The mine and mill began producing in March 1944. The total output of lead concentrates in Southern Illinois in 1943 was 3,053 tons averaging 65.48 percent lead and about 7 ounces of silver to the ton, and that of zinc concentrates was 8,302 tons averaging 62.89 percent zinc. Production (in terms of recoverable metals) amounted to 1,959 tons of lead, 2,153 ounces of silver, and 4,699 tons of zinc compared with 2,211 tons of lead, 104 ounces of silver, and 7,689 tons of zinc in 1942.

KANSAS

The Kansas zinc and lead mines are in the Tri-State (Joplin) mining region, embracing parts of Cherokee County, Kans., and Ottawa County, Okla., and about 12 counties in Southwestern Missouri. General details of the Tri-State mining industry are given in following pages on Southwestern Missouri.

The Kansas output of zinc and lead varied little in 1943 from 1942. The largest part of the production continued to come from the Baxter Springs-Blue Mound-Treece area, which yielded 97,852 tons of zinc concentrates and 12,117 tons of lead concentrates in 1943 compared with 96,856 and 12,183 tons, respectively, in 1942. About 41 percent of the total crude ore mined in the area in 1943 was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Most of the ore was transported to the mill over the Northeast Oklahoma Railroad, which has spur tracks from the main line to the principal ore-hoisting shafts. The Eagle-Picher Westside mines, Webber mines, Big John, Black Eagle, Leopard, Parmenter, and Wilbur mines were among the large producers in 1943. Part of the crude ore from the Westside (Barr) was milled in the Westside mill until May, when the mill was shut down; the rest of the Westside crude-ore output and all of that from the other mines was sent to the company Central mill at Cardin, Okla. Kansas mines shipping custom ore to the Central mill included the Bendelari, Ebenstein (Bilwil), Guaranty No. 2 (Robob), Ozark (Henshaw), and Wright. The Paxson mine and mill, reopened by Eagle-Picher as agent for the Metals Reserve Co., were operated from April through December, and the adjoining newly developed Stoskopf and Swalley "D" mines, included in the Paxson operation, also began producing during the year.

The Ballard central mill of the St. Louis Smelting & Refining Co. continued to treat mine dirt from the company Ballard, Bailey, Clark, English "O", Keith, Shanks, Slaughter, and Walter H. mines. The company Moore mine was under development. The Beck Mining Co. No. 3 mill at Baxter Springs operated throughout 1943, treating chiefly custom ore from the MacArthur, Southern, and Swalley mines and company ore from the Smith mine. Beginning November 1 the company also operated the Swalley mine, purchased from the Mineral Products Co. In October the Southern ore was diverted to the Youngman mill. This mill, which was enlarged during the year, treated ore mined by the Harris Mining Co. from the Robinson, Silver Fox, and Evans-Wallower No. 24 mines; it also handled ore from the Federal Muncie group, reopened in June after a 2-month shut-down following the fire that destroyed the Gordon central mill. The Bilharz Mining Co. operated its mill and three shafts on the Bilharz-Brewster property. The Dines Mining Co. mill ran on company ore from the Hartley mines and Douthat (Okla.) mine and custom ore from the Childress-Heggam (Okla.), Stebbins (C. K. & E.), Jarrett (Robinson), and other mines. The Liza Jane (Lula Bell) mine shipped ore to the Farmington mill (Okla.). The Madison (Peru) and New Blue Mound mines and mills continued producing. The Wade Bros. mill treated company ore from the Wade-Hunter and White-McKay mines and custom ore from 26 other small Kansas and Oklahoma mines. The Captain, Early Bird, and Worley tailings mills were run throughout the year.

At Galena the Eagle-Picher Mining & Smelting Co. continued development and pumping and shipped ore from the Murphy and Illinois shafts to the Bird Dog and Central mills. The Galena Mining Co. also shipped ore to these mills. In the Peacock area the Carson Mining & Milling Co. remodeled its mill and operated it from August through December on old tailings. At Lawton the Eastern Mining Co. shipped ore from the Fletcher mine to the Playter mill in Missouri.

At Waco the St. Louis Smelting & Refining Co. operated its No. 9 mill on ore from company mines in the Kansas and Missouri parts of the Waco district and custom ore from the J. M. Bennett and Oscar Bennett leases in Kansas. The F. W. Evans mill handled ore from company leases on both sides of the Kansas-Missouri State line.

Mine shipments of lead and zinc in Kansas, 1939–43

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1939	30	17,845	$1,010,106	126,235	$4,300,365	13,697	$1,287,518	68,971	$7,172,984
1940	34	15,424	907,296	105,070	4,420,360	11,927	1,192,700	57,032	7,186,032

1942	81	12,253	1,167,302	103,247	6,926,745	9,419	1,262,146	55,874	10,392,564
1943	82	12,243	1,457,764	105,656	10,567,578	9,213	1,381,950	56,944	12,299,904

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the value of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Kansas, 1942–43

	1942		1943	
	Crude ore	Old tailings	Crude ore	Old tailings

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

KENTUCKY

Production of recoverable zinc in Kentucky increased from 407 tons in 1942 to 931 tons in 1943, and lead decreased from 335 to 240 tons. All the output in 1943 was derived from sulfide ores; zinc concentrates produced totaled 1,694 tons containing 61.04 percent zinc, and lead concentrates 321 tons containing 76.01 percent lead. The Eagle-Picher Nunn mine near Marion, worked from January to August, was the principal producer of zinc; the crude ore was shipped to company mills near Cardin and Picher, Okla. The United States Coal & Coke Co. shipped byproduct zinc and lead concentrates made in milling fluorspar. The Kentucky Fluor Spar Co. shipped byproduct lead concentrates. The Corod Minerals Corporation nearly completed construction of a 150-ton custom flotation mill at Marion to treat zinc- and lead-bearing fluorspar; funds were provided under a Defense Plant Corporation agreement. In Owen County the Twin Valley Mining Co. operated the Twin Valley (old Gratz) zinc-lead mine and 100-ton jig- and flotation-concentration mill from February through December. The mine is opened by two shafts 160 and 180 feet deep. Shortage of labor prevented capacity output.

MICHIGAN

In 1943 the Lake Superior copper-mining region in Michigan completed a century of continuous activity, including 99 years of uninterrupted annual production that averaged about 95,588,000 pounds of refined copper. The smelter output for 1845 (the first productive year of this period) is recorded in Mineral Resources as 26,880 pounds and for 1916 (the peak year) as 269,794,531 pounds; in 1943 the mine production was 93,528,000 pounds. In recent years, particularly after the consolidation in 1923 of the Ahmeek, Allouez, Calumet and Hecla, Centennial, and Osceola Consolidated mining companies, the number of operating companies has been small; during the 6-year period ended in 1943 they comprised the Calumet and Hecla Consolidated Copper Co., the Copper Range Co., the Isle Royale Copper Co., and the Quincy Mining Co. When the need for expanding copper output became imperative in 1941, the Lake Superior was one of the first regions to receive the attention of Government procurement agencies with a view to utilizing ores that were submarginal under the 12-cent ceiling price. Agreements were consummated providing for purchase by the Government of copper produced from certain mines at special prices, based upon the cost of production. In 1943 some of the mines continued to receive special prices, and some received premium prices under the Premium Price Plan. The average value per pound of fine copper reported by the mine operators (including premiums for overquota production and increment from special prices) was 16.19 cents compared with 12.83 cents in 1942. The total rock treated increased from 1,952,781 tons in 1942 to 2,311,669 tons in 1943, and reclaimed old tailings decreased from 2,409,859 to 2,091,925 tons. The tailings yielded 32 percent of the total copper in 1943 and 34 percent in 1942.

The concentrate ("mineral") produced at mills in Michigan in 1943 and the mass copper shipped direct from the mines were smelted at plants of the Calumet and Hecla Consolidated Copper Co. at Hubbell and the Copper Range Co. at Houghton. Some of the copper bullion was cast into anodes and shipped to the electrolytic refinery at Laurel Hill, N. Y., where silver was recovered. Silver was also recovered by hand-picking at the mine and from some of the concentrates.

Mine production of silver and copper in Michigan, 1939–43 [1]

Year	Silver (fine ounces)	Copper			Concentrate ("mineral")		Crude ore and sands (short tons)
		Pounds	Yield				
			Pounds per ton of crude ore and sands	Percent	Pounds	Yield (percent copper)	
1939	101,878	87,970,000	19.1	0.96	136,771,339	64.3	4,603,751
1940	88,657	90,396,000	20.4	1.02	138,451,495	65.3	4,438,219
1941	60,796	92,880,000	21.7	1.08	141,100,268	65.8	4,282,448
1942	61,674	91,358,000	20.9	1.05	141,372,582	64.6	4,362,640
1943	48,479	93,528,000	21.2	1.06	143,142,155	65.3	4,403,594

[1] Figures based upon actual recovery of copper from "mineral" smelted and estimated recovery from "mineral" not smelted during year.

Value of silver and copper produced in Michigan mines, 1939–43

Year	Silver	Copper		Total
		Total	Per ton of crude ore and sands	
1939	$69,154	$9,148,880	$1.99	$9,218,034
1940	63,045	10,214,748	2.30	10,277,793
1941	43,233	10,959,840	2.56	11,003,073
1942	$43,857	[1] $11,054,318	[1] $2.53	$11,098,175
1943	34,474	[1] 12,158,640	[1] 2.76	12,193,114

[1] Value of copper calculated at average weighted price (including Government bonuses) for all domestic copper sold (see first table of this chapter, footnote 3). If calculated at actual prices paid to Michigan operators, the value of the copper was—1942: $11,722,792, or $2.69 to the ton of crude ore and sands; 1943: $15,139,831, or $3.44 to the ton.

In 1943 the Calumet and Hecla Consolidated Copper Co. operated the Ahmeek, Central, Douglass, Iroquois, No. 4 North Kearsarge, and Peninsula mines, the Ahmeek stamp mill, the Lake Linden and Tamarack reclamation plants, and the Hubbell smelter. All the mines except the Iroquois and Central were operated throughout the year. The Iroquois is a newly developed property, opened by a 1,778-foot inclined shaft started on the Peninsula property about the middle of 1942 and brought to the productive stage in February 1943. The Central mine was reopened for further exploration and development in 1942 and was in production from April 1943 to the end of the year. Pumping and other preliminary work on reopening the Centennial mine under a contract with the Metals Reserve Co. was carried on continuously in 1943, and preparations for mining on the 37th and 39th levels got well under way. On the Allouez-Douglass land a new two-compartment shaft, known as the Allouez No. 3, was sunk to an incline depth of 531 feet, and 1,223 feet of drifts and crosscuts were driven on the 400-foot level. With regard to mining costs, the annual company report to stockholders states:

> Costs of production continued to climb in 1943, due principally to the general increase in the wage scale. The cost of coal and other supplies was substantially higher. Decreased labor efficiency throughout the operations and lower grade ore at the Ahmeek branch also contributed to the general increase in costs. Toward the end of the year, however, labor efficiency was showing marked improvement, which continued into 1944.

Other extracts from company annual report follow:

> The Tamarack dredge moved into the mixed conglomerate and amygdaloid zone in November, and production from that deposit in the future is dependent entirely upon the price of copper. The plant is being remodeled for most economical treatment of low-grade amygdaloid sands. The Lake Linden dredge was in the oldest and richest conglomerate sand until December, but for the five winter months will operate in the amygdaloid sand bank, returning for the final clean-up of conglomerate in the spring. Operations in the amygdaloid are possible only because of the war demands for copper, at a premium price. The Calumet mill, idle since 1939, is being reconditioned to enable it, in conjunction with the adjoining leaching and flotation plants, to treat the conglomerate production from No. 3 Allouez. It will also treat any future production of amygdaloid rock in excess of the capacity of the Ahmeek mill. The cupro-ammonium leaching process, used by the company for treating copper-bearing tailings, was also used at the Lake Linden leaching plant in 1942 and 1943 for treating copper- and brass-coated steel scrap generated in connection with war production.

The Copper Range Co. operated its Champion and Globe mines, Freda mill, and Houghton smelter throughout 1943 and the tailings-recovery plant about 6 months. Data extracted from the annual company report to stockholders follow. Ore milled from the two mines increased from 355,630 tons in 1942 to 366,355 tons in 1943, but the production of fine copper decreased from 17,772,116 to 16,886,013 pounds. The tailings plant produced 571,674 pounds of refined copper in 1943. Since March 1, 1943, the mine production has been sold to the Government at special prices under an agreement that expired February 29, 1944, but has been extended for 3 months. The tailings plant operates under the Premium Price Plan. Exploration and development were carried on at better than average rates but resulted in no appreciable increase in ore reserves. No agreement was reached in negotiations with Government agencies for development of the White Pine property, and, unless the war need for copper justifies reopening negotiations with the Government, the company will make no attempt to develop the property until conditions warrant. The smelter continued to handle custom shipments in addition to concentrates and mass copper from company properties.

Copper production by the Isle Royale Copper Co. was 6,279,771 pounds, a 1-percent decrease from 1942. According to the annual company report to stockholders, operations in 1943 were hampered by shortage of labor and a high rate of absenteeism. The yield of refined copper per ton of rock stamped was 20.359 pounds, and the over-all production cost was 23.255 cents per pound. The stamp mill operated on a 5-day a week schedule, and owing to the low volume of rock only two heads were operated most of the time. Rock stamped totaled 308,446 tons compared with 315,142 tons in 1942. Further progress was made in mechanizing the mine. Wage increases awarded employees of the company by the Nonferrous Metals Commission in February 1943 necessitated an increase in the price of copper, and the company obtained a 1-year contract with the Metals Reserve Co., effective March 1, 1943, under which the latter agreed to buy the Isle Royale copper concentrates at a special price; the contract was renewed March 1, 1944, for 3 months.

The Quincy Mining Co. continued to operate the Quincy mine and stamp mill. Both the tonnage of rock treated and the yield of copper per ton were lower than in 1942. Beginning November 1, 1943, the company also operated its new 4,000-ton reclamation plant, erected to re-treat old stamp sands in Torch Lake. The plant includes a suction-type dredge with a pipe line on pontoons reaching from the dredge to the shore, a shore pumping-classifying plant, and a regrind-flotation mill. The shore plant and mill were designed and built by the Calumet and Hecla Consolidated Mining Co. Funds were provided through a loan of $1,150,000 obtained by the Quincy Mining Co. from the Metals Reserve Co., to be amortized by payment of 4 cents per pound of copper produced. Details of the enterprise are given in a recent publication.[1] Arcadian Mines, Inc., extended the Ripley adit about 800 feet to a total length of about 2,755 feet. Ore sent to the Ahmeek mill for a test run yielded 11 tons of copper. Work was suspended on October 15, owing to lack of funds.

MISSOURI

Missouri continued to be the largest lead-producing State and ranked eleventh in zinc production in 1943. The output of both lead and zinc was less than in 1942. Silver and copper are recovered in relatively small quantities as byproducts in smelting lead concentrates from Southeastern Missouri; the quantity of silver recovered was 111,285 ounces and copper 1,340 tons in 1943 compared with 69,106 ounces and 1,300 tons, respectively, in 1942. These two metals occur in such small quantities per ton of concentrates that no value is attached to them in the sale of the concentrates. The lead output of the State comes largely from the Southeastern Missouri region and the zinc mostly from Southwestern Missouri. In 1943 the Central district of Missouri produced small tonnages of lead and zinc concentrates; the figures are included with those of Southeastern Missouri in the table that follows.

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[2] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.

[3] Includes 4,720 tons of zinc-lead carbonate concentrates containing 893 tons of recoverable zinc and 172 tons of lead.

[4] Includes 1,280 tons of zinc-lead carbonate containing 208 tons of recoverable zinc and 28 tons of lead.

[5] Includes 450 tons recovered from lead-smelter slags.

[6] Includes 2,009 tons of zinc-lead carbonate containing 460 tons of recoverable zinc and 120 tons of lead.

[7] Includes 360 tons recovered from lead-smelter slags.

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Southeastern and Central Missouri.—Although production of recoverable lead in the Southeastern Missouri disseminated-lead district decreased from 197,291 tons in 1942 to 179,012 tons in 1943, the district output of lead was still much larger than that of any other district or State in the United States. The mines of the St. Joseph Lead Co. contributed most of the district output in both years. The high rate of ore extraction in recent years required a greatly expanded program of exploration and development to maintain ore reserves. Diamond drilling at four groups of company mines in St. Francois County totaled 1,240,845 feet in 1941, 2,305,272 feet in 1942, and 3,201,055 feet in 1943. Drifting and raising totaled 41,585 feet in 1941, 77,859 feet in 1942, and 69,158 feet in 1943. In 1943 the company continued to operate the Bonne Terre, Desloge, Leadwood, and Federal mills, which together have a rated daily capacity of 21,400 tons. Treatment is by table concentration followed by flotation. All the concentrates produced were lead concentrates, part of which were shipped to the Federal smelter at Alton, Ill., and part to the company smelter at Herculaneum, Mo. The concentrates contain a little silver, copper, and zinc, some of which are recovered in smelter byproducts. Some zinc was recovered as metal in 1943 at the Herculaneum smelter, where the company installed an electrothermic zinc plant with a view to adapting it to the treatment of old zinc-bearing slag from the smelter dump and new slag from current lead smelting. In Madison County the Mine La Motte mine and 1,500-ton mill of the Mine La Motte Corporation (50-percent owned by the St. Joseph Lead Co.) were run continuously. Some old tailings were included in the mill feed during the year. Mine development and drill prospecting totaled 4,336 feet of drifts and 59,507 feet of churn drilling. The Fredericktown Lead Co. operated its 400-ton mill and the Catherine and Fleming lead mines northwest of Fredericktown. The company, in cooperation with the Missouri Geological Survey, did prospect churn drilling in an undeveloped area on the Catherine property and discovered an ore body estimated to contain 250,000 tons of better than 3-percent ore, upon the basis of drilling done to the end of the year. Shaft sinking was begun early in 1944. The St. Louis Smelting & Refining Co. continued developing the leased Missouri Cobalt Co. group of mines and company-owned properties at Fredericktown and nearly completed installing a 600-ton all-flotation mill under a Defense Plant Corporation contract. The ore contains lead, copper, cobalt, nickel, and iron; that mined in development in 1943 was stock-piled. One unit of the mill began operating in February 1944, making four commercial products—lead, copper, cobalt-nickel, and iron concentrates. Before being shipped, the cobalt-nickel concentrates are treated in a reverberatory furnace and roaster installed adjacent to the mill. The Park City Consolidated Mines Co., which had drilled out a lead ore body on the Ruth property south of Fredericktown, worked on sinking a 370-foot shaft, driving development drifts, and building a 500-ton all-flotation mill during most of 1943. Work after June was financed by a Reconstruction Finance Corporation loan. Shipments of concentrates were begun in January 1944. Of the 257,145 tons of lead concentrates made in 1943 in Southeastern Missouri, about 121,712 tons were flotation concentrates.

At Valles Mines, Jefferson County, the DeSoto Lead & Zinc Co. built a 200-ton gravity-concentration mill and operated it from May through December on zinc-lead-iron ore (mostly carbonate) from dumps on the Valle Mining Co. properties in Jefferson and St. Francois Counties. The concentrates, averaging 27 percent zinc and 7 percent lead, were shipped to the Coffeyville (Kans.) pigment plant. The Bureau of Mines did exploratory churn drilling on the Ozark-McGregor zinc property near Potosi.

In Central Missouri the Wemhaner Mining Corporation continued to mine zinc, lead, and coal from the open-pit mine on the Monarch Coal & Mineral Co. land in Moniteau County. The ore was treated in the 100-ton jig mill on the property. Lessees at the Lowery property near Enon shipped some high-grade lead ore and built a small mill.

Southwestern Missouri.—The first five paragraphs and the graphs under this heading pertain to the Tri-State mining industry as a whole; the remaining text reviews mining and milling in Southwestern Missouri only.

The Tri-State region continued to be much the largest zinc-producing region in the United States, although it contributed only 27 percent of the total domestic mine output of zinc in 1943 compared with 31 percent in 1942, 35 percent in 1941 and in 1940, and 38 percent in each of the 3 preceding years. Production of zinc concentrates decreased from 478,403 tons in 1941 to 443,847 in 1942 and 376,236 in 1943. Lead concentrates decreased from 53,690 tons in 1941 to 44,857 in 1942 and then increased to 46,345 in 1943. The decreases in zinc in the past 2 years were due primarily to depletion of high-grade ore reserves, but part of the larger decrease in 1943 is attributable to set-backs in operating schedules caused by labor shortage, the destruction of two large mills by fire, and extensive damage done by a record flood in May. About 58 mills were operating in the region in December 1943 (including 17 tailing mills) compared with 51 in December 1942 (including 15 tailing mills). Production of zinc concentrates from old tailings was 56,857 tons in 1943 compared with 65,096 in 1942. Stocks of concentrates in mill bins were small at the end of 1943, but a sizable tonnage of zinc concentrates was accumulated later at the Paxson mill—a Metals Reserve Co. project.

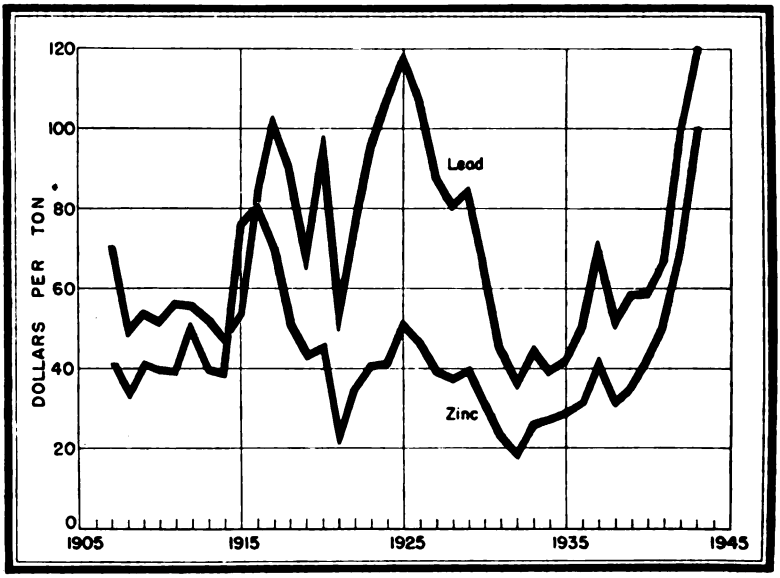

FIGURE 1.—Average prices received by sellers per ton of concentrates in the Tri-State district, 1907–43.

The method of marketing the mine output of the Tri-State or Joplin region is explained in the reports of this series for 1940 and 1941. The total value given for all concentrates produced in the region is based upon actual receipts by the sellers, including premiums paid by the Government since February 1, 1942, for overquota mine production. Under the ceiling prices of 8.25 cents a pound for zinc and 6.35 for lead at East St. Louis, the quoted weekly market price for zinc concentrates at Joplin remained $55.28 a ton throughout 1943 and that for lead concentrates $76.54. Government premiums were paid on most of the concentrates sold in 1943, the amount paid depending upon the quota levels assigned to the individual mine.

An A-level quota carried a premium of $29.70 a ton for 60-percent zinc concentrates and $41.80 for 80-percent lead concentrates; B-level, $59.40 and $83.60; and C-level (applies to zinc only) $89.10. The average total price in 1943 was $99.92 a ton for zinc concentrates and $120.30 for lead concentrates compared with $69.63 and $99.36, respectively, in 1942.

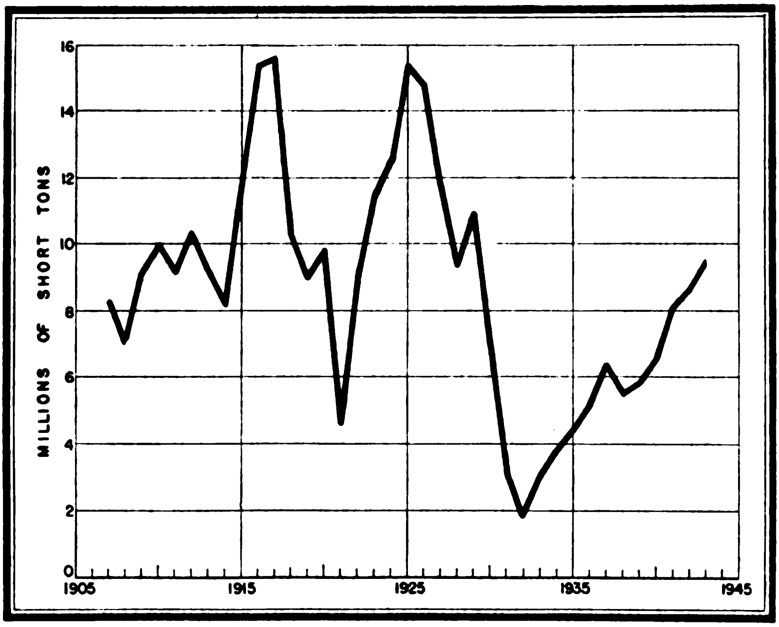

FIGURE 2.—Quantity of crude ore milled in the Tri-State district, 1907–43.

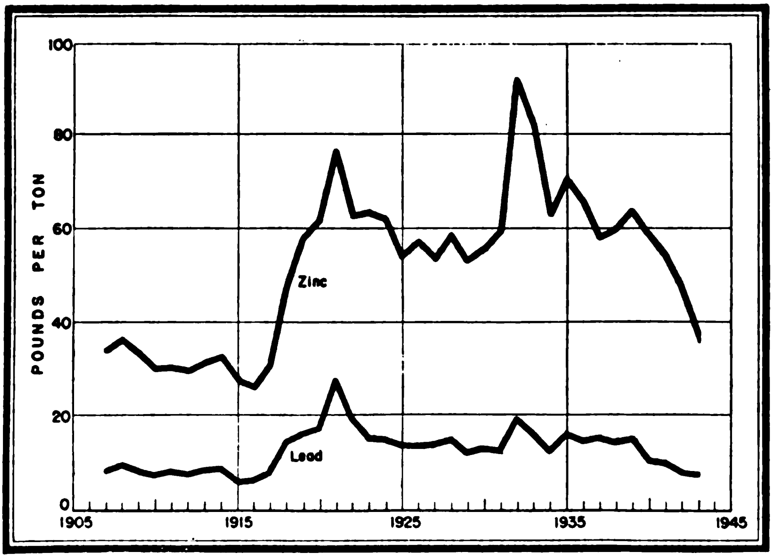

FIGURE 3.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907–43.

The mining companies continued prospect drilling in outlying areas in 1943 but found little ore. One new shaft 349 feet deep was sunk in previously drilled ground in Oklahoma 4 miles farther west than any present or former productive Tri-State mine workings. About 17 new shafts (averaging 200 feet in depth) were sunk in productive areas, and nearly as many old shafts were reopened; the number of old shafts closed, however, exceeded the number reopened. In August the National War Labor Board authorized all Tri-State mining companies to increase wages of miners not to exceed 50 cents a day, and increases were granted immediately upon approval of individual applications. Most of the mines are now equipped with drags or other types of underground mechanical loaders. An innovation in the field was the use in some Eagle-Picher mines of specially designed caterpillar jumbo drill holders, which increased materially the quantity of rock broken per drill. Valuable data on drill performance, mechanical loading, haulage, and other items involved in the extensive operations of the Eagle-Picher Mining & Smelting Co. (many of which exemplify general Tri-State practice) are given in the November 1943 issue of the Engineering and Mining Journal, designated Eagle-Picher number.

Federal agencies working to aid in maintaining zinc production in the Tri-State district comprised the War Production Board local office of priorities, material supply, and regulations; the Reconstruction Finance Corporation mine loan office; the Metals Reserve Co. agent handling premium payments and other agents operating certain marginal mines west of Baxter Springs and drilling to check ore reserves in the Webb City area; the Defense Plant Corporation; the Bureau of Mines district office for exploratory work on zinc deposits, in which the Geological Survey cooperated; and the United States Employment Service (War Manpower Commission).

In Southwestern Missouri zinc production was seriously hampered by a flood in May, which inundated large surface and underground areas, causing damage to certain shafts, mine workings, and installations that required several months to repair. The worst damage was in the Oronogo and Stotts City areas. The Oronogo Circle open-pit mine of the Oronogo Mutual Mining Co. was shut down completely for several weeks and was then worked only on upper levels until drainage was completed in December. Despite this set-back the mine continued to be the largest producer of zinc in Missouri. Part of the ore was treated in the Eagle-Picher American mill at Oronogo, and part was shipped to the Bird Dog mill in Oklahoma.

Other large Missouri producers were: Kansas Explorations, Inc., operating the Snapp and Buckingham mines and the Snapp mill near Oronogo and the Jasper mine and mill near Joplin; Federal Mining & Smelting Co., operating the Granby-American and Davis groups of mines and mill at Granby and the Duenweg mine (reopened in April) and new mill at Duenweg; St. Louis Smelting & Refining Co. and F. W. Evans Mines, both of which shipped ore from mines in the Missouri part of the Waco district to their respective mills in the Kansas part; Eagle-Picher Mining & Smelting Co., operating mines and the Navy Bean mill in the Wentworth area; and American Zinc, Lead & Smelting Co., operating the newly developed Smith and Henckel mines near Duenweg after March and the Hunter mine and new 400-ton mill at Aurora after August. Cooley Bros. stripped overburden on the Sucker Flat property at Webb City from January to August and built a washing-concentrating plant designed to treat the type of ore found there. The plant consists chiefly of a large trommel screen, jigs, and tailing stackers; it began operating in September, making zinc-iron and lead concentrates which were shipped to the Ozark pigment plant at Coffeyville, Kans. Coarse rock that required crushing was stacked separately, and some of it was sent to custom mills.

The Playter mill at Waco, the St. Louis Mining & Milling Co. mill near Thoms Station, and the Southside near Joplin treated company and custom ores. Sizable custom-ore shippers included Glenn Richey at Smithfield, the Coble Mining Co. at Thoms Station, Miller & Ritter and the O'Jack Mining Co. near Joplin, and Fenix & Sons at Oronogo. The Northside mill near Joplin, the Fenix & Martin mill at Oronogo, and the Capital at Stotts City treated company ore. The Wentworth Mining & Milling Co. ran the Kline mine and mill from January to March. The Bureau of Mines did exploratory drilling on this property, on the Capital property at Stotts City, and on the Monark and Mary Arnold properties near Ozark. Brown & Root, as agent for the Metals Reserve Co., did 45,300 feet of churn drilling in the old Webb City field to check previous drill records and other data on ore reserves compiled in cooperation with the Bureau of Mines. The tailing-mill production came chiefly from the Missouri-Chitwood mill near Joplin and the Sciota at Webb City. Small mine or tailing mills near Neck City, Aurora, Diamond, Duenweg, Joplin, Ozark, and Webb City produced some sulfide concentrates. The zinc carbonate shipped from Newton County in 1943 totaled 783 tons averaging 40 percent zinc; it comprised concentrates from the new 250-ton Southwest mill at Stark City and a few cars of sorted lump ore from Granby. Some lower-grade carbonate was shipped from the Alice mine near West Plains.

OKLAHOMA

General details of mining and milling in the Tri-State region—which includes Northeastern Oklahoma—are given in the preceding pages on Southwestern Missouri. The Oklahoma area produced 57 percent of the total Tri-State output of both zinc and lead in 1943 compared with 62 percent of the zinc and 66 percent of the lead in 1942. Production of recoverable zinc decreased 22 percent from 1942 and lead 13 percent. Three unpredictable incidents impeded production in 1943. The first was destruction by fire in February of the Rialto No. 2 mill, shaft head frame, and compressor plant, with subsequent idleness at the Rialto No. 2 mine for about 3 months; the No. 2 mill was not rebuilt, but the company No. 3 mill was afterward run at capacity three shifts a day and handled the ore from all the Rialto mines. The second incident was the loss by fire of the Federal Gordon central mill in March, causing a shut-down of the five Federal Mining & Smelting Co. mines in Oklahoma (as well as the two in Kansas); two of the Oklahoma mines remained idle the rest of the year, but the others were reopened in June and shipped ore to Eagle-Picher mills. The third incident was the flooding May 18 of several large mines in the Cardin area by surface waters overflowing from Tar Creek and entering the mines through a caved shaft; pumping out required about 3 weeks.

Mine shipments of lead and zinc in Oklahoma, 1939–43

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1939	36, 422	$2, 189, 077	258, 214	$8, 937, 554	27, 720	$2, 605, 680	140, 379	$14, 599, 416
1940	27, 913	1, 656, 497	300, 984	12, 672, 186	21, 240	2, 124, 000	162, 935	20, 529, 810
1941	32, 628	2, 202, 876	307, 207	15, 427, 235	25, 021	2, 852, 394	166, 602	24, 990, 300
1942	29, 794	2, 985, 285	272, 209	19, 163, 622	22, 806	3, 056, 004	146, 510	27, 250, 860
1943	26, 423	3, 208, 885	[2] 213, 195	21, 251, 796	19, 733	2, 959, 950	114, 085	24, 642, 360

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[2] Includes 58 tons of zinc carbonate averaging 31.03 percent zinc.

Tenor of lead and zinc ore, old tailings, and slimes milled and concentrates produced in Oklahoma, 1942–43

	1942		1943	
	Crude ore	Old tailings and slimes	Crude ore	Old tailings and slimes
Total ore, etc., milled short tons	5, 012, 485	7, 785, 938	4, 779, 407	8, 880, 784
Total concentrates produced:				
Galena do	29, 371	423	26, 048	375
Sphalerite do	226, 302	45, 907	[1] 169, 380	43, 815
Ratio of concentrates to ore, etc.:

Average zinc content of zinc concentrates do	60. 11	58. 25	59. 76	58. 28
Average value per ton:				
Galena concentrates	$100. 52	$77. 86	$122. 26	$64. 55
Zinc concentrates	68. 54	79. 59	100. 76	95. 51

[1] Includes 58 tons of carbonate averaging 31.03 percent zinc.

[2] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin treated 3,762,266 tons of crude ore in 1943, of which 2,662,101 tons (71 percent) came from Oklahoma mines, compared with 3,599,087 tons in 1942, of which 2,905,220 tons (81 percent) came from Oklahoma. The principal Eagle-Picher mines in Oklahoma shipping to the mill were: Blue Goose mines, Crystal-Central, Goodeagle mines, Eagle-Picher Gordon No. 2, Grace Walker mines, Hum-bah-wat-tah mines, John Beaver No. 2, Netta, Niday No. 1, See Sah, and Southside mines; other large Oklahoma shippers to the mill were: Davis Big Chief Mining Co. (Skelton, Imbeau, Big Chief No. 3), M. & M. Mining Co. (Piokee, White, La Salle, Swift), Cameron & Henderson (Admiralty No. 2), F. W. Evans (Craig, Shorthorn), Mahutska Mining Co. (Acme-Blackhawk, Jeff City), Carpenter Mining Co. (Oko, New York), Lula Bell Mining Co. (Anna Beaver), and American Development Co. (Hunt). The Eagle-Picher 2,400-ton Bird Dog mill was reopened in February and served about 25 company and outside mines for various periods until November 1, when it began treating only ore from the Oronogo Circle open-pit mine in Missouri, other ores having been diverted to the Central mill.

ing Co. No. 1 mill handled custom ore from the M. & W. Mining Co. Brewster-Huttig and Ninety-Six Brewster mines, Dobson No. 4 mine, Pelican, Santa Fe, and others. The Mission mill received custom ore from various mines, including the Beck Mining Co. Muskogee, Kansas Explorations Lotson, and Mineral Products Swalley (in Kansas). The Guaranty mill was reconditioned by the Mutual Mining & Development Co. and operated as a custom plant about 2 months, mostly on ore from the Mary C. mine. The mine mills of the Jane E. Mining Co. (Scott mine), Kansas Explorations, Inc. (Ritz), Lawyers Lead & Zinc Co., Lula Bell Mining Co. (Farmington), and Weidman Mining Co. (Woodchuck and Townsite) treated company ore. Evans Wallower, Inc., ran its No. 7 mill on company mine dirt and its No. 4 mill on old tailings and some mine dirt. The St. Louis No. 4 mill operated one shift daily on mine dirt and ran an extra shift to remill old tailings on the property. The Romo mill was operated by the Romo Mining Co. on custom ore from the Craig lease until April 1, when the Romo mill, mining leases, and mine equipment were sold to Cameron & Henderson, who continued to mill the custom ore and also milled company ore from the reopened Nevins and Vallier mines at Lincolnville.

The United Zinc Smelting Corporation made an increased output of concentrates in 1943 from its Royal group of mines and mill; the mill treated ore, from the five company-operated shafts, and custom ore, mostly from the Dixie R (Lavrion) and Childress-Heggam mines. During the year the company began developing the Park Walton property 8 miles west of Picher. Drilling in the past on this and other properties in the Melrose area had not shown enough mineralization on a single property to justify the expense of unwatering the large area that would have to be drained before a shaft could be sunk. Therefore the Bureau of Mines and the Defense Plant Corporation participated in the Park Walton development; the Bureau unwatered the property through three large drill holes, and the Defense Plant Corporation advanced funds. Development to the end of the year consisted of a 349-foot shaft and about 125 feet of drifting on the 310-foot level. A test-mill run of the ore early in 1944 gave favorable results, and the company began sinking another shaft and preparing to build a mill.

All the large tailing mills in Oklahoma that were active in 1942 continued running throughout 1943; they comprised the Atlas, Big Chief, Britt & Britt, C. G. & C., Cardin Nos. 2 and 3, Semple (Martin), Tri-State Zinc Ottawa and Sooner, and Western.

From the Davis zinc district in Murray County, idle since 1917, the Arbuckle Mining Co. shipped 209 tons of ore in 1943 to a custom mill in the Tri-State district for a test run; the ore came from open pits on the old Sober-Hope property.

WISCONSIN

Lafayette, Iowa, and Grant Counties in Wisconsin contain the greater part of the Upper Mississippi Valley lead and zinc region, which extends from Wisconsin into Northern Illinois and Iowa; the

Iowa part has made no production since 1917. Activity in mining in the Wisconsin and Northern Illinois parts was stimulated by Government premiums paid for overquota production in 1942 and 1943. The total output of finished (smelting-grade) zinc concentrates increased from 20,601 tons in 1942 to 28,768 tons in 1943 and lead concentrates from 1,289 to 1,430 tons. The principal producer of finished concentrates continued to be the Vinegar Hill Zinc Co., which operated its custom mill near Cuba City on crude ore and zinc-iron-lead rougher jig concentrates purchased from operators throughout the active areas. The finished lead and zinc concentrates produced in 1943 were shipped to smelters outside the State, and the iron concentrates were used to make sulfuric acid in the company plant adjoining the mill. Besides the crude ore treated in 1943, the company bought about 26,000 tons for the Metals Reserve Co. stock pile; this ore is not included in the production for 1943 shown in the tables of this chapter but will be credited to that for the year in which the ore is reduced to concentrates of smelting grade.

Shipments to the mill from Northern Illinois in 1943 amounted to 14,006 tons of crude ore and rougher jig concentrates, averaging 10.29 percent zinc and 0.84 percent lead, of which a calculated 12,699 tons (including all the rougher jig concentrates) were reduced to finished concentrates during the year and yielded 1,152 tons of recoverable zinc and 74 tons of lead. The only other output from Northern Illinois was 10 tons of lead contained in concentrates sold to local buyers. The Wisconsin output, which includes finished concentrates produced at other flotation mills, is given in the tables that follow.

Shippers of Wisconsin rougher jig concentrates to the Vinegar Hill mill comprised the C. F. & H. Mining Co. (Mulcahy mine), Coughlin Mining Co. and its successor the Lucky Hit Mining Co. (Coughlin mine), Four S. & B. Mining Co., Liberty Mining Co., Little Benny Mining Co. (Monroe mine), New Birkett Mining Co. (also shipped crude ore), W. B. Baggaley (Kittoe tailing mill; also crude ore from the Rundell mine), and Wipet Mining Co. (Winskell concentrates and crude ore). The Little Benny Mining Co. also produced some finished concentrates in the company flotation mill erected during the year. The other principal Wisconsin shippers of crude ore to the Vinegar Hill mill were Baker & Deutman (Cleveland mine), Carter & Meloy (Leadmine), Cuba Mining Co. (B. A. T., Mulcahy No. 2), Curwin Mining Co., Deuce Mining Co., Gill Bros. (James), Meloy & Baker (Hoskins, Martin), P. M. Mining Co., Piquette Mining Co. (Trego), Roland J. Teske (McCabe), Thompson Mining Co., and Van Gorden Mining Co.

The Dodgeville Mining Co. operated its leased group of Dodgeville city lots and 150-ton jig and 50-ton flotation mill throughout 1943. Shortage of labor prevented capacity output. W. E. Faithorn operated his 600-ton jig and flotation mill at the Champion property at New Diggings on tailings from June through December. The Chestnut Hill Zinc Co. built a 200-ton table- and flotation-concentration mill at the Field property near Shullsburg and ran it on old tailings from July through December. The Bureau of Mines continued to make examinations and do sampling and exploratory drilling to assist zinc mine owners and operators in bringing their mines into production and to develop ore reserves for future need. Properties drilled included the Bickford at Mifflin; Coker at Livingston; Coughlin, Galena Level, and Winskell near Shullsburg; Crawford at Hazel Green; Homestead and Piquette near Platteville; McIlhon near Mineral Point; and Vial near Linden.

Mine production of lead and zinc in Wisconsin, 1939–43 [1]

Year	Lead concentrates		Zinc concentrates (sphalerite)		Metal content [2]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1939	567	$29,327	10,169	$355,915	388	$36,472	5,904	$614,016
1940	621	34,852	10,875	447,396	445	44,500	5,770	727,020
1941	1,639	111,014	11,685	594,323	1,225	139,650	6,238	935,700
1942	1,092	[3] 104,896	17,449	[3] 1,028,828	775	103,850	9,426	1,753,236
1943	1,307	[3] 111,360	26,632	[3] 1,624,858	920	138,000	14,387	3,107,592

[1] Most of the ore mined in Wisconsin from 1939–43 was first treated in gravity-concentration mills producing bulk concentrates which were re-treated by flotation.

[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ores and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[3] Most of the finished zinc concentrates and part of the lead concentrates produced in Wisconsin in 1942–43 came from a custom mill treating purchased crude ores and low-grade bulk concentrates on which premium payments had been made previously to mine operators; therefore, the value of these concentrates is calculated at market prices. Premium payments not reflected in the value of the finished concentrates amounted to about $399,000 in 1942 and $1,059,000 in 1943 for zinc and $18,500 and $40,600, respectively, for lead; part of these payments, however, were for ore which was stock-piled.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Wisconsin, 1942–43

	1942		1943

SUMMARY

Colorado mines yielded gold, silver, copper, lead, and zinc valued, in terms of recovered metals, at $19,205,415 in 1943 compared with $19,896,623 in 1942. Gold and silver together represented 35 percent of the total value in 1943 and 58 percent in 1942. Gold production in 1943 was the lowest in any year since 1876; production decreased 49 percent from 1942. The quantity of silver and copper produced decreased 14 and 7 percent, respectively; lead increased 19 percent and zinc 37 percent. The number of producing lode mines decreased from 311 in 1942 to 235 in 1943; the number of placer mines decreased from 68 to 17.

Premium payments for overquota production of copper, lead, and zinc were in force throughout 1943. Early in the year the Metals Reserve Co. issued a revised scale of premium payments and established three premium-price classes for zinc, designated A, B, and C. Because of the close affinity of lead and zinc in most ore bodies, lead was included in this plan; no change in premium-price set-up was announced for copper. Lead received one additional premium for the B class of 2¾ cents a pound above the 6½-cent-a-pound ceiling price and 2¾-cent-a-pound premium in effect throughout most of 1942. Zinc received two additional premiums of 2¾ cents each for the B and C classes above the 8¼-cent-a-pound ceiling price and 2¾-cent-a-pound A premium offered in 1942. On October 27, 1943, the War Production Board, in a sudden about-face of Government policy regarding subsidy of base-metal mining, announced that premiums in the B and C level for zinc would be denied mines not already operating and mines having a low productivity of zinc; premiums in the B level had already been denied lead mines. Establishing a future policy, the War Production Board also announced that the Government would not finance any new zinc projects. On November 9, 1943, the Board stated that no more applications for the special copper premium price under the plan effective since May 1, 1943, would be received after December 31, 1943. These actions of October 27 were prompted by increased mineral production, a greater need for labor than for large stock piles of ore of no immediate use, and revised metal requirements of the armed service.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Annual figures for the 5 years ended with 1943 and total production from 1858 are given in the table that follows. To the end of 1941 Colorado had produced more silver than any other State, but with the decreased output in 1942 and 1943 in Colorado Montana ranked first.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1939–43, and total, 1858–1943, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	758	583	1,914,593	366,852	$12,839,820	8,496,488	$5,767,313

Gold.—The mine production of recovered gold in Colorado was 137,558 fine ounces in 1943 compared with 268,627 ounces in 1942. Dry and siliceous ores yielded 86 percent of the State total gold; zinc-lead ore, 12 percent; and copper, lead, lead-copper, and zinc ores and small placer operations, 2 percent.

Silver.—The mine production of recovered silver in Colorado was 2,664,142 fine ounces in 1943 compared with 3,096,211 ounces in 1942. Dry and siliceous ores yielded 61 percent of the State total silver; zinc-lead ore, 34 percent; lead ore, nearly 5 percent; and copper, lead-copper, and zinc ores and small placer mines, nearly 1 percent.

Copper.—The output of recovered copper from mines in Colorado in 1943 was 2,056,000 pounds compared with 2,204,000 pounds in 1942. Dry and siliceous ores yielded 56 percent of the State total copper; zinc-lead ores, 32 percent; copper ore, 9 percent; and lead, lead-copper, and zinc ores, 3 percent.

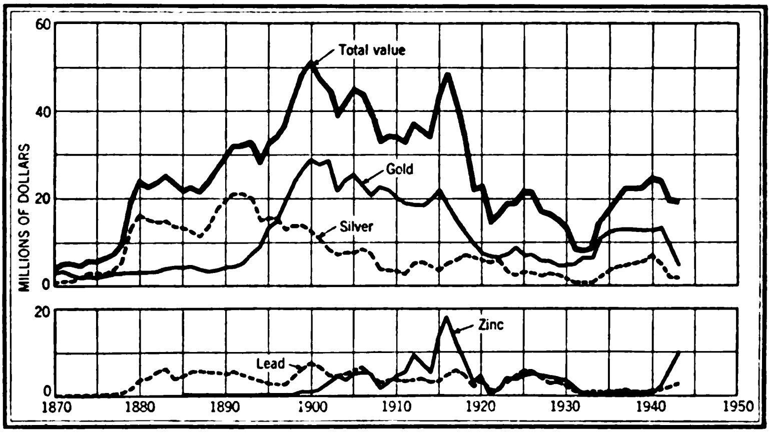

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1943. The value of copper has been less than $2,000,000 annually, except in a few years.

Lead.—The mine production of recovered lead in Colorado was 36,064,000 pounds in 1943 compared with 30,362,000 pounds in 1942. Zinc-lead ore yielded nearly 63 percent of the State total lead; dry and siliceous ores, 30 percent; lead ore, nearly 7 percent; and copper, lead-copper, and zinc ores, 0.1 percent.

Zinc.—The output of recovered zinc from mines in Colorado in 1943, largest since 1918, increased 37 percent in quantity over 1942. Zinc and zinc-lead ores yielded 95 percent of the State total zinc, and dry and siliceous ores nearly 5 percent. The principal zinc-producing districts in 1943, in order of output, were: Red Cliff (Battle Mountain), California (Leadville), Pioneer (Rico), Upper San Miguel (Telluride), Ten Mile (Kokomo, Robinson), Animas, Buckskin, Kerber Creek (Bonanza), Cotopaxi, Tomichi, Sneffels, Breckenridge, Griffith, and Roaring Fork (Aspen).

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

Except for the Cripple Creek district, virtually all the ores in Colorado districts—although chiefly valuable for gold and silver—contain some zinc, often discarded. A change in selection of ore and in metallurgy at many of the mines operating in the State in 1943 converted them into producers of zinc concentrates or products containing recoverable zinc. This conversion is shown clearly by comparison of the county and district tables for 1939 and 1943.

A serious labor shortage hampered virtually every mining operation in the State during 1943. The shortage of labor became so acute during the summer months that the Army authorized a plan to release a total of 4,500 soldier-miners from the Ninth Service Command for work in the copper, zinc, and molybdenum mines. This program began August 12, 1943, and approximately 1,000 soldiers were released each week thereafter until the full quota had been exhausted. Of this 4,500, Colorado mines received 269 men. Other factors that had a restraining influence on the mining industry of Colorado were the continuance of certain Government regulations, and of absenteeism at the larger producing mines, which particularly retarded production after paydays.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Colorado in 1943, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	885, 838	113, 936	540, 481	758, 684	7, 575, 505	3, 586, 697
Dry and siliceous gold-silver ore	30, 105	3, 152	112, 726	72, 178	894, 323	----------
Dry and siliceous silver ore	78, 883	625	975. 466	316, 906	2, 362, 600	408, 000
	994, 826	117, 713	1, 628, 673	1, 147, 768	10, 832, 428	3, 994, 697
Copper ore	3, 008	76	12, 107	184, 853	3, 269	----------
Lead ore	15, 291	2, 141	122, 305	29, 738	2, 513, 681	----------
Lead-copper ore	65	8	690	7, 559	8, 005	----------
Zinc ore	4, 378	68	7, 272	26, 533	24, 977	1, 138, 942
Zinc-lead ore	613, 750	17, 031	893, 005	659, 549	22, 681, 640	83, 054, 361
	636, 492	19, 324	1, 035, 379	908, 232	25, 231, 572	84, 193, 303
Total, lode mines	1, 631, 318	137, 037	2, 664, 052	2, 056, 000	36, 064, 000	88, 188, 000
Total, placers	----------	521	90	----------	----------	----------
	1, 631, 318	137, 558	2, 664, 142	2, 056, 000	36, 064, 000	88, 188, 000
Total, 1942	1, 797, 386	268, 627	3, 096, 211	2, 204, 000	30, 362, 000	64, 430, 000

METALLURGIC INDUSTRY

Total ore sold or treated in Colorado was 1,631,318 tons in 1943 compared with 1,797,386 tons in 1942. The quantity of zinc-lead ore sold or treated increased from 577,162 to 613,750 tons; dry and siliceous ores decreased from 1,212,986 to 994,826 tons; and copper ore increased from 208 to 3,008 tons, lead ore from 6,418 to 15,291 tons, and zinc ore from 590 to 4,378 tons.

Direct smelting ore comprised 3 percent of the State total output of ore in 1943 as in 1942. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the gold, silver, and gold-silver-lead-copper ore and concentrates shipped to smelters during the year. Ore treated at concentrating plants comprised 48 percent of the State total output of ore; and ore treated at amalgamation and cyanidation mills, including those with concentration equipment, 49 percent. Of the ore treated at concentrating plants 476,844 tons were zinc-lead ore, 221,033 tons dry gold ore, and 58,821 tons dry silver ore.

The destination and treatment of concentrates and ore produced by operators in the State are discussed in the following review by counties and districts.

Figures for the quantity of gravel handled at the 17 small placer mines worked in 1943 are not available.

Mine production of metals in Colorado in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated [1]	650, 601	27, 670	10, 245			
Ore, concentrates, sands, and slimes cyanided [2]	[3] 280, 441	38, 636	14, 413			
Concentrates smelted	154, 381	66, 108	2, 402, 438	1, 642, 243	32, 508, 705	88, 138, 094
Ore smelted	42, 629	4, 623	236, 956	413, 757	3, 555, 295	49, 906
Placer [1]		521	90			
		137, 558	2, 664, 142	2, 056, 000	36, 064, 000	88, 188, 000
Total, 1942		268, 627	3, 096, 211	2, 204, 000	30, 362, 000	64, 430, 000

[1] Quicksilver used by amalgamation mills was 1,384 pounds. Placer mines used approximately 10 pounds.

[2] Cyanide (in terms of 96 to 98 percent NaCN) used was 332,806 pounds.

[3] Comprises 228,534 tons of sands and slimes from ore first roasted and amalgamated, 50,118 tons of selective-flotation tailings, and 1,789 tons of flotation concentrates.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Colorado in 1943, in terms of recovered metals

ADAMS COUNTY

Gold and silver were recovered as byproducts during 1943 from the gravel-washing plant of the Brannan Sand & Gravel Co. on Clear Creek north of Denver.

BOULDER COUNTY

Central (Jamestown) district.—All of the copper and lead and most of the gold and silver produced in the Central district in 1943 were recovered as byproducts of fluorspar mining. The General Chemical Co. mined fluorspar from its claims near Jamestown throughout the year and also shipped a small quantity of gold ore from surface dumps on the Invincible claim to the Golden Cycle mill during the first part of the year. The Argo, Brown Spar, and Emmett mines were operated by H. M. Williamson & Son for the production of fluorspar; lead-silver concentrates recovered from the milling of the fluorspar were shipped to the Leadville smelter. Operators on the Black Rose group and the New Rival shipped small lots of gold ore to the Golden Cycle mill.

Gold Hill district.—The production of gold from the Gold Hill district in 1943 decreased 94 percent from 1942. Only 5 mines were in operation compared with 15 in 1942. Lessees worked the Gardner mine, leading producer in 1943, and shipped zinc-lead ore containing 35,798 pounds of zinc, 24,571 pounds of lead, 619 ounces of silver, and 261.46 ounces of gold to the Golden Cycle mill at Colorado Springs. Other mines which shipped ore to the Golden Cycle mill were the Sunshine and Home Sweet Home.

Grand Island district (Nederland).—The only base-metal mine in operation in the Grand Island district in 1943 was the Blue Bird, worked by the Great Western Silver Mines Corporation; lead-silver-gold-copper concentrates were shipped to the Leadville smelter.

Sugar Loaf district.—All the base-metal ore produced from the Sugar Loaf district in 1943 was shipped to the Golden Cycle mill. The Poorman group was operated continuously by lessees until September and again was the largest producer of gold in the district. The largest producer of silver was the Nancy mine, operated throughout the year by the Hard Rock Mining Co. of Boulder. Most of the mining operations in this district and in the Grand Island district in 1943 were carried on to recover tungsten.

Ward district.—The Boston and Utica mines were operated the entire year by the Ward United Mines Co. and were the leading producers of gold and copper in Boulder County in 1943. Crude smelting ore containing 739 ounces of gold, 802 ounces of silver, and 14,277 pounds of copper was shipped to the smelter at Leadville. The company 25-ton concentration-flotation mill operated only 3 months during the year on low-grade ores from the mine. Small tonnages of ore and concentrates were shipped to the Leadville smelter and the Golden Cycle mill from the Columbia, Golden Casket, and Black Jack mines.

CHAFFEE COUNTY

Granite district.—The production from the Granite district in 1943 came from the Gold Basin placer, operated from July to October by Len Savage and John D. Howard.

Monarch district.—Production from lode mines in Chaffee County in 1943 was restricted to the Monarch district. The Hawkeye mine, operated under lease from Burleson Bros., was the leading producer. Lead ore, averaging 17 percent lead and 6 percent zinc, was shipped to the Leadville smelter. Burleson Bros. operated the Alaska mine under lease and shipped zinc-lead ore to the Golden Cycle mill for treatment.

CLEAR CREEK COUNTY

Argentine district.—The largest operation in the Argentine district was that of O. Barlow Wilmarth on the National, Sussex, and Newcastle claims in Grizzly Gulch 8 miles southwest of Georgetown. Zinc-lead sulfide ore produced was concentrated at the Chicago Creek custom mill; the bulk concentrate was shipped to the Midvale (Utah) custom concentrator for further treatment. Other producers included the Gold Belt, Hamill Tunnel, Sidney, and Stevens mines.

Empire district.—Minnesota Mines, Inc., largest producer of gold in Clear Creek County in 1943, operated continuously its Crown Prince group of mines and 250-ton (daily) flotation-cyanidation mill until June 5, when the mine and mill were shut down. A shortage of labor was the deciding factor in the closing of the property. (See Minerals Yearbook, 1941, p. 301, for method of ore treatment.) A. H. Stone operated the Omaha mine during the latter part of the year and shipped 17 tons of zinc-lead sulfide ore to the Golden Cycle mill at Colorado Springs.

Griffith district.—The largest producer of zinc, lead, and silver in the Griffith district and in Clear Creek County was the Mile High Mining Co., which operated the Smuggler mine and Silver Leaf mill near Silver Plume continuously in 1943. Zinc and lead concentrates were produced and shipped to the Amarillo (Tex.) and Leadville smelters. Operators at the Scotia and Mendota properties made small shipments of bulk concentrates to the Midvale (Utah) smelter. The Golden Cycle Corporation leased the Dives-Pelican mine at Silver Plume during the summer and shipped stope-fill material to its mill at Colorado Springs; other properties in the Griffith district which shipped zinc-lead sulfide ore to the Golden Cycle mill were the Dunbarton, Mendota, Frostberg, and Diamond.

Idaho Springs district.—Virtually all the ore mined from the 13 producing properties in the Idaho Springs district in 1943 was milled in custom mills in the district or at Colorado Springs. Custom mills active during the year, most of them operating only intermittently, included the Clear Creek-Gilpin Co., Ruth, Chicago Creek, and Silver Spruce. The Golden Cycle mill at Colorado Springs received ore shipments during the year from the Idaho Bride, Freighter's Friend, Humboldt, East Lake, Bald Eagle, and Silver Age properties. A clean-up of the Alma Lincoln Mining Co. 150-ton flotation mill produced 73 tons of bulk concentrates shipped to the Leadville smelter and a small quantity of bullion shipped to the Denver Mint. Crude smelting ore was shipped to the Leadville and Tooele (Utah) smelters from the Oregon, Bald Eagle, Idaho Bride, and Salisbury mines.

Montana district.—Production from the Montana district in 1943 comprised 2,747 tons of zinc-lead sulfide ore from the Joe Reynolds and 128 tons of lead ore from the Red Elephant group.

Trail Creek district.—The Harrison Croesus Mining Co. operated the Ben Harrison and Croesus claims on Trail Creek 4 miles southwest of Idaho Springs from March 29 to December 15, 1943. Zinc-lead sulfide ore totaling 991 tons was milled at the Clear Creek-Gilpin Co.

and Silver Spruce mills. Concentrates produced were shipped to the Leadville and Tooele (Utah) smelters. In operation until July 17, Lamartine Mines, Inc., produced 7,921 tons of dry gold ore from which were recovered 391 tons of lead concentrates containing 635 ounces of gold, 6,665 ounces of silver, 2,605 pounds of copper, and 62,025 pounds of lead. A clean-up of the Freeland mill yielded 2 tons of material containing 2 ounces of gold and 7 ounces of silver.

CUSTER COUNTY

Hardscrabble district.—The Lady Franklin mine near Westcliffe, largest producer of gold, silver, lead, and zinc in Custer County in 1943, was operated continuously throughout the year and shipped 4,200 tons of ore averaging 5.6 percent zinc and 3 percent lead to the Golden Cycle mill in Colorado Springs. Other producers in the district, all shipping crude ore to the Golden Cycle mill or to the Leadville smelter, were the Defender, Keystone, New Hope, and Passiflora mines.

Ilse district.—The only production from the Ilse district was two small shipments of lead ore averaging 55 percent lead from the Terrible mine. The mine was reopened in 1942 by G. E. Devereaux with the aid of a loan from the Reconstruction Finance Corporation but was closed again in the latter part of 1943.

DOLORES COUNTY

Pioneer district (*Rico*).—The Rico Argentine Mining Co. operated its group of mines and 135-ton selective-flotation mill continuously in 1943 and milled 33,618 tons of ore averaging 16 percent zinc and 10 percent lead. The products of the mill were lead-silver concentrates (carrying some copper, zinc, and a little gold) shipped to the Leadville smelter and zinc concentrates (carrying also silver, lead, copper, and a little gold) shipped to the Amarillo (Tex.) smelter. The zinc concentrates averaged 51.8 percent zinc and the lead concentrates 64.2 percent lead. Markey Bros. and John Lill operated the Yellow Jacket group during the year and shipped crude zinc-lead ore (carrying some silver, copper, and a little gold) to custom mills in Utah.

EAGLE COUNTY

Red Cliff district (*Battle Mountain*).—The Red Cliff district again ranked first among Colorado districts in output of zinc but dropped to third place in output of copper. The New Jersey Zinc Co. Empire Zinc Division Eagle mine and mill at Gilman were operated continuously in 1943. The company mined and shipped less copper-iron-silver-gold sulfide smelting ore than in 1942 but increased the output of zinc-lead milling ore. The production of zinc from Eagle County was the largest in the history of the county.

EL PASO COUNTY

GOLDEN CYCLE MILL

The Golden Cycle custom mill at Colorado Springs recovered 34 percent of the total Colorado output of gold from lode mines in 1943. It treated 287,939 tons of ore, compared with 378,434 tons in 1942. Of the total ore treated 226,908 tons were gold-[silver]-sulfotelluride ores from the Cripple Creek district (Teller County), and 61,031 tons comprised miscellaneous zinc-lead, gold, and gold-silver ores from other districts in the State, mainly in Summit, Lake, Clear Creek, Custer, Fremont, Saguache, Boulder, Chaffee, Gilpin, and San Juan Counties. As ores purchased vary in character and grade, the metallurgy is not always the same. Ores from Cripple Creek (comprising most of the mill feed) are roasted, amalgamated,[1] and cyanided. Complex ores containing base metals are treated by selective flotation; the tailings from this operation are separated into sand and slimes and cyanided.

Although milling at Colorado Springs was curtailed immediately following the War Production Board Gold Mining Limitation Order of October 1942, the mill was permitted to continue operations in 1943 under several reprieves granted by the War Production Board. Provisions of the first reprieve, issued December 3, 1942, allowed operation until June 8, 1943, and called for conversion of a 300-ton unit of the company milling plant to selective flotation to handle 450 to 500 tons of zinc-lead ore per day. Treatment of dry gold ore from Cripple Creek and Boulder County was permitted because this type of ore was needed in the milling plant. Conversion of the flotation unit to selective flotation was completed the latter part of April 1943. The first shipments of zinc and lead concentrates were made the latter part of May. A further reprieve of indefinite duration was granted August 8, 1943.

FREMONT COUNTY

Cotopaxi district.—The Monarch Galena Co. operated the Cotopaxi mine in the Cotopaxi district throughout 1943 and shipped 3,284 tons of zinc ore (containing some gold, silver, and copper) to the Golden Cycle mill and Midvale (Utah) custom concentrator.

Grape Creek district.—The Horseshoe mine 9 miles southwest of Canon City was operated by Christison & Van Buskirk the last 5 months of the year. Zinc-lead ore (1,576 tons) averaging 6.8 percent zinc and 4 percent lead was sent to the Golden Cycle mill.

GILPIN COUNTY

Southern districts (Blackhawk, Central City, Nevadaville, Russell Gulch).—Eighteen lode and 4 placer mines were active in the Southern districts in 1943. The output of silver, lead, and zinc from Gilpin County increased in 1943, whereas the output of gold decreased 74 percent and that of copper 22 percent. The Widow Woman mine (largest producer of silver, lead, and zinc in the county) was operated the entire year by the G. S. & G. Mining Co. Zinc-lead sulfide ore (carrying some gold, silver, and copper) was shipped to the Golden Cycle mill for treatment. The Pittsburg-Notaway group of mines and 100-ton flotation mill (largest producer of gold in the county) were operated continuously under lease by Kingmill Mines, Inc., until October 27, when the mine and mill were shut down indefinitely. V. C. Lasswell worked the Anchor mine during 9 months of the year and sent ore to the Clear Creek-Gilpin mill at Idaho Springs (Clear Creek County) for treatment. The Powers and Hope claims (largest producers of copper in Gilpin County) were operated throughout the year by the Lu Ev Mining Co.; copper ore and concentrates were shipped to the Garfield (Utah) smelter. Lessees operated the Gold Cup mine and sent crude ore to the Clear Creek-Gilpin and Golden Cycle mills. Ore was also shipped to the Golden Cycle mill from the Banta Hill, Boodle, Bullion, Justice, West Notaway, Tariff, and Washington Day mines.

---

[1] Free gold saved on lightweight canton-flannel blankets and amalgamated in iron arrastre.

Small-scale placers worked with screening and sluicing plants in 1943 included the Packard, Morgan, Peerless, and Russell Gulch.

GRAND COUNTY

A small shipment of silver ore was sent to the Golden Cycle mill from the Ready Cash mine near Jones Pass.

GUNNISON COUNTY

Elk Mountain district.—Lessees on the Cincinnati mine made one shipment to the Tooele (Utah) concentrator of zinc-lead-gold-silver ore which had been hand-sorted from the dump.

Quartz Creek district.—An operator on the Complex mine near Pitkin shipped a small quantity of lead ore assaying 24 percent lead to the smelter at Leadville.

Taylor Park district.—In 1943 the Star and Thunderbird mines produced, respectively, 197 and 22 tons of ore (containing zinc, lead, copper, silver, and gold) which were shipped to the Midvale (Utah) custom mill.

Tomichi district.—The Callahan Zinc-Lead Co., Inc., operated the Akron mine throughout 1943. Zinc-lead-silver ore (3,941 tons) was shipped to the Midvale (Utah) custom mill and the Leadville smelter.

HINSDALE COUNTY

Galena district.—The Base Metal Corporation operated under lease the Ute and Ulay group and 100-ton (daily) selective-flotation mill from April through October and produced lead concentrates averaging 60.1 percent lead and zinc-lead concentrates averaging 57 percent combined zinc and lead.

JEFFERSON COUNTY

Two shipments of ore of small content in gold, silver, copper, lead, and zinc were sent to the Golden Cycle mill by a lessee on the Blackmer ranch near Evergreen. This was the only lode operation in Jefferson County in 1943. The bulk of the placer gold and silver produced during the year was recovered from the Tresize placer by W. B. Kerkling and as a byproduct from the gravel-washing plants of the Superior Sand & Gravel Co.

LAKE COUNTY

CALIFORNIA (LEADVILLE) DISTRICT

The American Smelting & Refining Co. operated its Arkansas Valley lead bullion-leady copper matte smelter continuously (one furnace) in 1943 on ores and concentrates purchased from operators in virtually every mining district in Colorado. Receipts of ore and concentrates totaled 80,433 tons, compared with 94,659 tons in 1942.

The Resurrection Mining Co. operated the Resurrection mine and 300-ton selective-flotation mill continuously throughout 1943. The company treated 105,765 tons of zinc-lead sulfide ore from the Resurrection mine and 418 tons of custom ore from six operators in Summit County. Early in the year the company began construction of a 500-ton addition to the milling plant. This addition was not completed and put into operation until January 1944. Development during 1943 included 76 feet of inclined winze, 5,813 feet of drifts, 1,045 feet of raises, and 872 feet of diamond drilling. In addition to the milling ore produced the company shipped 3,351 tons of lead oxide ore to the Arkansas Valley smelter. Combined zinc-lead-gold-silver concentrates produced totaled 16,212 tons, containing 8,709 ounces of gold, 151,306 ounces of silver, 6,022,457 pounds of lead, and 9,384,130 pounds of zinc. Lead concentrates were shipped to the Leadville smelter; zinc concentrates were shipped to Amarillo, Tex. To provide living accommodations for its employees, the company constructed a 32-family housing unit on the south side of California Gulch.

The California Gulch Mining & Milling Co. operated its two gravity- and flotation-concentration and amalgamation mills—one 75- to 125-ton capacity and one 450-ton capacity—throughout the year on ores from the Ibex, Valley, and Fortune mines and the Robert Emmett, Mab, Colonel Sellers, and Wolftone dumps. Early in 1943 the company completed the conversion of its large mill to the recovery of lead and zinc. A washing plant and a set of truck scales were installed at the mill during 1943. The John Hamm Mining & Milling, Ltd., operated its 300-ton amalgamation-gravity concentration-flotation mill the entire year on ore from the Ibex and Fanny Rawlings dumps. Construction of a 600-ton jig plant to rough-concentrate zinc-lead dump ores was in progress during the latter half of the year. The jig plant was not put into steady operation until early in 1944, when the company closed its 300-ton flotation plant.

The first Heavy-Media separation plant to be constructed in Colorado and the first in the country to use a ferrosilicon medium in the bulk concentration of nonferrous metal ores began production on July 28 when the Ore & Chemical Co. completed its 1,000-ton mill 1½ miles west of Leadville. The mill, built primarily to treat old dump material in the Leadville district, operated the remainder of 1943 on ore from the South Moyer dump in California Gulch. The ore is crushed to 1¼-inch size and deslimed, and the oversize is screened to make a separation at 10-mesh. Oversize is fed to a differential density cone containing a ferrosilicon medium of 3.00 specific gravity. The higher gravity of the ore makes the recovery of the bulk concentrate possible as a sink product; the float material is discarded as waste. Undersize is fed to a two-cell placer jig, the tailings of which go to waste. Concentrates from the cone and jigs are shipped to the Golden Cycle mill at Colorado Springs for further concentration.

The Golden Cycle mill at Colorado Springs also treated ore from the Fortune and Little Johnny mines. The principal shippers of smelter ore to the Leadville smelter and smelters in Utah (in approximate order of tonnage) were the Rock and Dome, Wolcott dump, Ibex, Flagstaff dump, New Monarch, Breece dump, Dolly B, Gallagher, Golden Eagle, Adelaide, Little Ellen, and Valley.

In June 1943, Congressional action made available $1,400,000 appropriated for the construction of a 2.55-mile tunnel to unwater the mines of the Carbonate Hill, Evans Gulch, and Fryer Hill areas north and east of Leadville and the Downtown area within the city. It is anticipated that this tunnel will drain 65 to 90 percent of the mine water of the Leadville area above the 9,950-foot tunnel level. Actual tunnel driving was not begun until December 7, 1943.

LA PLATA COUNTY

California (or La Plata) district (Hesperus, La Plata).—The metal output from the California district in 1943 was from small shipments of ore from the Bessie G and Bunny mines to the Midvale (Utah) smelter. Lessees made a shipment of dump ore to Leadville from the old American Smelting & Refining Co. smelter dump at Durango.

MINERAL COUNTY

Creede district.—The Emperius Mining Co. operated its 100-ton flotation mill the entire year on ore from the Amethyst, Equinox, New York, Last Chance, Volunteer, Pittsburg, and Happy Thought mines. Lead-silver-gold concentrates produced were shipped to the smelter at Leadville. The company also shipped crude lead-silver ore direct to the Leadville smelter from the Amethyst, Commodore, Pittsburg, Happy Thought, and Robinson mines. The Ridge Leasing Co. operated the Ridge mine the last 6 months of 1943 and shipped zinc-lead milling ore (carrying some gold and silver) to the Tooele (Utah) concentrator. The production of silver from the Creede district decreased 22 percent from 1942.

MONTROSE COUNTY

La Sal district.—The New Cashin Mines, Inc., operating the Cashin group, shipped copper fluxing ore averaging 3.2 percent copper to the Garfield and Tooele (Utah) smelters. A 3¼-mile access road to this property was constructed by the Federal Grazing Service to facilitate the moving of ore to the smelter.

San Miguel River (Naturita) district.—Individuals sluicing on the San Miguel River recovered small lots of placer gold in 1943.

OURAY COUNTY

Red Mountain district.—Seven mines were producing in the Red Mountain district in 1943. Among the larger operators were Wm. McCullough, who shipped dump ore from the Mountain King mine to the General Ore Reduction mill, and the Denver Engineering Co., which operated the San Antonio mine through the Koehler tunnel at the top of Red Mountain Pass and shipped crude zinc-lead ore to the Midvale (Utah) custom concentrator. Other producers shipping ore to the General Ore Reduction Co. mill and to the Midvale (Utah) mill were the Beaver-Belfast group and the Red Mountain, Barstow, and Kentucky Giant mines.

Sneffels district.—The Camp Bird mine and 100- to 125-ton amalgamation-flotation mill, under lease to King Lease, Inc., were operated continuously in 1943 through the 11,000-foot crosscut tunnel. (See Minerals Yearbook, 1941, p. 308, for methods of ore treatment.) The mine was the largest producer of gold, silver, copper, lead, and zinc in Ouray County in 1943. Zinc-lead-silver ore totaling 309 tons was shipped to the General Ore Reduction Co. custom mill from the Agnes, Camp Bird Extension, Monument, Revenue, and Yankee Boy mines, *Uncompahgre district.*—The General Ore Reduction Co., successor to G. A. Franz, Inc., remodeled the old Banner American mill and purchased ores in 1943 from Ouray and San Juan Counties. During the year 1,314 tons of ore were milled, averaging 0.02 ounce of gold and 5.0 ounces of silver to the ton, 0.2 percent copper, 6.0 percent lead, and 3.8 percent zinc. Lead-silver-zinc concentrates were shipped to the Midvale (Utah) mill and smelter. The McCullough Lease treated old mill tailings from the Wanakah dump and shipped the product to the Midvale (Utah) smelter. The Bachelor Consolidated group of claims, under lease to Julius Sonza, was worked continuously in 1943. Zinc-lead-silver ore was produced and sent to the General Ore Reduction Co. mill for treatment. Other mines operating in the Uncompahgre district in 1943 were the Highland Chief and the Michael Breen.

PARK COUNTY

Alma Placers district.—H. J. McLaughlin worked the Alma Placers in 1943 and shipped two small lots of gold amalgam to the Denver Mint.

Buckskin district.—The Buckskin Joe Mines, Ltd., operated the Phillips group of mines in Buckskin Gulch and the Alma-Betts 65-ton selective-flotation mill in Mosquito Gulch throughout 1943. The products of the mill were zinc, lead, and iron concentrates. Lessees on the Red Cross and the Sweet Home mines shipped crude zinc-lead ore to the Golden Cycle mill for treatment.

Consolidated Montgomery district.—The Magnolia Gold Mining Co. operated the Lee Goss lode from April through December 1943 and produced 700 tons of zinc-lead ore (carrying some gold, silver, and copper), which were shipped to the Golden Cycle mill for treatment. A small tonnage of crude ore containing gold, silver, and lead was shipped to the smelter at Leadville. The company 50-ton flotation mill in Montgomery Gulch was not operated in 1943. Two small shipments of crude lead-silver ore were made to the Leadville smelter from the Mineral Park mine.

Fairplay district.—One small sluicing operation on the Snowstorm placer 2 miles north of Fairplay was the only activity in the Fairplay district in 1943. All dredging was at a standstill the entire year.

Mosquito district.—The London Mines & Milling Co. operated its consolidated group of mines on London Mountain and 200-ton flotation mill on South Mosquito Creek continuously until October 20, when operations were discontinued; the mill and other equipment were sold. Dry gold concentrates (carrying also silver, copper, and lead) were sold to the Leadville smelter. The mine was the largest producer of gold, silver, and lead in Park County in 1943. The Orphan Boy mine was worked throughout most of the year, and shipments of zinc-lead sulfide ore were made to the Golden Cycle mill. Clean-up at the London Butte Gold Mines Co. mines yielded concentrates that were sold to the Leadville smelter.

Pulver district.—The Great Western mine on Wilkerson Pass 10 miles west of Lake George was operated the last 6 months of the year by O. N. Sandholm. Zinc ore averaging about 7 percent zinc was sent to the Golden Cycle mill for treatment.

PITKIN COUNTY

Roaring Fork district (*Aspen*).—The Midnight Mining Co. operated the Midnight mine and 50-ton flotation mill on Richmond Hill continuously 6 days a week in 1943. The mine produced 12,122 tons of silver-lead-zinc ore averaging 30.6 ounces of silver to the ton, 3.3 per cent lead, and 5 percent zinc. The products after milling were silver-lead concentrates, sent to the Leadville smelter, and zinc concentrates, sent to Amarillo, Tex. D. P. Rohlfing and his successors (after his death) continued to ship from the Aspen Leases to the Leadville smelter lime fluxing material carrying silver and lead. Herron Bros. treated about 3,000 tons of silver-lead-zinc-bearing material from the Henry Clay dump in the company mill north of Aspen and shipped silver-lead concentrates to the Leadville smelter and zinc-lead concentrates to the Golden Cycle mill for further treatment.

RIO GRANDE COUNTY

Summitville district.—The Gold Links Mining Co., working the Little Annie Group of mines the entire year, was the only producing company in the county in 1943. The mine produced 3,350 tons of ore, which were treated at the company 50-ton stamp (10 stamps) and flotation mill. In addition to amalgamation bullion, which was shipped to the Denver Mint, the mill produced 260 tons of copper concentrates containing 1,861 ounces of gold, 1,366 ounces of silver, and 19,036 pounds of copper.

ROUTT COUNTY

Milbank Franz shipped 355 tons of zinc ore containing 2.78 ounces of gold, 534 ounces of silver, 4,437 pounds of copper, 12,601 pounds of lead, and 91,555 pounds of zinc from the Greenville mine in the Hahns Peak area to custom mills in Utah.

SAGUACHE COUNTY

Kerber Creek district (Bonanza).—The 1943 production of gold, copper, and zinc in the Kerber Creek district increased over that in 1942. The largest output came from the Bonanza mine dump and the Erie mine. Brugger & Keserich worked the Bonanza dump from March through December and made regular shipments to the Golden Cycle mill. Crude ore was shipped to the custom concentrator at Midvale (Utah) and the Leadville smelter from the Erie mine, operated throughout 1943 by Pickering and Olive Mines. The Pratt-Bonanza Mining & Milling Co. operated the St. Louis mine under lease throughout the year and shipped crude zinc-lead milling ore to the Combined Metals Reduction Co. custom mill at Bauer, Utah. The ore shipped averaged 4.1 ounces of silver to the ton, 6.4 percent lead, and 13.5 percent zinc, as well as a low content of gold. Lessees on the Rawley No. 1 mine shipped lead-silver-copper-gold ore to the Leadville smelter and zinc-lead ore to the Golden Cycle mill. Other producers of ore sold to the Golden Cycle mill were the Warwick and Silver Creek mines and the Cocomongo dump.

SAN JUAN COUNTY

Animas district.—The Shenandoah-Dives Mining Co. continued to operate as a single unit its consolidated group of claims on King Solomon Mountain and the Silver Lake group leased from the American Smelting & Refining Co. The ore mined was milled in the company 700-ton selective-flotation mill on the Animas River near

Silverton. The lead and zinc concentrates produced contained 17,498 ounces of gold, 165,515 ounces of silver, 431,134 pounds of copper, 1,901,761 pounds of lead, and 777,282 pounds of zinc; the lead-copper and iron (lead) concentrates were shipped to the Leadville smelter and the zinc concentrates to the smelter at Amarillo, Tex. Custom ore milled at the company mill came from 14 mines in the Animas, Eureka, and Ice Lake districts. Development in 1943 at the Silver Lake and Shenandoah-Dives groups consisted of 2,640 feet of drifts, 191 feet of raises, and 286 feet of diamond drilling. The Highland Mary group of mines and 70-ton flotation mill in Cunningham Gulch were operated from June to November, when operations ceased owing to severe winter weather and snow slides. Concentrates from this property were shipped to the Leadville smelter. The Denver Equipment Co. operated the 100-ton Pride of the West selective-flotation mill at Howardsville continuously in 1943 on company ore from the Pride of the West group. The ore milled averaged 0.069 ounce of gold and 3.5 ounces of silver to the ton, 5.5 percent lead, and 1.3 percent zinc. Lead concentrates averaging 63.5 percent lead were shipped to the Leadville smelter; zinc concentrates averaging 54.6 percent zinc were shipped to the Amarillo (Tex.) smelter. Other mines shipping ore to the Shenandoah-Dives custom mill or the Golden Cycle mill at Colorado Springs were the Belcher, Henrietta, Lark, Little Fannie, Little Ida, Mogul, and Little Nation.

Eureka district.—Most of the ore produced at mines in the Eureka district in 1943 was sold either to the Shenandoah-Dives or the Golden Cycle mill. The largest producers, in order of output, were the Mountain Queen mine (operated from August to November by the Mountain Queen Lease) and the Columbus and London mines. One shipment of zinc-lead ore went to the custom mill at Bauer (Utah) from the Columbus mine.

Ice Lake Basin district.—The only output from the Ice Lake Basin district in 1943 was 64 tons of zinc-lead ore shipped to the Shenandoah-Dives mill from the Bandora mine near the head of South Mineral Creek.

SAN MIGUEL COUNTY

Upper San Miguel district (Telluride).—Telluride Mines, Inc., operated throughout 1943 its 550-ton amalgamation and gravity- and flotation-concentration mill at Pandora 2½ miles east of Telluride and treated 145,036 tons compared with 146,211 tons in 1942. The ore treated in 1943 came from the Smuggler Union, Cimarron, and Montana mines in the Telluride district and from the Humboldt mine in the Sneffels district of Ouray County. Development consisted of 42 feet of raises and 532 feet of drifts. Alta Mines, Inc., continued to operate the Alta-St. Louis group and 100-ton gravity- and flotation-concentration mill throughout the year but with decreased production due to lack of men. A small quantity of bullion recovered by amalgamation was shipped to the Denver Mint from the Allegheny and Telluride claims.

On the strength of a favorable report by the district engineer of the Federal Bureau of Mines at Denver, the Metals Reserve Co. arranged with the Idarado Mining Co. on June 11, 1943, to lease the Black Bear property in Ingram Basin on the Telluride side of Columbia Mountain. A loan of $1,300,000 was obtained from the Reconstruction Finance Corporation to reopen and develop the mine.

A contract was granted to extend the Treasury tunnel (Red Mountain district, Ouray County) (already in 5,539 feet) another 6,300 feet to a point beneath the old Black Bear workings and to raise approximately 1,100 feet to connect the tunnel level with the No. 6 level of the Black Bear. Actual tunneling was begun on July 13, and on October 16 the Black Bear vein was intersected. After some delay, to decide whether or not the vein would be prospected at once from this junction, the contractor was instructed to drive ahead as originally planned to a point beneath the old Black Bear shaft. This point was reached early in 1944, and after several crosscuts had been driven to explore the ore body it was decided not to drive the raise but to develop the vein from the Treasury tunnel level. The Sunshine Mining Co. of Idaho was appointed as agent for the Metals Reserve Co. to operate the mine, and at the present date (June 13, 1944) the development program is progressing satisfactorily. The 250-ton mill at the portal of the tunnel probably will be expanded to 500 tons daily capacity.

SUMMIT COUNTY

Breckenridge district.—The largest operation in the Breckenridge district in 1943 was the Golden Cycle Corporation lease on the Monte Cristo mine near the summit of Hoosier Pass. Work at the property was begun in June 1943, and after necessary mining equipment had been installed shipments were started in July to the Golden Cycle mill at Colorado Springs. From June to December 10, when operations ceased owing to winter weather conditions, 11,217 tons of low-grade zinc-lead sulfide ore were produced. Other properties from which crude milling ore was shipped to the Golden Cycle mill were the Country Boy mine and Wellington dump. Several cars of crude smelting ore were shipped to the Leadville smelter from the Button and Minnie B mines. Milling ore totaling 56 tons and averaging 25 percent zinc and 5 ounces of silver to the ton was shipped from the Sally Barber mine to the Midvale (Utah) custom concentrator.

Green Mountain district.—Walter McDaniel continued producing zinc-silver-lead-gold-copper ore from his Big Four mine on Green Mountain 17 miles south of Kremmling. The output in 1943 was 510 tons of ore (shipped to custom mills in Utah) containing 286,664 pounds of zinc, 5,561 ounces of silver, 5,492 pounds of lead, 14.80 ounces of gold, and 1,360 pounds of copper.

Montezuma district.—Properties in the Montezuma district from which zinc-lead sulfide ore was trucked to the Resurrection Mining Co. mill at Leadville were the Burke group, New York, Superior, and Morgan group. The Florado Mining Co. operated the Florado mine and 100-ton selective-flotation mill 7 months during 1943 and shipped lead concentrates to the Leadville smelter and zinc concentrates to the Amarillo (Tex.) smelter. The Rogers Mines, Inc., operated the Morgan group of claims from August to December and, in addition to shipping to the Resurrection mill, shipped 234 tons of ore containing 4.15 ounces of gold, 511 ounces of silver, 2,909 pounds of copper, 10,599 pounds of lead, and 111,044 pounds of zinc to the Golden Cycle mill and Tooele (Utah) lead smelter. Twenty-eight tons of lead ore were shipped to the Leadville smelter from the Pennsylvania mine. Several cars of zinc-lead sulfide ore were shipped to the Midvale (Utah) custom mill from the Clara and Superior mines.

Ten Mile (Kokomo, Robinson) district.—The Wilfley Leasing Co. operated its Wilfley mine and 75-ton selective-flotation mill 1 mile west of Kokomo throughout 1943. The mill handled 9,063 tons of ore, composed largely of marmatite and pyrite, yielding 97 tons of lead concentrates and 1,476 tons of zinc concentrates which were shipped to the Leadville and Amarillo (Tex.) smelters. L. J. Gould and A. R. Rhine continued to operate the Washington and Hancock group (known as the Lucky Strike group) throughout 1943 and produced 6,367 tons of crude milling ore which were shipped to the Midvale (Utah) custom concentrator and the Golden Cycle mill at Colorado Springs. Several truckloads of dry silver ore were shipped to the Leadville smelter from the Golden Queen and Queen of the West mines. The Kimberly property was reopened by Kokomo-Kimberly Mines, Inc., on May 16 and continued to operate the remainder of the year. Ore shipped to the Golden Cycle mill at Colorado Springs totaled 611 tons and contained 84.63 ounces of gold, 1,619 ounces of silver, 1,701 pounds of copper, 7,758 pounds of lead, and 128,491 pounds of zinc. Three carloads of test ore from the Nettie B mine were also shipped to the Golden Cycle mill.

TELLER COUNTY

CRIPPLE CREEK DISTRICT

Except for several years, Cripple Creek has been annually the leading gold-producing district in Colorado, and its total output makes it rank first among gold-producing districts. From 1891, when gold was discovered in that area, through 1943 it has yielded a total of 18,465,849 fine ounces valued at $399,879,197, or 48 percent of the State total output of gold from 1858 to 1943, inclusive. In 1943 the district produced 45,105 ounces (33 percent of the State total) compared with 104,455 ounces (39 percent) in 1942 and 133,470 (35 percent) in 1941. The decreased production of gold in 1942 and 1943 reflects the effect of the Gold Mining Limitation Order of October 1942 on the mining industry of the Cripple Creek district. The total production of ore from Cripple Creek mines and dumps in 1943 was 226,908 tons, all treated in the Golden Cycle mill (operations reviewed under El Paso County). Cripple Creek ores generally contain gold as the only commercial metal, but some silver ore has been shipped from two or three veins in the district; a small quantity of silver is recovered annually in bullion and concentrates produced from the gold ores.

MINES REVIEW

Operations of the Golden Cycle Corporation, which owns and operates the Golden Cycle mill at Colorado Springs and several mines in the Cripple Creek district, are described in the following extract from its annual report to stockholders for the year ended December 31, 1943 (dated April 15, 1944):

> Stockholders have been fully informed in prior reports from the Golden Cycle Corporation of the order of the Mining Branch of the War Production Board, Washington, D. C., entitled "Limitation Order L–208" closing down all "non-essential" gold mines in the United States, its territories or possessions. The Appeals Branch of the War Production Board on December 3, 1942, granted an extension of six months to the Golden Cycle Corporation to operate under certain restrictions from December 8, 1942, to June 8, 1943; and, thereafter, a further extension was granted, effective August 8, 1943, to continue gold mining operations

in Cripple Creek, Colo., and to accept gold ore from other mines and lessees at Cripple Creek and in Boulder County, subject to certain conditions, chief of which was:

> "That the milling of base metal ores be increased as rapidly as such ores become available and every effort be made to actively engage in the mining of base metal ores for our own account, that facilities and equipment now used in gold mining and milling be transferred for use in base metal mining and milling whenever necessary and suitable, that the milling of gold ores shall in no way conflict with expansion in base metal milling capacity."

During the latter part of 1942 the management had already started to convert the facilities and operations of the corporation to the war effort wherever and however possible. Our chief activities during 1943 to aid the war effort were as follows:

Production of strategic metals.—(1) Conversion of the flotation units at the Golden Cycle mill to handle approximately 450 to 500 tons of zinc-lead ores per day was finished in the latter part of April 1943. First shipments of concentrates were made the latter part of May 1943. During the period January through December 31, 1943, a total of 58,802 tons of complex ore with a gross value of $524,935 were purchased from shippers for the production of zinc-lead concentrates. It is significant to note that the complex ore purchased during this period contained the following metals: 9,460,280 pounds of zinc; 4,470,839 pounds of lead; 280,800 pounds of copper; 182,191 ounces of silver; and 3,825 ounces of gold; gross value $524,935.

(2) During 1943, 6,325 tons of zinc concentrates were shipped to the smelters of the American Zinc Co. at Dumas, Tex., and 3,001 tons of lead concentrates shipped to the American Smelting & Refining Co. at Leadville.

(3) Since the gold ore at Cripple Creek contains no strategic metals such as zinc, lead, or copper, it has been necessary for the Golden Cycle Corporation to build up the necessary production of zinc-lead ores for treatment at our mill from all parts of the State of Colorado. Zinc-lead ore for the Golden Cycle mill at Colorado Springs is shipped from zinc-lead mines located in and near Leadville, Montezuma, Kokomo, the Bonanza district, Alma, Clear Creek County, San Juan County, and other mineralized areas of Colorado. The Golden Cycle Corporation also was engaged in the operation, during 1943, of several zinc-lead properties on its own account. We operated a lease on the Pelican-Dives property at Silver Plume, Colo.; the results were disappointing. We also operated a lease on the Monte Cristo property located near Hoosier Pass, Summit County, Colo. Work commenced late in June 1943, and after installation of power lines, machinery and equipment, building of roads, etc., shipments were started to the Golden Cycle mill from a deposit of lead-zinc ores lying on top of the ground. This ore was trucked 52 miles to Buena Vista, then loaded on railroad cars of the Denver & Rio Grande Western Railroad, and shipped via rail to the mill at Colorado Springs. For the period June 1943 to December 10, 1943 (at which time it became necessary to shut down operations due to winter weather conditions), 11,217 tons of low-grade ore were produced and shipped to the mill. While the ore was low grade it was helpful to permit the mill to maintain sufficient tonnage of zinc-lead ores until complex ores from other sources could be brought in.

(4) At present the average daily tonnage of lead-zinc ores being received at the mill approximates 500 tons per day. Additional work is now being done in the flotation unit to increase our daily capacity, and it is expected that during 1944 a large tonnage of zinc-lead ores will be treated.

Production of railroad ballast and crushed rock.—During 1943 the Midland Terminal Railway furnished the Rock Island Railroad with approximately 57,513 yards of ballast for use by the Rock Island on its main line from Colorado Springs east. This ballast, a fine decomposed granite product, was furnished from a pit located along the Midland's roadway.

The shops of the Midland Terminal Railway continued to manufacture small items used in aircraft construction.

A substantial tonnage of crushed rock was furnished from the Cripple Creek waste dumps to army installations in the vicinity of Colorado Springs.

Production of coal and power.—Work is now well along at the power plant of the Golden Cycle Corporation, located at our Pikeview coal mine, seven miles north of Colorado Springs, to greatly increase the capacity of the power plant to furnish standby service to the City of Colorado Springs, which operates a municipally-owned utility. This utility furnishes power to army and air camps located in the vicinity of Colorado Springs. We now have the capacity to provide, if necessary, a large steady load to power users.

Production of the coal mine for 1943 was above normal. This was due to the fact that we furnished army camps located within the vicinity of Colorado Springs and elsewhere in the State of Colorado with coal. Due to the defense activity within the vicinity of Colorado Springs the demand by local consumers of coal has also been increased.

Gold-mining operations. Ajax, Anchoria Leland, and Index mines.—Gold mining operations of the Golden Cycle Corporation were greatly curtailed during 1943 due not only to the effect of Limitation Order L–208, but also to the very acute manpower shortage existing in the Cripple Creek district; practically all able-bodied men in the district have gone into the armed forces or to higher-paid defense jobs. Because of the small production of mine-ore it became necessary to ship a large tonnage of dump rock to furnish sufficient ore to the Golden Cycle mill to operate. Approximately 75 percent of gold ore shipped from the Cripple Creek district during 1943 was dump rock.

Work was carried on at the Ajax mine during the year with a very small crew of men. Some good chutes of ore were opened up on the 26th, 27th, and 28th levels. 37,278 tons of dump ore, with an average value of $3.08 per ton, were shipped from the Ajax Monument dump to the Golden Cycle mill.

Very little work was done on the Anchoria Leland during the year. No underground work was done on the Index, but a small tonnage was shipped by lessees from the Index dump.

Carlton drainage tunnel.—In July 1943 a cave-in occurred in the Carlton tunnel and partially blocked it. After considerable difficulty and expense the cave-in was removed and the tunnel opened. At present we are replacing timbers to prevent such trouble in the future. The tunnel has proved a tremendous benefit in keeping water drained from the mines in the Cripple Creek district during the shutdown period created by the war. Water produced by the tunnel was sold for irrigation purposes.

At this time it is impossible to forecast with any certainty the future of our company during the war period. Every effort will be made to continue with our activities in connection with producing war necessities. Stockholders are assured that every effort will be made to conserve the properties and assets of the corporation for the stockholders' best interest, with the expectation that with the end of the war, operations can again be resumed upon a normal basis.

The annual report of the United Gold Mines Co., an operating and holding company for property scattered throughout the Cripple Creek district, for the year ended December 31, 1943 (dated February 15, 1944), gives the following details on operations at individual mines:

Herewith is annual statement of the United Gold Mines Co. for the twelve months ended December 31, 1943.

Comparative statistics follow:

	1943	1942	Decrease (−) or increase (+)
Operating gain or loss	($13, 102)	$40, 623	−$53, 725
Current assets	198, 894	218, 946	−20, 052
Current liabilities	58, 091	67, 142	−9, 051
Working capital	140, 803	151, 805	−11, 002
Gross value of company ore produced	349, 534	140, 314	+209, 220
Gross value of lessees ore produced	352, 143	867, 379	−515, 236
Total gross value company and lessees ore	701, 677	1, 007, 693	−306, 016

The stockholders are familiar with Limitation Order L–208 entered on October 8, 1942, by the Mining Branch of the War Production Board, Washington, D. C. This order closed all "non-essential" gold mines in the United States, its territories or possessions. On December 8, 1942, permission was granted to the United Gold Mines Co. to mine gold ore for a period of six months commencing December 8, 1942, expiring June 8, 1943, with certain restrictions. This permission was subsequently extended from June 8, 1943, to August 8, 1943, and thereafter again extended by the War Production Board on a limited basis.

Despite this extension, because of the fact that practically all able-bodied men in the Cripple Creek Mining district have either entered the armed forces of the United States or left the Cripple Creek district to take defense jobs, and the difficulty in securing necessary mining supplies during the year 1943, the smallest amount of work in the history of the company was done on various United Gold Mines Co. properties.

A résumé of our operations follows:

Production during the year 1943 was 129,014 tons with average value of $5.44 per ton. Of this total, 72,566 tons, of the average value of $3.35 per ton, was shipped from the Theresa dump; the balance of 56,448 tons was shipped from other United Gold Mines Co. properties.

Portland No. 1 and No. 2 shafts, the Vindicator and Rose Nicol shafts were operated by the company chiefly for the accommodation of split-check lessees. The number of lessees now working on United Gold Mines Co. properties is the lowest in many years. There are only twenty-four sets of lessees now working on the above four shafts.

Portland operation.—Production from the Portland shafts for 1943 was 6,002 tons of company ore, with average value of $10.09 per ton. Lessees' production was 3,947 tons, with average value of $14.97 per ton. The bulk of the company ore was "cave muck" mined on the old stopes in the 27th, 29th, and 30th levels of the Portland mine 1,704 feet of development work was done by the company and lessees during the year.

Vindicator operation.—The company shipped 4,938 tons of ore, with an average value of $6.12 per ton. This ore was principally screenings from the rock crushing plants. Lessees shipped 18,812 tons of ore, with an average value of $6.01 per ton. Development work totaled 2,272 feet by both company and lessees.

Rose Nicol operation.—Company ore shipped amounted to 768 tons, with an average value of $9.83 per ton. Lessees shipped 3,566 tons, with an average value of $12.15 per ton. 1,370 feet of development work was done during the year by both company and lessees.

Patti Rosa operation.—The Patti Rosa shaft located on the north side of Bull Hill is the only shaft now being operated by lessees. A fair tonnage of ore was shipped from this shaft during 1943.

Ballast pit operation.—During the summer and fall of 1943 the United Gold Mines Co. operated a ballast pit located at mile post 32 on the Midland Terminal Railway. This ballast was produced for the Rock Island Railroad which used it on the main lines from Colorado Springs to Chicago. Total ballast produced during the season was 57,686 yards. Due to the heavy traffic railroads are handling because of the war emergency, ballast is one of the most essential war items.

During 1943 the United Gold Mines Co. also produced crushed rock for army camps located in the vicinity of Colorado Springs. Production was 6,160 tons for the year.

It is hoped that during 1944 the War Production Board will modify Limitation Order L–208 to permit gold mines to resume operations. However, even in the event such modification is made, it is doubtful whether or not sufficient miners and the material necessary to mine can be secured to operate the properties of the United Gold Mines Co. on any kind of normal basis during the war period. Our company's immediate future, certainly during the war, appears at this time very uncertain and no accurate forecast can be made.

Production of company ore by United Gold Mines Co. in 1943

Mine	Net tons	Gross value [1]	Company ore cash receipts	Average gross value per ton [1]
Vindicator	4, 938	$30, 240	$13, 909	$6. 12
Rose Nicol	768	7, 544	4. 267	9. 83
Portland	6. 002	60, 572	35, 330	10. 09
Theresa-Cycle Dump	72, 566	242, 759	34, 126	3. 35
No. 2 Plant	2, 054	8, 419	2, 428	4. 10
	86, 328	349, 534	90, 060	4. 05

[1] Gross value calculated at settlement value of $33.50 per fine ounce of gold content.

Production of lessee ore of United Gold Mines Co. in 1943

Group	Net tons	Gross value [1]	Royalties received	Lessees' receipts	Average gross value per ton [1]
Vindicator	18, 813	$113, 013	$19, 459	$31, 563	$6. 01
Rose Nicol	3, 566	43, 336	13, 152	14, 144	12. 15
Portland	3, 947	59, 093	19, 183	20, 301	14. 97
Bull Hill Group	16, 361	136, 701	8, 243	56, 921	8. 36
	42, 687	352, 143	60, 037	122, 929	8. 25

[1] Gross value calculated at settlement value of $33.50 per fine ounce of gold content.

Production of properties of United Gold Mines Co. before and after organization of the company (May 15, 1902) to December 31, 1943

	Net tons	Gross value [1]
Ore mined before consolidation	26, 310	$456, 806
Production under operation of United Gold Mines Co	2, 468, 425	25, 084, 396
Total to Dec. 31, 1943	2, 494, 735	25, 541, 202

[1] Settlement value.

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the 12 months ended December 31, 1943 (dated February 1, 1944), says—

PRESIDENT'S REPORT

Stockholders have been fully informed relative to Limitation Order L–208 which was entered October 8, 1942, by the Mining Branch of the War Production Board, Washington, D. C. This order closed down all "non-essential gold mines in the United States, its territories or possessions." On December 8, 1942, permission was granted to the Cresson to mine gold ore during a period of 6 months beginning December 8, 1942, expiring June 8, 1943, provided, that no worker should be employed if the War Manpower Commission found he was needed at mining operations elsewhere.

This permission was subsequently extended from June 8, 1943, to August 8, 1943, and thereafter again extended on a limited basis. However, due to the utter impossibility of securing sufficient labor to operate our property since almost all of our miners had either entered the armed forces of the United States or left the Cripple Creek mining district to take higher paying defense jobs, coupled with the impossibility to secure necessary mining supplies, it was necessary to shut down the Cresson mine. Consequently there are no mining operations going on in the Cresson mine at present and it remains in a standby condition.

The machine shops at the Cresson mine have been busy on some war contracts and during 1943 manufactured small essential war items of a nature which could be handled with the machine shops located at the Cresson mine.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903 to December 31, 1943

Period	Dry short tons	Gross value[1]	Freight and treatment	Net value
1903 to Dec. 31, 1942	3,194,378	$46,190,822	$15,246,688	$30,944,134
1943:				
Company ore	8,155	58,403	28,494	29,909
Lessee ore	11,861	152,483	54,024	98,459
1903 to Dec. 31, 1943	3,214,394	46,401,708	15,329,206	31,072,502

Period	Royalties received by company	Amount paid lessees	Average gross value per ton	Average net value per ton	Dividends
1903 to Dec. 31, 1942			$14.46	$9.69	$13,552,473
1943:					
Company ore			7.16	3.67	12,200
Lessee ore	$47,855	$50,604	12.86	8.30	
1903 to Dec. 31, 1943			14.44	9.67	[2] 13,564,673

[1] Gross value in 1943 calculated at settlement value of $33.50 per fine ounce of gold content.

[2] Represents 29.23 percent of gross value and 43.65 percent of net value.

Shipments from the Stratton properties in 1943 totaled 6,767 tons of ore, which had a total gross settlement value of $142,957.64 or an average settlement value of $21.13 per ton. About a third of the ore produced was dump ore shipped from three groups of dumps on Bull Hill. The principal producers of mine ore were A. B. Cobb, J. E. Vanderwalker, E. L. Grimes, and John Reid.

Other producing mines and dumps in the Cripple Creek district in 1943 included the Mary McKinney, Empire Lee, Acacia, Free Coinage, Forest Queen, Economic dump, Joe Dandy, Prince Albert, and New Gold Dollar.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE EASTERN STATES

SUMMARY

Copper, lead, and zinc mines and ore-reduction mills in the Eastern States operated at a slightly higher daily average crude-ore tonnage rate in 1943 than in 1942, despite a shortage of labor that prevented some properties from attaining maximum output. Several newly developed or recently reopened mines were put in operation during the year, as the mining industry, in cooperation with Government agencies, acted to maintain production at a high level as long as required for war purposes. The total output of recoverable copper, lead, or zinc varied little from 1942, and there was no large change in output in the various States. Copper production was nearly the same as in 1942 in North Carolina but decreased in Pennsylvania and increased in Tennessee. Vermont, which produced no copper from 1931 to 1942, inclusive, contributed to the output after the old Elizabeth mine was reopened at South Strafford in September 1943. Nearly all the lead came from mines producing zinc as the metal of chief value; output decreased in New York and Tennessee and increased in Virginia. Zinc production showed little change in New York and New Jersey but decreased in Tennessee and increased in Virginia. Of the 199,233 tons of recoverable zinc produced in 1943 two mines in New Jersey contributed 47 percent, three in New York 23 percent, seven in Tennessee 20.5 percent, and two in Virginia 9 percent; six small mines and prospects in Tennessee and Virginia together contributed 0.5 percent. Some of the large mines continued to operate without receiving the Government premium for any part of their output, and less than 5 percent of the total "mine" value of the zinc concentrates (calculated for all concentrates upon the basis of the average value reported for New York, Tennessee, and Virginia concentrates) represented premiums for overquota production. Gold output in the Eastern States decreased heavily in 1943 owing to the wartime shut-down of all the important producing gold mines; the quantity of gold recovered from base-metal ores was approximately the same as in 1942. Silver production increased in 1943 owing to expanded output of silver-bearing copper and zinc-lead ores.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported, except that of zinc in New Jersey, has been calculated at the prices in the following table. The value of the New Jersey output is the total value of the zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Annual figures for the 5 years ended with 1943 are given in the table that follows. The figures for tonnage of ore sold or treated do not include magnetite ore containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts.

Mine production of gold, silver, copper, lead, and zinc in the Eastern States, 1939–43, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons) [1]	Gold (lode and placer) [2]		Silver (lode and placer) [3]	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	47	24	3,409,619	17,414	$609,490	94,083	$63,862
1940	40	18	3,674,815	18,456	645,960	102,825	73,120
1941	43	14	3,780,397	21,982	769,370	106,051	75,414
1942	36	17	[4] 4,130,226	14,699	514,465	105,307	74,885
1943	29	3	4,211,961	2,878	100,730	128,129	91,114

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
1939	21,295,000	$2,214,680	6,284	$590,696	180,955	$21,100,174	$24,578,902
1940	25,490,000	2,880,370	4,831	483,100	178,815	24,135,445	28,217,995
1941	27,132,000	3,201,576	5,513	628,482	191,310	29,484,423	34,159,265
1942	28,404,000	3,436,884	4,475	599,650	199,809	36,190,180	40,816,064
1943	28,490,000	3,703,700	4,843	726,450	199,233	39,225,222	43,847,216

[1] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

[2] Includes placer gold as follows: 1939, 413 ounces; 1940, 452 ounces; 1941, 203 ounces; 1942, 69 ounces; 1943, 12 ounces.

[3] Placer silver did not exceed 35 ounces in any year during the 4-year period ended with 1942, and none was produced in 1943.

[4] Revised figure, resulting from revision of New Jersey total ore from 643,766 to 607,766 tons.

Gold.—Iron (magnetite-pyrite-chalcopyrite) ore from the Cornwall mine in Lebanon County, Pa., yielded 77 percent of the total Eastern States gold output in 1943; the gold was contained in copper concentrates shipped to the smelting and electrolytic-refining plant at Laurel Hill, N. Y. Small quantities of gold were recovered from copper-iron ore from the Tennessee Copper Co. mines in Polk County, Tenn., and the Fontana mine in Swain County, N. C.; and from zinc-lead ore from the Valzinco mine in Spotsylvania County, Va. The only output of gold ore was 156 tons shipped from Smyrna, S. C. In Georgia 12 ounces of placer gold were produced. The estimated output of gold in the Southern Appalachian States from 1799 to 1943 is recorded as follows:

Mine production of gold in the Southern Appalachian States, 1799–1943

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830–1943	49, 489	$1, 198, 775	South Carolina	1829–1943	318, 801	$7, 562, 125
Georgia	1830–1943	870, 521	18, 084, 082	Tennessee	1831–1943	20, 500	465, 130
Maryland	(1) –1943	6, 102	163, 940	Virginia	1828–1943	167, 414	3, 572, 469
North Carolina	1799–1943	1, 164, 567	24, 327, 108				
				Total	1799–1943	2, 597, 394	55, 373, 629

[1] Year of first production not recorded.

Silver.—The silver output of the Eastern States in 1943 was recovered as a byproduct of the mining of other metals. Copper-iron and copper ores from North Carolina, Tennessee, and Vermont yielded slightly more than 48 percent of the total silver, zinc-lead ore from New York and Virginia 41 percent, and iron (magnetite-pyrite-chalcopyrite) ore from Pennsylvania 10 percent; only 135 ounces were recovered from gold ore.

Copper.—Mines contributing to the output of copper in the Eastern States in 1943 were the Bethlehem Steel Co. Cornwall mine in Lebanon County, Pa., which yields copper, cobalt, gold, and silver as byproducts of iron mining; the North Carolina Exploration Co. Fontana copper-iron mine and the North Carolina Mining Co. Hazel Creek copper-(zinc) mine in Swain County, and a prospect in Mecklenburg County, N. C.; the Tennessee Copper Co. copper-iron sulfide mines in Polk County, Tenn.; the Valzinco zinc-lead mine (yielding byproduct copper, silver, and gold) in Spotsylvania County, Va.; the Vermont Copper Co. copper mine in Orange County, Vt.; and the Terry gold mine in York County, S. C., which yields a little copper recovered from gold ore. As the three principal copper-producing mines are in different States (North Carolina, Pennsylvania, and Tennessee), it is not possible to show the production separately by States without disclosing that of individual mines; the combined output of the three States is shown under Tennessee in the following table. The total output of copper in the Eastern States varied little from 1942; final figures show an increase of 0.3 percent in 1943. A decrease in Pennsylvania was offset by an increase in Tennessee and by output after October 1 from the reopened Elizabeth copper mine in Vermont.

Lead.—The lead output in the Eastern States is derived chiefly from zinc-lead sulfide ore, of which 905,634 tons were mined in 1943 compared with 846,820 tons in 1942. The straight lead ore mined in 1943 totaled 2,666 tons of carbonate, all from the Embree mine in Tennessee. Producers of zinc-lead ore were the Balmat mine in New York, the Austinville and Valzinco mines in Virginia, and the Bunche's Hollow and George Blow mines in Tennessee. Some of the lead concentrates from Virginia were shipped to the El Paso (Tex.) smelter, and a zinc-lead concentrate derived from lead cleaner tails at one of the mills was shipped to the Tooele (Utah) smelting and slag-fuming works. The output of recoverable lead decreased 79 tons from 1942 in New York and 38 tons in Tennessee but increased 485 tons in Virginia.

Zinc.—The ability of the mining companies to maintain zinc production in the Eastern States at nearly the record high level of 1942 was an important factor in supplying adequate quantities of zinc for war uses. The proximity of the mines to smelters and manufacturing centers enhances their value as a dependable source of zinc. In 1941 and 1942 mines in the Eastern States yielded 26 percent of the United States total mine output of zinc. The producing mines in New Jersey, New York, and Virginia were the same in 1943 as in 1942, except for the small shippers of carbonate or silicate ore in Virginia. In Tennessee the American Zinc Co. began producing from two newly developed mines during the year, making five mines operated in the State by that company. Production was hampered by labor shortage, and the total output of zinc from the company mines was less than in 1942. The Universal Exploration Co., the other large Tennessee producer, maintained output at approximately the same level in both years. The reserves of zinc ore in Tennessee are reported ample for sustained production over a considerable period, but the mines cannot operate at capacity in 1944 unless the shortage of labor that prevailed in the early part of the year is relieved. Production of recoverable zinc in New Jersey and New York was nearly the same as in 1942, but that in Virginia increased 16 percent. The remarkable performance of the zinc mines in the Eastern States under war conditions is shown by figures given by James Douglas, Director, Zinc Division, War Production Board, in an address at the twenty-sixth annual meeting, American Zinc Institute, Inc., St. Louis, Mo., April 17, 1944. The figures, which cover the period from October to December 1943, inclusive, show that only 5.4 percent of the recoverable zinc produced in the Eastern States came from B and C quota mines and that the average price paid per pound of zinc from A, B, and C quota mines was 8.87 cents; in the Western States 16.3 percent of the zinc came from B and C quota mines, and the average price was 10.54 cents; and in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri) 68.2 percent came from B and C quota mines, and the average price paid was 13.08 cents.

MINE PRODUCTION BY STATES

Mine production of gold, silver, copper, lead, and zinc in the Eastern States in 1943, by States, in terms of recovered metals

State	Mines producing		Ore (short tons)	Gold			Silver		
				Fine ounces		Total value	Fine ounces		Total value
	Lode	Placer		Lode	Placer		Lode	Placer	
Georgia		3			12	$420			
New Jersey	2		602,646						
New York	3		513,945				38,004		$27,025
North Carolina	3		24,332	131		4,585	7,169		5,098

[1] Ore is magnetite-pyrite-chalcopyrite, flotation copper concentrates from which yielded gold, silver, and copper; Bureau of Mines not at liberty to publish figures for ore and copper.

[2] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

[3] Includes output from Alabama, as follows: 1 lode mine; ore treated, 35 tons; gold produced, 1 ounce; value, $35. No production from Vermont in 1942.

[4] Revised figure, resulting from revision of New Jersey total ore from 643,766 to 607,766 tons.

[5] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.

[6] North Carolina and Pennsylvania included under Tennessee; Bureau of Mines not at liberty to publish separate figures.

[7] Excludes value of copper, which is included under Tennessee.

[8] Includes also value of copper from North Carolina and Pennsylvania.

MINING INDUSTRY

Important war-stimulated expansions in copper, lead, and zinc mining in the Eastern States in 1942 and 1943 were accomplished by broadening the scope of operations at developed and equipped mines. New operations contributing worthwhile quantities of metal were the reopened Valzinco zinc-lead mine in Virginia, equipped during 1942 with a 100-ton mill and operated throughout 1943; two newly developed American Zinc Co. zinc mines in eastern Tennessee, which began shipping ore to the company Mascot mill in 1943; the reopened Elizabeth copper mine in Vermont, which was equipped with a new mill and began operating October 1, 1943; and the reopened Hazel Creek copper mine in North Carolina, which shipped crude ore to smelters during most of 1943. The Bureau of Mines examined old copper, lead, and zinc mines, prospects, and mineralized areas throughout the Eastern States and did exploratory diamond drilling at places considered favorable for developing ore reserves. Properties explored, besides those mentioned in the following Review by States, included the old Stone Hill copper property in Cleburne and Randolph Counties, Ala.; the Cape Rosier zinc property at Harborside, Me.; and the Ore Hill zinc property at Warren, N. H. The only activity in lode-gold mining in the Eastern States in 1943 was a small-scale operation near Smyrna, S. C.; a little placer gold was recovered in Lumpkin and Union Counties, Ga. The quantity of the various types of ore mined in the Eastern States is shown in the table that follows.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in the Eastern States in 1943, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (short tons)	Zinc (short tons)
Dry and siliceous gold ore	156	147	135	1,000		
Copper ore	1,060,458	451	61,948	[1] 28,289,000		(2)
Magnetite-pyrite-chalcopyrite ore	(3)	2,218	13,095	(1)		
Lead ore	2,666				155	
Zinc ore	2,243,047					145,619
Zinc-lead ore	905,634	50	52,951	200,000	4,688	[2] 53,614
Total, lode mines	[4] 4,211,961	2,866	128,129	28,490,000	4,843	199,233
Total, placers		12				
	[4] 4,211,961	2,878	128,129	28,490,000	4,843	199,233
Total, 1942	[5] 4,130,226	14,699	105,307	28,404,000	4,475	199,809

[1] Copper from magnetite-pyrite-chalcopyrite ore included with that from copper ore.

[2] Zinc from copper ore included with that from zinc-lead ore; Bureau of Mines not at liberty to publish separate figures.

[3] Bureau of Mines not at liberty to publish separate figures for ore and copper.

[4] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

[5] Revised figure, resulting from revision of New Jersey zinc ore from 643,766 to 607,766 tons.

METALLURGIC INDUSTRY

The methods of treatment used in the various mills in the Eastern States and other operating details, including tonnage and grade of concentrates produced at some of the mills, are given in the Review by States that follows. Most of the concentrates are shipped to smelters operated by the companies that own the mines. The small quantity of gold ore mined in 1943 was shipped crude to a smelter, and no amalgamation or cyanidation mills were operated. Twelve ounces of placer gold were recovered by hand methods. Direct-smelting ore (165,868 tons) yielded 505 ounces of recoverable gold and 46,347 ounces of silver in 1943, and concentrates smelted (82,017 tons) yielded 2,361 ounces of gold and 81,782 ounces of silver; the figures for ore and concentrates do not include material containing no recoverable gold or silver. The totals for direct-smelting ore and concentrates were 166,175 and 742,499 tons, respectively.

REVIEW BY STATES

GEORGIA

Mines in Georgia produced no silver, copper, lead, or zinc in 1943. Two ounces of gold were recovered by individuals placer mining in Lumpkin County, and 10 ounces were found in a creek bed in Union County while rock was being taken out to crush for road work.

NEW JERSEY

Crude zinc ore mined in New Jersey in 1943 totaled 602,646 tons yielding 92,864 tons of recoverable zinc as metal or in oxide compared with 607,766 (revised figure) and 94,040 tons, respectively, in 1942. The producing mines in both years were the mine Hill at Franklin and the Sterling Hill at Ogdensburg, Sussex County. The commercial ore minerals comprise chiefly franklinite and willemite but also include zincite. Each mine is equipped with a mill. In the reduction of the ore the franklinite (a zinc-iron-manganese mineral) is removed from the crushed ore by magnetic separators, and the willemite and zincite are concentrated on jigs and tables. The concentrates are shipped to smelting and manufacturing works at Palmerton, Pa. The franklinite is used in the manufacture of zinc oxide and spiegeleisen, and the willemite-zincite concentrate is smelted to produce high-grade slab zinc.

The value of the New Jersey output of zinc given in the table of this chapter under the heading Mine Production by States is the combined value of the zinc recoverable in both metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

New Jersey has a few deposits of copper ore, but none has been worked for many years. Copper and lead smelters and refineries at Carteret and Perth Amboy treat ores, scrap, byproducts, and bullion from various States and foreign countries.

NEW YORK

The silver, lead, and zinc produced in New York come from a small area in St. Lawrence County east and southeast of Gouverneur. The yearly production from 1928 to 1942, inclusive, is given in the preceding report of this series (Minerals Yearbook, 1942, p. 356); previous records year by year are found in Mineral Resources of the United States, the annual publication that antedates Minerals Yearbook. Most of the output in 1943, as in other recent years, was produced by the Balmat and Edwards mines of the St. Joseph Lead Co. In response to the need for expanding domestic mine output of zinc for war purposes, the company increased output materially in 1941 and again in 1942, and the 1942 rate was maintained in 1943. The Balmat ore contains zinc, iron, and lead sulfides, and some silver is associated with the lead; it is mined through a 2,655-foot inclined shaft (vertical depth, about 1,300 feet) and treated in the 1,200-ton selective flotation plant at the mine. The mill feed in 1943 totaled 359,944 tons; it yielded 3,941 tons of lead concentrates containing 60.99 percent lead and 10.72 ounces of silver to the ton, 64,659 tons of zinc concentrates containing 55.96 percent zinc, and 70,456 tons of pyrite concentrates containing 40.92 percent iron and about 49 percent sulfur. The Edwards mine was operated through a vertical shaft 1,560 feet deep and an underground shaft (inclined 42° from horizontal) 1,226 feet to the mine workings. Ore treated totaled 133,965 tons yielding 23,695 tons of zinc concentrates containing 59.28 percent zinc. The zinc concentrates from both mills were shipped to the company smelter at Josephtown, Pa.; the lead concentrates from the Balmat mill were shipped to the company Herculaneum (Mo.) smelter. The pyrite concentrates were sold to sulfuric acid plants. During January the Universal Exploration Co. continued development work at its Hyatt zinc mine near Emeryville; production was suspended in August 1942. Mining and milling were resumed in February 1943 and continued throughout the year; the concentrates were shipped to the Donora (Pa.) smelter. At the Parker-Webb properties near Gouverneur, controlled by the Northern New York Mining Corporation, the Bureau of Mines completed a diamond-drilling project, and the corporation sank about 80 feet of shaft.

There are no zinc or lead smelters in New York. The Phelps Dodge Refining Corporation has a custom copper smelter and an electrolytic refinery at Laurel Hill which treat copper ore, matte, bullion, and copper-bearing scrap material.

NORTH CAROLINA

Since the closing of the Condor (old Howie) mine near Waxhaw in Union County and several smaller gold mines in other parts of North Carolina in the latter part of 1942, the only gold output in the State has been a small quantity recovered from copper ore; the output from this source was 131 ounces in 1943 compared with 4,077 ounces from all sources in 1942. As gold ores yielded a large part of the silver produced in the State in 1942, the output of this metal also decreased in 1943, totaling 7,169 ounces compared with 8,259 ounces in 1942. The Fontana copper mine in Swain County, which has been producing steadily since 1926 and has been operated by the North Carolina Exploration Co. since February 1, 1931, continued to operate throughout 1943 but was closed early in 1944. The mine is opened by a 2,670-foot inclined shaft. The ore is copper-iron sulfide and is shipped crude to Tennessee Copper Co. plants at Copper Hill, Tenn. Less copper was produced in 1943 than in 1942. It is expected that the mine will be flooded some time in 1944 by backwater from the Fontana Dam on the Little Tennessee River. The North Carolina Mining Co. shipped crude ore from the Hazel Creek (old Adams) mine near Proctor in Swain County to the U. S. Metals Refining Co. smelter at Carteret, N. J., from April through December 1943. Although considerable prospecting and development had been done on this property before 1943, little ore was produced. The company obtained a Reconstruction Finance Corporation loan and did exploratory work to determine whether ore reserves warranted construction of a mill. The ore shipped in 1943 averaged about 10 percent copper, 5 percent zinc, and 0.25 percent lead and 0.01 ounce of gold and 1.3 ounces of silver to the ton. A 25-ton flotation mill was being constructed in January 1944. Terry & Knowlton shipped a car of 3-percent copper ore containing some gold and silver from its property near Charlotte, Mecklenburg County. The Haywood Mining Corporation did prospecting under a Reconstruction Finance Corporation loan at its lead property near Canton, Haywood County, and the Bureau of Mines did exploratory diamond drilling at the Union Copper mine in Cabarrus and Rowan Counties.

PENNSYLVANIA

The Cornwall mine in Lebanon County, operated by the Bethlehem Steel Co., is a long-time producer of magnetite ore and since 1908 has yielded important quantities of copper, gold, and silver as byproducts; during the past few years cobalt has also become an important byproduct. The mine is developed by an open pit and three inclined shafts 1,700 feet deep. The principal ore minerals are magnetite, pyrite, and chalcopyrite. The ore is crushed to about 1-inch size at the shafts in Cornwall and shipped in standard hopper-bottom railroad cars to the combined magnetic concentration and flotation mill at Lebanon. The magnetic concentration equipment has a daily capacity of 6,500 tons and the flotation equipment 2,800 tons. In addition, a 2,400-ton sintering plant handles magnetic concentrates. The flotation equipment treats tailings from the magnetic separators for the recovery of copper concentrates which contain most of the gold and silver, and pyrite concentrates which contain cobalt. The copper concentrates are shipped to the Phelps Dodge smelter and electrolytic refinery at Laurel Hill, N. Y., and the pyrite concentrates to chemical plants.

Although no zinc has been produced in Pennsylvania in recent years, according to Arthur Winslow [1] extensive zinc mining was done in the Friedensville district, Lehigh County, from 1853 to 1876. From September 1943 to January 1944 the Bureau of Mines did exploratory diamond drilling on the Correll property in this district.

Pennsylvania zinc smelters at Donora, Langeloth, Josephtown, and Palmerton treat the largest part of the zinc concentrates produced in the Eastern States, as well as large tonnages from the Central States and foreign countries. There is a roasting plant for concentrates at New Castle and an electrogalvanizing plant for sheets at Johnstown that uses roasted zinc concentrates.

SOUTH CAROLINA

The wartime shut-down of the old Haile mine in Lancaster County, principal producer of gold in South Carolina and the Eastern States from 1937 to 1942, inclusive, continued throughout 1943. E. R. Vreeland shipped 156 tons of gold ore containing some silver and copper from the Terry mine near Smyrna, York County, to the U. S. Metals Refining Co. smelter at Carteret, N. J.

TENNESSEE

The 7-year period of steady annual increases in zinc production in Tennessee which began in 1936 ended in 1943 with a 5-percent decrease from 1942. Shortage of labor resulting chiefly from migration of miners to higher paid jobs in newly created war industries prevented capacity operation of several large mines in 1943. Lead output in the State also decreased, but the quantity produced in both 1942 and 1943 was small. All the State output of copper, gold, and silver and some of the zinc came from mines of the Tennessee Copper Co., which has operated continuously in the Ducktown district, Polk County, since 1899. In 1943 the company operated the Burra Burra, Eureka, Boyd, and Calloway mines, the London and Isabella selective flotation mills, the Copperhill smelter, sulfuric acid plants, and a copper sulfate plant. The mines are opened by vertical shafts, one of which is 2,400 feet deep. Development done in 1943 totaled 1,052 feet of air shaft, 21,763 feet of drifts, and 16,601 feet of diamond drilling. The ore contains sulfides of iron, copper, and zinc, carrying a little gold and silver. The iron concentrates produced in the mills were roasted to eliminate the sulfur for use in making sulfuric acid, and the resulting calcines were sintered and sold to iron and steel producers, mostly in the Birmingham (Ala.) district. The zinc concentrates were sold to the Donora (Pa.) smelter. The copper concentrates were treated in the reverberatory furnace at the Copperhill plant without preliminary roasting. Copper-iron sulfide ore from the Fontana mine in Swain County, N. C., was also treated. A considerable quantity of crude ore was shipped direct from the company mines to the smelter for treatment in the blast furnace, and a small tonnage went direct to the reverberatory. Most of the blister copper from the converter was cast into pigs and shipped to an electrolytic refinery on the Atlantic seaboard, where some gold and silver were recovered as byproducts. Shot copper was produced for use in the copper sulfate plant.

---

[1] Winslow, Arthur, Lead and Zinc Deposits: Missouri Geol. Survey, vol. 6, 1894, p. 121.

Mines in Knox and Jefferson Counties continued to yield most of the State output of zinc. In 1943 the American Zinc Co. of Tennessee operated the Mascot No. 2, Grasselli, and Jarnagin mines throughout the year, the newly developed Athletic (Mossy Creek) mine (called Carson Newman (Athletic Field) in the report of this series for 1942) at Jefferson City from June, and the Shallow Ore open-pit mine at New Market from October to the end of the year. The ore from all five mines was concentrated in the company mill at the Mascot No. 2 mine, which has a capacity of about 4,000 tons daily and is equipped with a differential-density cone unit, jigs, and flotation machines. Ore milled totaled 1,209,992 tons, from which 52,292 tons of concentrates averaging 61.06 percent zinc were produced. In 1942 the mill produced 55,831 tons of concentrates. All the mines are fully mechanized, and slushing is the principal method of underground loading. The annual company report to stockholders contains the following data on mine development and ore reserves: Prospecting for ore extensions and development at the four underground mines totaled 32,466 feet of surface churn drilling, 48,894 feet of surface diamond drilling, 13,516 feet of underground diamond drilling, and 5,524 feet of drifts and raises. Prospecting on optioned properties in Knox County consisted of 8,011 feet of surface diamond drilling, in Jefferson County 7,262 feet of surface churn drilling and 2,340 feet of surface diamond drilling, and in Monroe County 889 feet of surface diamond drilling; this drilling did not result in finding commercial ore. The company proved and indicated ore reserves in Tennessee at the end of 1943 were approximately 42 percent greater than on January 1, 1940. The marginal ore reserves on the new Shallow Ore mine are not included in the normal ore reserves.

The Universal Exploration Co. operated its Davis mine group and 800-ton flotation mill at Jefferson City steadily; the output of zinc sulfide concentrates was approximately the same as in 1942. The concentrates were shipped to the Donora (Pa.) smelter. The small gravity-concentration mill on the property, used occasionally for treating carbonate ores, was not run in 1943. The Lacy-Butler Co. shipped 272 tons of 40-percent zinc silicate from the Finchem mine. The Embree Iron Co. operated its zinc and lead carbonate mines in Washington and Unicoi Counties near Embreeville on a small scale from January to August. During the summer of 1943 the company sold its entire holdings in the Embreeville area—including zinc, lead, and manganese mines, mining equipment, and mills—to the Tennessee Zinc Co., which devoted most of its efforts the rest of the year to reworking manganese tailings and remodeling a mill. The Bureau of Mines did exploratory diamond drilling on the property late in 1943, followed by churn drilling by the company. The company plans to do strip mining in 1944. The Embree Iron Co. continued as agent for the Metals Reserve Co., stimulating production of manganese ore in the Appalachian region and purchasing ore for the stock pile at Elizabethton, Tenn. In Claiborne County the Imperial Mining Co. operated the Bunche's Hollow mine 2 miles northwest of Goin during part of 1943 and installed flotation equipment in the mill; shipments in the latter part of the year included both lead and zinc concentrates. George Blow continued to ship zinc-lead ore from his mine in Union County to the flotation mill at the Austinville (Va.) mine. Dr. Gant Gaither shipped 58-percent zinc concentrates from his small jig mill at the Hoover mine 10 miles northeast of Murfreesboro. The Bureau of Mines did diamond drilling on the Eve's Mill zinc property in Monroe County; the results obtained warranted further investigation, and geologists of the American Zinc Co., which had previously drilled on the property, and the Federal Geological Survey began preparing a detailed map, showing the structural relations of the ore deposits in the area, to be used in making plans for additional development.

VERMONT

In 1943 the Vermont Copper Co. completed work begun in 1942 on reequipping the old Elizabeth mine in Orange County, including construction of a 500-ton flotation mill, and was in production from October 1 through December. The mine was reopened under a contract with the Metals Reserve Co., to which all the copper produced for 2½ years is to be delivered. The last previous operation was by the National Copper Corporation, which closed the mine in June 1930 owing to the low price of copper. The ore minerals are chalcopyrite and pyrrhotite, carrying some silver and a little gold. The mine is developed by a 1,200-foot adit, an underground 30° inclined shaft 750 feet long, and four main levels opening up the vein, which has a strike length of 1,000 feet. The broken ore is hauled by underground tram to loading chutes on the adit at the top of the underground shaft and from there to the mill by an electric locomotive in Granby-type ore cars of 5-ton capacity. In 1943 the mill heads averaged 2.17 percent copper. The concentrates produced (1,584 tons) contained 19.05 percent copper and 1.7 ounces of silver and 0.01 ounce of gold to the ton; they were shipped to the Phelps Dodge smelter at Laurel Hill, N. Y.

VIRGINIA

The annual production of gold, silver, copper, lead, and zinc in Virginia from 1928 to 1942, inclusive, is given in the preceding report of this series (Minerals Yearbook, 1942, p. 361); previous records year by year are found in Mineral Resources of the United States. No gold mines were operated in the State in 1943, but some gold, as well as silver and copper, was recovered from zinc-lead ore. The output of zinc and lead from the Austinville mine in Wythe County—a large steady producer since 1927—exceeded that in 1942. The ore was treated in the 2,000-ton selective flotation mill at the mine. The mill also handled small tonnages of purchased crude ore monthly. The Valzinco mine near Paytes in Spotsylvania County, reopened by Panaminas, Inc., in 1942 and equipped with a 100-ton selective flotation mill, was operated steadily throughout 1943. The mine is opened by a 250-foot shaft and a 120-foot winze. Development done in 1943 comprised 766 feet of drifts, a 176-foot raise, and 4,213 feet of diamond drilling. The mill products are zinc concentrates, lead concentrates, and zinc-lead concentrates (from lead cleaner tails), all containing a little silver, copper, and gold. The zinc concentrates were shipped to the Langeloth (Pa.) smelter, the lead concentrates to the El Paso (Tex.) smelter, and the zinc-lead concentrates to the International (Utah) lead smelter and slag-fuming plant. The Bureau of Mines did exploratory diamond drilling on the Panaminas properties from July to the end of the year; other Virginia properties drilled by the Bureau were the Toncrae-Howard (in Floyd County) and the Virgilina (Durgy) (in Halifax County) copper properties.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN IDAHO

(MINE REPORT)

By G. E. WOODWARD AND PAUL LUFF

SUMMARY OUTLINE

Mine production by counties	359
Mining industry	360
Ore classification	361
Metallurgic industry	361
Review by counties and districts	366
Coeur d'Alene region	372

SUMMARY

The total value of gold, silver, copper, lead, and zinc produced by Idaho mines was $43,199,910 in 1943 compared with $46,063,326 in 1942—a 6-percent decrease (see fig. 1). The value of the gold output was $1,078,280 (3 percent of the State total), silver $8,320,128 (19 percent), copper $604,240 (1 percent), lead $14,468,550 (34 percent), and zinc $18,728,712 (43 percent). The quantity of each metal produced was less than in 1942; however, the value of the zinc output was greater, owing to the higher average price of the metal. Compared with 1942 gold production decreased nearly 68 percent, silver 20, copper 32, lead 15, and zinc nearly 1 percent. In 1943 Idaho was the largest producer of silver, antimony, and tungsten in the United States and the largest producer of lead and zinc in the Western States.

Production of copper, lead, and zinc in Idaho in 1943 was affected by the following factors: An acute shortage of labor, which persisted throughout the year; the discovery in June of high-grade lead-silver ore in the Chester vein of the Sunshine property near Kellogg; completion in April of the Bunker Hill & Sullivan zinc slag-fuming plant at Bradley and the Hecla 2,000-ton zinc-lead tailing plant at Osburn; and the marked decrease in output of zinc-lead-silver ore from the Hecla mine at Burke.

Premium payments for overquota production of copper, lead, and zinc were in force throughout 1943; however, the War Production Board announced October 27 that premium payments in the B range had been denied to lead mines not already operating and to lead mines having a low labor productivity and located in areas in which there is a serious labor shortage; that premium payments in the B and C ranges had been denied to zinc mines not already operating and to zinc mines having a low labor productivity and located in areas in which there is a serious labor shortage; and that the Government is not now financing new zinc projects. It announced November 9 that no applications would be considered after December 31, 1943, for special copper premium prices. The Board stated that these curtailments for lead and zinc premium payments were necessary owing to increased mineral production, revised military requirements, and a greater need for manpower in the larger producing mines; that curtailments in copper premium prices were due to the balancing of copper supplies with military needs and essential civilian requirements.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1939–43, and total, 1863–1943, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	362	465	2,108,445	116,662	$4,083,170	17,222,370	$11,690,336

1943	249	69	6	------	------	------	------	------	------	------	255	69

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline floating dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

Gold.—The output of recoverable gold in Idaho was nearly 68 percent less in 1943 than in 1942. This decrease, which resulted from the closing in 1942 of most of the large lode producers and all the large placer producers, was caused principally by the gold-mine closing order issued by the Government in October 1942. The yield of gold from lode mines decreased from 50,440 ounces in 1942 to 30,553 ounces in 1943 and that from placers from 44,580 to 255 ounces. The output of gold from placers was the smallest ever recorded in the history of the State. About 53 percent of the State total gold in 1943 came from siliceous gold ore, more than 26 percent from zinc-lead ore, and nearly all the remainder from siliceous gold-silver ore. In 1942 dredging operations (chiefly bucket-line dredges) recovered 43,300 ounces (nearly 46 percent) of Idaho's gold output; no dredges operated in 1943. As a result of the idleness of dredges, gold production decreased sharply in 1943 in the Boise Basin, Yankee Fork, Middle Boise, Elk City, Hoodoo, Gibbonsville, Warren, and Orogrande districts. Gold output from lode mines slumped in the Middle Boise, Carson, West View, Mineral Hill (Lemhi County), Burgdorf-Marshall Lake, Ten Mile, Boise Basin, Thunder Mountain, and Yankee Fork districts. In 1943 nearly half of the State gold output came from a lode mine in the Middle Boise (Atlanta) district.

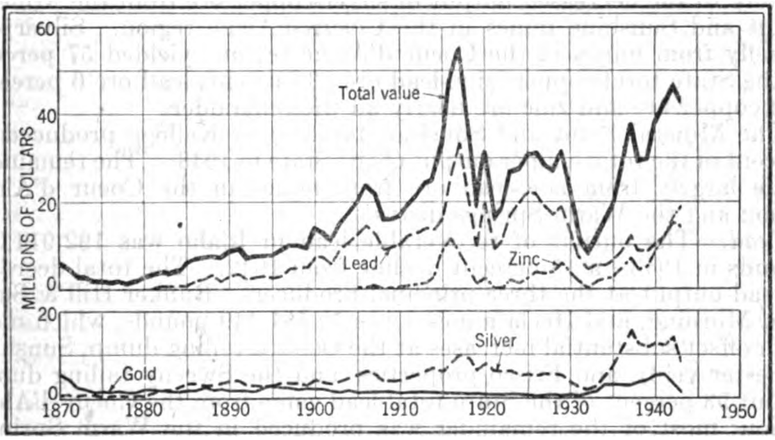

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1943. The value of copper has been less than $2,000,000 annually, except in a few years.

Talache Mines, Inc., operating a lode property at Atlanta, was by far the largest gold producer in Idaho, although the output was 40 percent less in 1943 than in 1942; it was followed by the Triumph mine near Ketchum and the Yellow Pine mine at Stibnite. These three properties produced 81 percent of the State gold output in 1943.

Silver.—The output of recoverable silver in Idaho was 11,700,180 fine ounces in 1943—20 percent less than in 1942. A greater decrease was prevented by the discovery in June of high-grade lead-silver ore in the Chester vein of the Sunshine property near Kellogg. However, the total production of silver from this mine—leading silver producer in the United States—declined more than 1,000,000 ounces. Large decreases in silver output occurred also at the Mineral Point, Hecla, Polaris, De Lamar, Bunker Hill & Sullivan, Morning, Sherman, and

Crescent properties. The Coeur d'Alene region produced 88 percent of the State total silver in 1943; the remainder came largely from the Warm Springs, Bayhorse, Yellow Pine, Deadwood Basin, Blue Wing, Middle Boise, and South Mountain districts. Of the State total silver, zinc-lead ore yielded nearly 43 percent, silver ore 39 percent, lead ore nearly 16 percent, gold-silver ore and gold ore 2 percent, and other ores less than 1 percent. The yield of silver from silver ore decreased 2,932,814 ounces and from zinc-lead ore 357,302 ounces, but that from lead ore increased 716,016 ounces owing to the yield from the Chester vein.

Eight mines—the Sunshine, Bunker Hill & Sullivan, Mineral Point, Triumph, Hecla, Page, Morning, and Polaris—produced 79 percent of the silver output of the State during 1943. All these mines except the Triumph are in the Coeur d'Alene region.

Copper.—The output of recoverable copper in Idaho in 1943 was 4,648,000 pounds—32 percent less than in 1942. The loss was due mainly to the decreased output of silver-copper ore from the Mineral Point and Sunshine mines in the Coeur d'Alene region. Silver ore (chiefly from mines in the Coeur d'Alene region) yielded 57 percent of the State total copper, zinc-lead ore 33 percent, lead ore 6 percent, and copper ore and zinc ore nearly all the remainder.

The Mineral Point and Sunshine mines near Kellogg produced 57 percent of the total copper output of the State in 1943. The remainder came largely from zinc-lead ore from mines in the Coeur d'Alene region and the Warm Springs district.

Lead.—The output of recoverable lead in Idaho was 192,914,000 pounds in 1943—a 15-percent decline from 1942. The total decrease in lead output at the three principal producers—Bunker Hill & Sullivan, Morning, and Hecla mines—was 39,581,449 pounds, which more than offset substantial increases at the Osburn tailing dump, Sunshine (Chester vein), and Frisco properties, and the Sweeny tailing dump. About 93 percent of the State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Warm Springs, Bayhorse, Port Hill, Deadwood Basin, and Pend d'Oreille districts. Zinc-lead ore and old tailings from the Coeur d'Alene region yielded 81 percent of the State total lead; and lead ore, chiefly from the Coeur d'Alene region, yielded nearly 13 percent. Lead recovered from zinc-lead ore and old tailings decreased 27,391,752 pounds and from lead ore 7,598,222 pounds.

In 1943 the combined lead output of the three largest producers—the Bunker Hill & Sullivan, Morning, and Hecla—was 91,637,688 pounds (131,219,137 pounds in 1942), or more than 47 percent of the State total; other important producers were the Page, Star, Tamarack, Sherman, Triumph, Sunshine (Chester vein), Frisco, Dayrock, Osburn tailing dump, Clayton, and Gold Hunter properties.

Zinc.—The output of recoverable zinc in Idaho was 173,414,000 pounds in 1943—a decrease of nearly 1 percent from the record output of 1942. Marked declines in output of zinc from the Hecla, Morning, Triumph, and Star properties more than offset substantial increases from the Bunker Hill & Sullivan zinc slag-fuming plant, the Osburn tailing dump, and the Frisco, Tamarack, Page, Small Lease (old tailings), Monitor, Douglas, and Hall-Interstate properties. Nearly 92 percent of the State total zinc in 1943 came from the Coeur d'Alene region and nearly all the remainder from the Warm Springs, Deadwood Basin, South Mountain, Bayhorse, and Lava Creek districts. Zinc-lead ore and old tailings concentrated yielded 94 percent of the State total zinc, and zinc slag fumed yielded most of the remainder.

Nine properties—the Star, Morning, Bunker Hill & Sullivan (mine), Tamarack, Bunker Hill & Sullivan zinc slag-fuming plant, Page, Triumph, Hecla, and Frisco—produced 84 percent of the State total zinc in 1943.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline floating dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

[2] Recovered from 75,362 cubic yards of gravel treated by 5 dry-land dredges.

[3] Recovered from 1,100,575 cubic yards of gravel treated by 7 dragline floating dredges.

[4] Recovered from 7,772,947 cubic yards of gravel treated by 10 floating bucket dredges.

MINING INDUSTRY

A labor shortage, which characterized the entire year, and the gold-mine closing order issued by the Government in October 1942 affected the mining industry in Idaho in 1943 more than any other factors. The shortage of labor became so acute during the summer months that zinc and lead production dropped; in consequence, the Army was called upon again to furlough soldiers to the critical metal-producing districts, especially to the zinc-lead mines in the Coeur d'Alene region. The output of zinc-lead ore and old tailings (by far the chief output of the State) increased 8 percent, and the output of gold-silver ore (178,749 tons) was slightly more than in 1942; but gold ore decreased 54 percent, silver ore 37 percent, and lead ore 24 percent.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Idaho in 1943, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	25	65,352	16,313	58,476	28,972	213,215	201,000
Dry and siliceous gold-silver ore	3	178,749	5,486	173,836	---------	---------	---------
Dry and siliceous silver ore	15	287,344	175	4,596,079	2,650,329	842,358	2,210
	43	531,445	21,974	4,828,391	2,679,301	1,055,573	203,210
Copper ore	8	329	24	8,515	67,025	2,247	---------
Lead ore	39	237,122	333	1,819,699	295,680	24,380,492	901,548
Lead-copper ore	1	68	1	8,172	5,015	21,500	---------
Zinc ore	4	[2] 44,382	58	46,806	64,650	737,300	8,634,182
Zinc-lead ore	49	1,928,401	8,163	4,988,528	1,536,329	166,716,888	163,675,060
Total, lode mines	[1] 127	2,741,747	30,553	11,700,111	4,648,000	192,914,000	173,414,000
Total, placers	30	---------	255	69	---------	---------	---------
	157	2,741,747	30,808	11,700,180	4,648,000	192,914,000	173,414,000
Total, 1942	439	2,900,704	95,020	14,644,890	6,860,000	227,818,000	174,512,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

[2] Includes 39,465 tons of zinc slag.

METALLURGIC INDUSTRY

Of the 2,741,747 tons of ore produced in 1943 in Idaho, 2,669,059 tons (97 percent) were treated at concentration plants, 55,020 tons (2 percent) were treated at amalgamation mills, and 17,668 tons (1 percent) were shipped crude to smelters.

Concentration plants in 1943 treated 6,350 tons of gold ore, 178,747 tons of gold-silver ore, 276,865 tons of silver ore, 234,489 tons of lead ore, 4,801 tons of zinc ore, and 1,928,342 tons of zinc-lead ore. Although 55,976 tons of current hot slag and 23,482 tons of old dump slag were fumed in 1943, only the dump slag and 15,983 tons of the hot slag were credited directly to the fuming-plant operation; the remainder of the hot slag (39,993 tons) was credited to various producers of the ores and concentrates that contributed during the year to the slag-making material.

Ore treated at straight amalgamation mills in 1943 totaled 346 tons, and that at combined amalgamation and concentration plants, 54,674 tons; none was treated at cyanidation plants.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery at near capacity in 1943 on ore and concentrates, chiefly from mines and mills in the Coeur d'Alene region. The company also operated its antimony and bismuth plant, 1,700-ton flotation mill (including sink-and-float unit), 300-ton tailing-treatment plant for recovery of iron and lead from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley. The slag-fuming plant yielded 12,401 dry tons of deleaded zinc fume and 3,032 dry tons of lead fume. The Sunshine Mining Co. operated its electrolytic antimony plant (100-ton capacity) throughout the year on silver-copper-antimony concentrates from the Sunshine and Coeur d'Alene Mines milling plants. The Sullivan Mining Co. operated continuously at capacity its 100-ton electrolytic zinc plant near Bradley on zinc and zinc-lead concentrates and oxide zinc fume produced mainly from plants in the Coeur d'Alene region. Antimony, tungsten, and antimony-iron-gold concentrates were produced throughout the year in the 600-ton flotation mill of the Bradley Mining Co. at Stibnite, and tungsten concentrates and silver-copper-lead-iron concentrates in the Ima mill at Patterson.

Mine production of metals in Idaho in 1943, by methods of recovery, in terms of recovered metals

---

[1] Production represents clean-up at idle property.

Comment on districts with small production has been omitted owing to lack of space.

ADAMS COUNTY

A total of 88 tons of copper ore was produced in 1943 from two properties near Cuprum in the Seven Devils district; 52 tons came from the South Peacock mine and 36 tons from the Helena claim.

BLAINE COUNTY

Lava Creek district.—Hoyt Ray operated the Paymaster mine, 32 miles southwest of Arco, a few months in 1943 and shipped 1,069 tons of zinc-lead ore to custom concentration mills in Utah.

Little Wood River (Muldoon) district.—One car (30 tons) of silver-lead ore from the Eagle Bird mine in Garfield Canyon was shipped direct to a smelter in 1943, and 24 tons of zinc-lead ore from the Idaho Muldoon mine were treated in a custom concentration mill in Utah.

Mineral Hill and Camas district.—As in 1942, the principal output in the Mineral Hill and Camas district in 1943 was siliceous gold ore from the Camas mine, 10 miles west of Hailey. The Camas Trust Co. operated the mine throughout the year and shipped 3,200 tons of gold ore direct to a smelter. The remainder of the district output was largely silver-lead old tailings (758 tons) from the Minnie Moore property, gold ore (140 tons) from the Treasure Vault mine, and rich lead-silver ore (32 tons) from the Lark claim.

Warm Springs district.—Except for mines in the Coeur d'Alene region, the output of zinc-lead-silver ore from the Triumph-North Star-Independence groups near Ketchum continued to be the greatest from any property in Idaho, although it was less than in 1942. The Triumph Mining Co. operated the groups throughout the year and treated 33,505 tons of low-grade marginal zinc-lead-silver ore in its 300-ton concentration mill, yielding lead concentrates and zinc-lead middlings. The middlings (9,431 tons) and 74,889 tons of higher-grade zinc-lead-silver ore were shipped to custom flotation mills at Bauer and Tooele, Utah. The rest of the district output was mainly 778 tons of old tailings (silver-lead) from the Independence dump, 271 tons of zinc-lead ore from the Blue Kitten and Homestake properties, 161 tons of zinc ore from the Lucky Boy and Horseshoe properties, and 112 tons of gold ore from the June Day mine.

BOISE COUNTY

Boise Basin district (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—During the past decade placer gold (recovered principally by bucket dredges) has been the main source of metal production in the Boise Basin district. The output of gold from placers dropped from 13,112 ounces in 1942 to 35 ounces in 1943, as all types of dredging ceased in October 1942 owing to the gold-mine closing order of the War Production Board. Nearly all the district output in 1943 was gold ore (276 tons) from the Hay Fork, Julian, and Summit properties treated by amalgamation, and zinc-lead ore (57 tons) averaging 2.81 ounces of gold and 95.39 ounces of silver to the ton, 0.48 percent copper, 8.02 percent lead, and 6.65 percent zinc, from the Come-Back mine at Pioneerville shipped direct to a smelter.

Summit Flat district.—The Golden Cycle and Viking properties north of Idaho City were operated in 1943, and a total of 54 tons of gold ore was treated by amalgamation.

BONNER COUNTY

Lakeview district.—The output of the Lakeview district in 1943 was 300 tons of silver ore, containing appreciable quantities of lead and zinc, from the Hewer (Idaho Lakeview) mine and 200 tons of zinc-lead ore from an old waste dump at the Keep Cool property, all treated by flotation.

Pend d'Oreille district.—Silver-lead ore from the Hope (Elsie K.) mine near Clark Fork continued to be the principal output in the Pend d'Oreille district. Hope Silver-Lead Mines, Inc., operated the mine and its 150-ton flotation mill throughout 1943 and treated 11,094 tons of ore containing 15,000 ounces of silver, 600,000 pounds of lead, and 245,000 pounds of zinc. Silver-lead concentrates (402 tons) and crude silver-lead ore (26 tons) were shipped to the smelter at East Helena, Mont.; no zinc concentrates were produced.

BOUNDARY COUNTY

Moyie Yahk district.—During the first 6 months of 1943 Silver Crescent, Inc., built a 50-ton flotation plant at its Regal property 14 miles northeast of Bonners Ferry. The plant operated continuously from July 1 to December 31 and treated 6,300 tons of ore containing 690 ounces of gold, 9,400 ounces of silver, 10,080 pounds of copper, 300,000 pounds of lead, and 300,000 pounds of zinc; lead concentrates and zinc concentrates were shipped to smelters at Bradley, Idaho.

Port Hill district.—Trueman Higginbotham after operating the Idaho-Continental mine under lease throughout 1942 turned his lease over to A. B. Cobb January 1, 1943. Cobb operated the mine and 90-ton flotation mill continuously until September 30, 1943, and treated 10,560 tons of silver-lead ore.

BUTTE COUNTY

Dome district.—A lessee operated the Great Western mine near Howe in 1943 and shipped 151 tons of lead ore to a smelter in Utah.

Lava Creek district.—The Horn Silver mine on Champagne Creek 20 miles southwest of Arco was operated continuously the last 6 months of 1943 by the Era Mining & Development Co.; a total of 4,117 tons of ore, averaging 0.02 ounce of gold and 5.84 ounces of silver to the ton, 0.07 percent copper, 4.89 percent lead, and 5.93 percent zinc, was shipped to custom concentration mills at Bauer and Midvale, Utah.

CAMAS COUNTY

Beaver Creek district.—Various lessees worked at the Princess-Blue Ribbon mine near Fairfield in 1943 and shipped 479 tons of siliceous gold ore to the smelter at Garfield, Utah. In addition to the gold, silver, copper, and lead content, the ore averaged more than 80 percent in silica and was greatly desired by the smelting company for use as a flux.

Little Smoky and Carrietown district.—Virtually all the output of the Little Smoky and Carrietown district in 1943 was silver ore (43 tons) shipped from the waste dump of the Stormy Galore property near Fairfield.

Skeleton Creek district.—A small lot (5 tons) of high-grade gold ore was produced in 1943 from the Red Horse mine near Fairfield.

CLARK COUNTY

The only output in Clark County in 1943 was 54 tons of lead ore produced from the Scott mine on Birch Creek. A $10,000 loan granted by the Reconstruction Finance Corporation to the Birch Creek Mining Co., Ltd., enabled the company to develop the mine throughout the year.

CUSTER COUNTY

Alder Creek district.—The Champion mine 5 miles south of Mackay was operated during the last 6 months of 1943, and 322 tons of lead ore were shipped to a smelter. The rest of the district output was mainly zinc-lead ore (78 tons) from the Horseshoe mine and copper ore (49 tons) from the Empire mine. The Federal Bureau of Mines did considerable drilling during the year at the Empire mine, and the Federal Geological Survey did some exploration.

Bayhorse district.—The Clayton mine, operated by Clayton Silver Mines, continued to be a large producer of zinc-lead ore; in 1943 about 34,500 tons of ore, containing 195,360 ounces of silver, 3,028,980 pounds of lead, 1,622,000 pounds of zinc, and a little gold and copper, were treated in the company 120-ton flotation mill. The output of ore and the production of lead and zinc were less than in 1942, but the silver output was greater. According to the company printed annual report, the labor situation at the property was fairly satisfactory until the end of May; but from that time on it was difficult to operate, and any development was out of the question if production was to be maintained. With the small number of men available and doing no development, production was still insufficient to keep the mill running at capacity; consequently, it was idle 627 hours during the year. In spite of the subnormal amount of development, the ore reserves were substantially increased during the year. The estimate now places the reserves at 80,000 tons and, in addition, 60,000 tons of probable ore to the north and below the new ore body on the 300 level.

The remainder of the district output was largely lead-silver ore (633 tons) from Salmon River Mines, lead ore (531 tons) from the South Butte mine, and copper-lead-silver ore (135 tons) from the Ramshorn mine. Some of the ore from the Ramshorn mine averaged 166 ounces of silver to the ton, 6 percent copper, and 9 percent lead.

Yankee Fork district.—Gold output in the Yankee Fork district decreased from 5,677 ounces in 1942 to 186 ounces in 1943 and silver from 16,027 to 236 ounces. These large decreases resulted from the closing in 1942 of the 8-cubic foot bucket dredge of the Snake River Mining Co. and the General Custer-Lucky Boy lode mine. The closing was due chiefly to Government regulations. Nearly all the output of the district in 1943 was high-grade gold ore (17 tons) from the Fourth of July claim and placer gold and silver from the Horse Trail property.

ELMORE COUNTY

Bear Creek district.—Lessees operated the Vishnu mine at Rocky Bar in 1943 and shipped 11 tons of ore averaging 4.5 ounces of gold and 7.5 ounces of silver to the ton.

Middle Boise (*Atlanta*) *district.*—The Middle Boise district continued in 1943 to be the largest gold-producing area in Idaho, owing to mining and milling of gold ore from the Boise-Rochester-Monarch groups by Talache Mines, Inc. The company treated 53,424 tons of gold ore in its 400-ton amalgamation and concentration mill compared with 87,747 tons in 1942 and shipped 54 tons of rich gold ore direct to a smelter. In addition to gold and silver, the milling ore contains arsenic and tungsten; in 1943, as in 1942, some tungsten concentrates were produced and marketed. The output of placer gold in the district decreased from 6,385 ounces in 1942 to 1 ounce in 1943, owing principally to the closing in October 1942 of the 7½-cubic foot bucket dredge of Boise King Placers.

GEM COUNTY

West View district.—The Friday Mining Co. operated the Friday mine at Pearl throughout 1943 and shipped 183 tons of zinc-lead ore to a custom flotation mill in Utah. The Lincoln mine, a large producer of gold ore in 1942, was idle in 1943.

IDAHO COUNTY

Elk City district.—Gold output in the Elk City district decreased from 5,901 ounces in 1942 to 10 ounces in 1943, owing chiefly to the closing of four dredges in 1942.

Ramey Ridge district.—In 1943 about 1,170 tons of gold ore from the Snowshoe mine near Big Creek were treated by amalgamation and concentration. The mine and 25-ton mill were operated the first 6 months of the year by a small crew of stockholders of Snowshoe Gold, Inc.

Ten Mile district (*Golden*).—The only output in the Ten Mile district in 1943 was 80 tons of gold ore from the Shamrock mine treated by amalgamation and concentration. However, the operating company (White Mines, Inc.) discovered tungsten in all 11 tunnels of the mine.

Warren district.—The 2½-cubic foot bucket-line dredge, operated in 1942 on Warren Meadows by W. W. Prather, was idle in 1943; 114 ounces of gold bullion were cleaned up from the dredge and sold in 1943.

LATAH COUNTY

Hoodoo district.—The Hoodoo district had an output of 6,012 ounces of gold and 329 ounces of silver in 1942 but no metal output in 1943, owing principally to the closing in October 1942, by Government order, of the 4½-cubic foot bucket dredge of Northwest Goldfields.

LEMHI COUNTY

Blue Wing district.—The Ima mine at Patterson was operated continuously in 1943 by the Ima Mines Corporation; 27,857 tons of ore, containing 52,000 ounces of silver, 100,000 pounds of copper, 139,000 pounds of lead, 557,000 pounds of iron, and some tungsten, were treated in the company 150-ton gravity and flotation mill equipped with a magnetic separator. Lead-copper-silver concentrates (946 tons) were shipped to a smelter in Utah, and tungsten concentrates were sent to an eastern market.

Gibbonsville (Dahlonega) district.—Gold output in the Gibbonsville district decreased from 4,440 ounces in 1942 to 3 ounces in 1943, chiefly because of the closing of two dredges in 1942.

Junction district.—A total of 15 tons of crude lead-silver ore was produced in 1943 from the Bullion Apex and Plymouth properties near Leadore.

Mackinaw district.—A lessee worked the Copper King mine, 8 miles south of Shoup, throughout 1943 and shipped 54 tons of crude copper ore to a smelter.

Mineral Hill district.—The Mineral Hill district had no metal output in 1943, as Gold Producers, Inc., a large producer of gold ore in 1942, was idle.

Texas district.—In 1943 about 300 tons of lead-silver ore from Latest Out mine and 145 tons of similar ore from the Hill Top mine were shipped direct to a smelter.

Unorganized (Reno) district.—Development in 1943 at the Cabin mine near Reno resulted in the shipment of 3 cars (139 tons) of crude lead-silver ore.

NEZ PERCE COUNTY

Snake River district.—Placer operators sluiced gravel bars along Snake River below Lewiston in 1943 and recovered 23 ounces of gold and 7 ounces of silver.

OWYHEE COUNTY

Carson district (Silver City, De Lamar).—The output of the Carson district in 1943 comprised 4 tons of mill cleanings, containing 50 ounces of gold and 370 ounces of silver, recovered from the De Lamar Milling Corporation mill when it was dismantled, 122 pounds of rich gold-silver ore from the South Central mine, and 1 ounce of placer gold recovered from the Long Gulch claim.

South Mountain district.—About 4,700 tons of ore, containing sphalerite, galena, and chalcopyrite, were shipped in 1943 from the Golconda mine to the International flotation mill at Tooele, Utah. The mine was operated under lease throughout the year by the South Mountain Mining Co., but the output of gold, silver, copper, lead, and zinc was much less than in 1942.

SHOSHONE COUNTY

COEUR D'ALENE REGION

In 1943 the Coeur d'Alene region of Shoshone County remained the largest silver-producing area in the United States and again ranked second in lead and third in zinc; it produced 88 percent of Idaho's silver, more than 85 percent of the copper, 93 percent of the lead, and 92 percent of the zinc. The value of the metal output of the region was $38,594,728 compared with $38,880,253 in 1942. The output of each metal except zinc decreased; gold declined 16 percent, silver 21, copper 34, and lead 16 percent. The output of zinc in 1943 exceeded the record of 1942 by nearly 2 percent. The chief producers of zinc in the region in 1943, according to rank (each producing more than

12,700,000 pounds), were the Star, Morning, Bunker Hill & Sullivan (mine), Tamarack, Bunker Hill & Sullivan zinc slag-fuming plant, and Page properties; the chief producers of lead, according to rank (each producing more than 9,000,000 pounds), were the Bunker Hill & Sullivan, Morning, Hecla, Page, Star, Tamarack, and Sherman properties; and the chief producers of silver, according to rank (each producing more than 400,000 ounces), were the Sunshine, Bunker Hill & Sullivan, Mineral Point, Hecla, Page, Morning, and Polaris properties.

Of the total material (2,270,385 tons) produced in the Coeur d'Alene region in 1943, more than 77 percent was zinc-lead ore and old tailings, 11 percent silver ore, 9 percent lead-silver ore, and the remainder nearly all zinc slag. Most mines in the region worked 6 days a week and milling plants 7 days a week. Miners' wages remained at $8.25 a shift throughout the year. The outstanding features of the year were the discovery in June of high-grade lead-silver ore in the Chester vein of the Sunshine property; the completion in April of the Bunker Hill & Sullivan zinc slag-fuming plant at Bradley and the Hecla 2,000-ton zinc-lead tailing plant at Osburn; and the marked decrease in output of silver, lead, and zinc from the Hecla mine at Burke, resulting from gradual depletion of zinc-lead-silver ore reserves.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1942–43, and total, 1884–1943, in terms of recovered metals

Year	Mines producing		Ore.	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
	Lode	Placer							
			Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1942	49	7	2,327,417	2,688	12,977,287	5,986,000	212,947,000	156,625,000	$38,880,253
1943	47	3	2,270,385	2,250	10,302,840	3,974,000	179,626,000	159,268,000	38,594,728

[1] Figures not available.
[2] Short tons.

Beaver district.—The output of the Beaver district in 1943 was 86,922 tons of zinc-lead ore and 60 tons of lead ore compared with 83,513 tons of zinc-lead ore in 1942. About 36,900 tons of zinc-lead ore from the Amazon-Manhattan-Portland groups (Monitor Mining Co.) were treated in the Hercules and Dayrock custom flotation mills near Wallace; 15,700 tons of zinc-lead ore from the Interstate-Callahan mine and 9,400 tons of similar ore from the mine waste dump were treated in the flotation mill of Zanetti Bros. near Wallace; and 24,917 tons of zinc-lead ore from the Sunset mine were treated in the Golconda custom flotation mill, also near Wallace. A total of 3,311 tons of lead-silver concentrates was shipped to lead smelters at East Helena (Mont.) and Kellogg, and a total of 8,894 tons of zinc concentrates was shipped to electrolytic zinc plants at Anaconda (Mont.) and Kellogg. The content of all ores treated averaged 1.51 ounces of silver to the ton, 0.08 percent copper, 3.20 percent lead, and 6.35 percent zinc.

Eagle district.—Lessees worked at the Crystal Lead property near Murray in 1943 and hauled 456 tons of zinc-lead ore to the Hercules mill and sold 5 tons of high-grade crude lead-silver ore to the Bunker Hill smelter.

Evolution district.—A total of 270,113 tons of ore and 127,318 tons of old tailings was treated in 1943 in the Evolution district, compared with 417,898 tons of ore and old tailings in 1942. The output comprised 141,955 tons of silver-copper-antimony ore from the Sunshine mine; 21,405 tons of high-grade lead-silver ore from the Chester vein of the Sunshine property; 78,753 tons of silver ore from the Mineral Point mine; 28,000 tons of silver ore from the Polaris mine; and 127,318 tons of old zinc-lead tailings from the Osburn dump, operated by the Hecla Mining Co. According to the printed annual report of the Sunshine Mining Co. the most important development during the year was the discovery, on the 2,700 level of the Sunshine property, of high-grade lead-silver ore in the Chester vein and fault zone. This structurally complex zone is north and east of the Sunshine vein system and had been prospected in the past by both the Sunshine and Polaris Mining Cos. on higher levels with negative results. The new discovery was made in the course of exploration undertaken at the request of the Polaris Mining Co., and subsequent work has disclosed excellent ore at various points for 600 feet on the strike and 750 feet on the dip, with the full extent of the ore zone in both strike and dip still to be determined. To avoid the complexity and particularly the delay of legal determination of rights to the ore under existing mining law, certain compromise agreements were entered into. A dividing plane was established, and two areas were created on the Chester vein. In the Rambo area west of the dividing plane, the equities in the ore are Sunshine 60 percent and Silver Syndicate, Inc., 40 percent. In the Omega area east of the dividing plane, the Sunshine and Polaris Mining Cos. have equal rights. All mining and milling of ore from the two areas will be done by the Sunshine Mining Co. The total ore mined by the company from all sources in 1943 was 163,360 tons (including 9,800 tons of lead-silver ore mined for Polaris account). This represents a decrease of 88,340 tons from 1942, due entirely to an acute labor shortage throughout the year. The silver-copper-antimony ore (141,955 tons), containing an average of 23.46 ounces of silver to the ton, 0.40 percent copper, and a little lead and antimony, was concentrated into two products—one a high-grade silver-copper-antimony concentrate, which was treated in the company leaching and electrolytic antimony plant for the recovery of antimony, and the other a low-grade silver-iron concentrate, which was shipped direct to a smelter. The residue remaining after the antimony had been leached was shipped to a copper smelter to recover the silver and copper contents. As of May 1, 1943, the Sunshine Mining Co. made a contract with the Coeur d'Alene Mines Corporation to purchase all silver-copper-antimony concentrates produced at the 600-ton flotation mill of the Coeur d'Alene Mines Corporation; since that time these concentrates have been treated along with Sunshine concentrates for recovery of the antimony. The total output of silver from the Sunshine mine in 1943 was 3,828,370 ounces compared with 4,976,859 ounces in 1942.

According to the printed annual report of the Coeur d'Alene Mines Corporation, 78,753 tons of ore were mined and treated in 1943, containing an average of 10.86 ounces of silver to the ton, 1.0 percent copper, and 0.56 percent antimony. The concentrates (2,507 tons) contained 839,610 ounces of silver, 1,551,228 pounds of copper, and 880,833 pounds of antimony—a marked decrease from the metal output in 1942. A total of 2,152 feet of drifting, raising, and crosscutting was done during the year, and the shaft was sunk from the 2,097 to the 2,282 level; the chief production is now coming from the 1,600 and 2,000 levels. The property remained the largest producer of copper in Idaho and ranked third in silver and antimony. Mining and milling of silver ore from the Polaris mine were continuous until August 30, 1943, when milling of Polaris ore ceased. Beginning September 1, the 200-ton flotation mill was used to treat zinc-lead middling produced at the Osburn tailing plant. According to the printed annual report of the Polaris Mining Co., mining of ore on the Polaris vein is being continued with the limited number of men available, but only approximately 15,000 tons of ore remained to be treated as of December 1, 1943. Some development has been carried on, but no additional ore of importance was found on the Polaris vein. About 28,000 tons of silver ore were mined and treated from this vein in 1943.

The Hecla Mining Co. completed building in April a 2,000-ton plant to treat old zinc-lead tailings at Osburn. During the remainder of the year the plant merely screened and cleaned the old tailings, as a shortage of supplies and labor delayed completion of the sink-and-float unit of the plant. The company reported that about 126,000 tons of old tailings were treated in 1943, containing an average of 1.50 ounces of silver to the ton, 1.86 percent lead, 1.93 percent zinc, and a little copper; the resulting zinc-lead middling was shipped to the Hecla and Polaris flotation mills, where it was separated into lead concentrates and zinc concentrates. A flotation unit was added to the plant late in the year, which, along with the sink-and-float unit, will be in operation early in 1944.

Hunter district (*Mullan*).—The output of recoverable zinc in the Hunter district in 1943 was 59,765,000 pounds, the greatest in any district of Idaho but a decrease of 12 percent from that in 1942; the Star mine of the Sullivan Mining Co. at Burke continued to be the chief producer. The 1,000-ton flotation mill at the mine operated throughout the year and treated 238,509 tons of ore (242,900 tons in 1942), yielding 10,266 tons of lead concentrates and 37,460 tons of zinc concentrates, which contained 240,607 ounces of silver, 16,812,000 pounds of lead, and 38,705,000 pounds of zinc. The company reported that the mill operated 7 days a week for the first 3 months of the year, when a shortage of labor in the mine compelled a reduction to 6 days a week. Mining and milling at the Morning property of the Federal Mining & Smelting Co. at Mullan were continuous in 1943. The 1,250-ton flotation mill treated 178,122 tons of mine ore containing an average of 2.3 ounces of silver to the ton, 6.5 percent lead, and 8.2 percent zinc, and 56,545 tons of waste-dump ore containing an average of 1.1 ounces of silver to the ton, 1.4 percent lead, and 1.0 percent zinc; the lead concentrates and zinc concentrates produced from both mine ore and waste-dump ore contained 192 ounces of gold, 435,614 ounces of silver, 23,160,203 pounds of lead, and 29,311,860 pounds of zinc. The metal output was much less than in 1942, owing to the treatment of waste-dump ore. According to the printed annual report of the company, the labor shortage continued during the year, and employment reached a low point during the summer months. In September some relief resulted from the furloughing of soldiers by the Army for mine work; 121 of these men were sent to the Morning mine. However, at the end of 1943 the crew was practically the same as on January 1, which is about 75 men below normal.

As the Morning mill capacity was considerably greater than was required for the treatment of mine ore, a substantial tonnage of low-grade ore from Morning dumps was treated in the mill during the last 7 months of the year. This operation proved profitable under premium metal prices.

The offset shaft was sunk an additional depth of 205 feet during the year and reached a total depth of 1,116 feet below the 3,850 level. Owing to the shortage of labor, the work of cutting the station and ore pockets and driving the crosscut to the vein on the 4,850 level has not begun. On the 4,650 level the drift westward on the vein was driven 714 feet to the west end of the Morning claim. The ore shoot on this level is 680 feet long. Ore reserves at the end of the year, including developed and probable ore in both the Morning and You Like portions of the mine, are estimated at 620,000 tons, a decrease of 60,000 tons from the estimated tonnage at the end of 1942. Lessees continued to operate the Gold Hunter mine and 500-ton flotation mill at Mullan; 52,760 tons of ore averaging 3.62 ounces of silver to the ton, 2.46 percent lead, and 0.45 percent zinc were treated in 1943 compared with 65,417 tons in 1942. The rest of the district output was largely zinc-lead-silver ore (7,072 tons) from the Lucky Friday mine, zinc-lead ore (4,571 tons) from the Golconda mine, and old waste-dump zinc-lead ore (2,000 tons) from the Simia claim. All the ore from the Lucky Friday and Golconda mines was treated in the Golconda custom flotation mill near Wallace.

Lelande district (Burke, Mace, Frisco).—The output of the Lelande district in 1943 comprised 256,732 tons of zinc-lead-silver ore and old tailings, 56,217 tons of lead ore, and 50 tons of mill cleanings. The Hecla mine at Burke continued to be the most important producer, although its output of zinc-lead-silver ore decreased from 274,938 tons in 1942 to 140,400 tons in 1943. Lead concentrates (15,026 tons) and zinc concentrates (8,106 tons) produced in the 900-ton flotation mill at the mine contained 163 ounces of gold, 544,435 ounces of silver, 132,500 pounds of copper, 22,503,600 pounds of lead, and 10,625,000 pounds of zinc, a considerable decrease from the output in 1942. According to the printed annual report of the company, operations at the Hecla mine were continuous throughout the year and will proceed upon a small output basis during the first 6 months in 1944. No new ore of importance was found in 1943, and only lack of manpower prevented complete removal of ore reserves during the year. The lack of an adequate working force and the general inefficiency of what replacements could be obtained hampered all operations and delayed all construction work. The mill, however, is operating at full capacity 7 days a week on mine ore and Osborn tailing-plant material.

The lower levels of the Frisco mine were operated throughout the year by the Federal Mining & Smelting Co. (owners of the property) and the upper levels by the Hull Lease; 31,530 tons of ore, containing an average of 1.38 ounces of silver to the ton, 4.10 percent lead, and 5.80 percent zinc, were produced on company account and treated in the Morning flotation mill, and 28,081 tons of similar ore were produced by the Hull Lease and treated in its own 90-ton flotation mill. According to the printed annual report of the Federal Mining &

Smelting Co., mining operations at the Frisco mine were continuous in 1943 upon a basis of 6 days a week. During the year the water level was lowered to a point below the 1,200 level, and the station on this level was rehabilitated; a new 350-ton ore bin was built, and the entire surface plant (consisting of mine dry house, warehouse, office, and other buildings) was enlarged and improved; a total of 1,120 feet of development was done on the 800, 1,000, and 1,200 levels. Ore reserves at the end of the year were estimated at 217,500 tons of developed and probable ore. From present indications, additional ore will be developed as the lower levels are made accessible. Mining and milling at the Sherman property were carried on throughout the year by the Sherman Lead Co. The company reported that 56,217 tons of ore were treated in its 300-ton flotation mill and contained 322,427 ounces of silver, 10,198,580 pounds of lead, and 2,340,000 pounds of zinc. According to the printed annual report of the company, no zinc concentrates were produced in 1943, but a greater economic return for zinc was secured through the content of this metal in the lead concentrates than could have been obtained in a separate mill zinc concentrate.

The Sherman mine and mill are in excellent condition, and output of ore could be quickly increased if workers were available. This lack of manpower is the most critical factor affecting company operation, and unless the present situation changes for the better the management anticipates that production in 1944 will show considerable reduction.

The Formosa mill on Canyon Creek 3½ miles northeast of Wallace was rehabilitated and equipped by the Small Leasing Co. late in 1942 with three units of flotation machines to treat old zinc-lead tailings deposited along Canyon Creek above Wallace. The mill operated continuously in 1943 and treated 46,000 tons of old tailings, containing an average of 2 ounces of silver to the ton, 2 percent lead, and 4.5 percent zinc. In addition, 8,535 tons of similar material were hauled to the Golconda custom mill for treatment. The remainder of the district output was mainly old zinc-lead tailings (1,000 tons) from the Vermillion Homestead and zinc-lead ore (880 tons) from the Poorman waste dump.

Placer Center district.—About 132,700 tons of zinc-lead-silver ore and 27,700 tons of lead-silver ore were produced in 1943 in the Placer Center district; the principal producer was the Tamarack mine operated throughout the year by the Tamarack & Custer Consolidated Mining Co. According to the printed annual report of the company the Tamarack mine was operated upon a basis of 6 days a week and the 400-ton flotation mill upon a basis of 7 days a week; 114,073 tons of ore were produced and treated, containing 180,317 ounces of silver, 10,746,110 pounds of lead, and 19,487,046 pounds of zinc. In addition, lessees shipped 64 tons of high-grade lead-silver ore direct to a smelter and hauled 4,730 tons of zinc-lead-silver ore to custom flotation mills. An average crew of more than 200 men is required at the Tamarack mine to maintain normal production and development. At no time during 1943 were so many workers available, and the present shortage is about 25 percent. In September 1943 the War Department recognized the seriousness of the situation and furloughed several hundred soldiers to the district; the Tamarack allotment was 72. The mine and mill are in good physical condition and are prepared for maximum production in 1944. A shortage of labor is again anticipated, however, and this present and potential lack of manpower is the most critical factor affecting the company output. Unless totally unforeseen conditions develop, the management believes that the operations in 1944 will continue at about the same rate as in the past year.

The Dayrock Mining Co. operated its mine and 200-ton flotation mill continuously in 1943; 27,556 tons of silver-lead ore were produced and treated. According to the company printed annual report the ore contained 148,399 ounces of silver, 3,681,378 pounds of lead, and 521,200 pounds of zinc; however, the mill produced only one product—a silver-lead concentrate; thus, no zinc was recovered. Exploration during the year was confined principally to the 400 and 500 levels, the lowest in the Dayrock mine. Following successful diamond drilling on these levels, a new vein, designated as the "South," was developed by crosscutting and drifting during the latter part of 1943. Although the ore discovered in this vein is not continuous and averages lower in grade than the mill feed produced heretofore, the "South" vein promises to yield a substantial tonnage of ore in the future.

The Callahan Consolidated Mines Co., operating the Red Monarch, Rex, and Delaware groups near Wallace, completed building a 100-ton flotation mill in February 1943. During the remainder of the year the mill treated about 11,900 tons of zinc-lead ore; lead concentrates (327 tons) were shipped to the Bunker Hill lead smelter and zinc concentrates (545 tons) to the Sullivan zinc plant. The rest of the district output was 2,107 tons of zinc-lead ore from the Success mine, operated by lessees.

Yreka district (Kellogg).—A total of 772,246 tons of ore, old tailings, and slag was treated in 1943 from properties in the Yreka district—the largest output in any district of Idaho and an increase of 8 percent over 1942; most (87 percent) of it was zinc-lead ore and old tailings. The Bunker Hill & Sullivan mine at Kellogg, with an output of 360,908 tons of zinc-lead-silver ore, was the principal producer, although its output was 12 percent less than in 1942. In addition, the company treated 42,480 tons of old jig tailings (containing silver, lead, zinc, and iron) in a 300-ton gravity-flotation plant especially built to treat this material. The mill produced two products—a high-grade iron concentrate and a low-grade lead-iron concentrate. The company main 1,700-ton gravity-flotation mill, equipped with a sink-and-float unit, treated 360,908 tons of ore from the Bunker Hill & Sullivan mine (containing an average of 4.31 ounces of silver to the ton, 6.73 percent lead, 3.59 percent zinc, and a little copper) and 38,383 tons of old tailings from the Sweeny dump (containing 0.74 ounce of silver to the ton, 1.74 percent lead, and 1.06 percent zinc); E. G. Smith operated a portion of the Sweeny tailing dump during 1943 and treated about 28,000 tons of similar material in the Crescent flotation mill, which he is leasing. The Bunker Hill & Sullivan mine remained the largest producer of lead in Idaho and ranked second in silver and third in zinc. According to the company printed annual report there were produced and recovered from Bunker Hill mine ore (including 12,250 tons of lessee ore) 1,409,566 ounces of silver, 46,650,000 pounds of lead, and 22,440,000 pounds of zinc. The bottom level of the mine, 2,800 feet vertically below the Kellogg adit tunnel and 400 feet below sea level, is the practical working limit of the present company hoisting equipment, which has given excellent service for nearly 20 years. Because of this, a new hoist has been purchased and is now being installed; it should be in operation before the end of 1944. This new hoist will give, as a minimum, an additional working depth of 1,200 vertical feet. Underground development was confined to the addition of ore bodies in currently mined areas, particularly the Truman vein on 21 and 23 levels. Ore reserves January 1, 1944, undercut and available for mining, totaled 2,874,771 tons of zinc-lead-silver ore. Operations at the zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley began in April. During the remainder of the year the plant treated 55,976 tons of hot current slag and 23,482 tons of old reclaimed dump slag, but only the old dump slag and 15,983 tons of the hot slag were credited directly to the fuming-plant operation. Zinc recovered from this new source substantially increased in 1943 the total output of zinc in the Yreka district.

Mining and milling of zinc-lead-silver ore from the Blackhawk and Page mines by the Federal Mining & Smelting Co. were continuous throughout the year. The company reported that 141,460 tons of ore from the Page mine and 12,621 tons of ore from the Blackhawk mine, containing 619,405 ounces of silver, 24,159,800 pounds of lead, and 18,520,000 pounds of zinc, were treated in the Page 500-ton flotation mill. According to the printed annual report of the company the labor shortage experienced by most of the companies in the Coeur d'Alene region caused a loss of about 10 percent of the Page crew during the summer months; however, the crew is now (Jan. 1, 1944) normal. The drift east and west on the Tony vein in the Page mine on the 2,400 level was driven 425 feet in 1943. The ore shoot found on this level is 1,890 feet long and of good average width and excellent grade. Ore reserves at the end of the year were estimated at 655,000 tons of developed and probable ore, a decrease of 20,000 tons from the estimated tonnage at the end of 1942. About 21,500 tons of zinc-lead ore from the Spokane-Idaho property (Constitution) were treated in 1943 in the company 100-ton flotation mill, which produced zinc-lead concentrates. The company made preparations to sink the three-compartment shaft to the 1,000 level. Mining and milling operations were carried on continuously at the Little Pittsburg mine by the Denver Development Co. until July 14, 1943, when a dynamite explosion caused a fire that completely destroyed the surface buildings and suspended operations until August 25. Reconstruction and equipment of the buildings were virtually completed by the end of the year. A total of 20,069 tons of zinc-lead ore was treated during the year in the company 100-ton flotation mill and the Amy-Matchless mill. The Highland-Surprise Consolidated Mining Co. operated its mine and mill from April 1 to the end of the year; the 150-ton flotation mill treated 18,130 tons of zinc-lead ore yielding 3,576 tons of zinc-lead concentrates. The Small Leasing Co. completed building in August a new 100-ton flotation mill at the Douglas mine on Pine Creek; during the remainder of the year the mill treated 12,789 tons of zinc-lead ore yielding 1,727 tons of zinc-lead concentrates. The output from the rest of the district was principally old tailings (silver-lead) (8,649 tons) from the Sierra-Nevada property, old zinc-lead tailings (7,500 tons) from Brown Flats near Kellogg, and zinc-lead-silver ore (7,265 tons) from the Sidney mine on Pine Creek.

VALLEY COUNTY

Deadwood Basin district.—Mining and milling were continuous throughout the year at the Hall-Interstate property, operated by the Callahan Zinc-Lead Co. The company reported that 18,934 tons of zinc-lead-silver ore were treated by flotation in 1943, yielding 539 tons of silver-lead-copper concentrates and 1,358 tons of zinc concentrates.

Yellow Pine district.—The open pit at the Yellow Pine mine at Stibnite was worked continuously in 1943 by the Bradley Mining Co.; 178,747 tons of ore (containing an average of about 0.04 ounce of gold and 1.16 ounces of silver to the ton, and some antimony and tungsten) were treated in the company 600-ton flotation mill and yielded both high-grade and low-grade tungsten concentrates, 8,027 tons of antimony-silver-gold concentrate, and 1,902 tons of gold-silver-antimony-iron concentrate. The property was the largest producer of antimony and tungsten in Idaho in 1943 and ranked third in gold.

WASHINGTON COUNTY

The only output in Washington County in 1943 was 107 tons of crude silver-copper ore from the Egan and Silver Still mines in the Washington (Mineral Creek) district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN MONTANA

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY

Copper remained the chief source of metal value in Montana in 1943, representing about two-thirds of the State total, and was the only metal to show an increase. The total value of the gold, silver, copper, lead, and zinc produced from Montana ores and gravels was, in terms of recovered metals, $53,642,658 in 1943, compared with $60,129,853 in 1942. (See fig. 1.) This decrease was due to smaller output of each metal, for, although the average prices paid for copper, lead, and zinc were all higher than in 1942, only the value of copper output showed a gain. Gold and silver production was cut drastically by the further closing of gold mines in Montana. Production of lead and zinc declined owing to the idleness at the Anaconda Copper Mining Co. zinc mines at Butte and to the closing of two of the formerly large zinc and lead producers. The tonnage of copper material treated was greater than in 1942, but a relatively larger part of the total tonnage was from dumps, old tailings, and old slime ponds. Silver Bow County, which yielded virtually all the copper output of the State and most of the silver, produced gold, silver, copper, lead, and zinc valued at $42,100,656 in 1943, compared with $46,942,464 in 1942. The decrease was the net result of smaller output of all metals by the Anaconda Copper Mining Co.

Maximum base-metal output from mines in Montana was not reached in 1943, principally because of labor shortages which were particularly acute during summer months and prevailed throughout the mining districts of the State. To alleviate this shortage, the Army again furloughed soldiers for work in the base-metal mines. Of the total soldiers released in 1943, the Anaconda Copper Mining Co. received 800 for work in the copper mines at Butte.

The Government policy of premium payments for overquota production of base metals was in force throughout 1943; however, the War Production Board took certain steps to restrict the output of marginal producers. The Board acted because of increased mineral production, revised military requirements, a greater need for marginal manpower than marginal minerals, and the success of efforts toward balancing supply with the requirements of the armed forces and the most essential civilian needs. Accordingly, the following actions were taken: On October 27, the Board announced that premium prices in the B and C ranges for zinc mines and the B range for lead mines had been denied to mines not already operating or to mines having a low labor productivity and in areas of serious labor shortage; and that the Government would not finance new zinc projects. On November 9, it announced that, effective December 31, no consideration would be given to applications for the special copper premiums under the plan effective since May 1, 1943.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67 + ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Montana, 1939–43, and total, 1862–1943, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

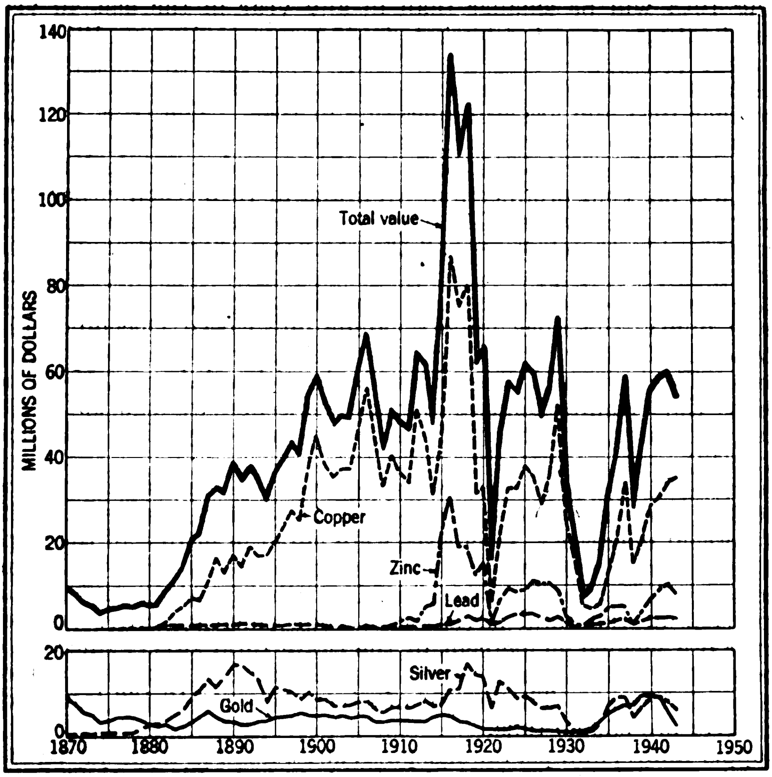

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Montana, 1870–1943.

Gold.—Montana ores and gravels yielded 59,586 fine ounces of gold in 1943, compared with 146,892 ounces in 1942—a 59-percent decrease; the output from lode mines decreased 60,136 ounces and from placer mines 27,170 ounces. Siliceous ores yielded 46 percent of the State total gold, and base-metal ores 30 percent; there was a decrease in gold from each class of ore. Gold production from every county in the State except Flathead and Judith Basin showed a decrease, but both of these counties are of negligible importance as gold producers. The largest decreases were noted from mines in Madison, Broadwater, Jefferson, Park, Lewis and Clark, Silver Bow, and Granite Counties. Gold ore mined totaled 72,616 tons, compared with 322,140 tons in 1942, and comprised 34,926 tons treated in amalgamation and cyanidation mills, 12,666 tons in concentrating mills, and 25,024 tons shipped crude to smelters. Ore treated at amalgamation and cyanidation mills (with or without concentrating equipment) yielded 16 percent of the State total gold; ore concentrated, 32 percent; ore of all classes shipped crude to smelters, 28 percent; and placers, 24 percent.

Virtually all gold mines in Montana were closed by the end of 1943; only those remained active that could justify their operation by reason of supplying smelters with much-needed flux. From records based upon the first 4 months of 1944, gold production in Montana during 1944 will be smaller than in any year in the last 40 years. Three floating connected-bucket dredges were active in 1943; however, one of these—Porter Bros. Corporation dredge—ceased operations August 8, 1943. The other two remained in operation through December 1943 and are still operating in 1944. The H. & H. Mines Co. dredge recovers gold and scheelite, and the Perry-Schroeder Mining Co. dredge recovers gold, sapphires, and some platinum.

The leading gold producers in Montana in 1943 (each either closed during 1943 or active in 1944 only because of special product mined or contained in the ore) were all the company-operated copper mines of the Anaconda Copper Mining Co. at Butte, the Perry-Schroeder dredge (gold and sapphires) on the Missouri River in Lewis and Clark County, the Boaz mine (cyanide mill closed December 1943) in Madison County, the Golden Sunlight mine (siliceous flux) in Jefferson County, the Porter Bros. dredge (closed August 1943) near Helena, the Granite-Bimetallic mine (siliceous tailings as flux) in Granite County, and the Ohio Keating mine (cyanide mill closed July 1943).

Silver.—The output of recoverable silver in Montana in 1943 was 8,450,370 fine ounces, compared with 11,188,118 ounces in 1942—a 24-percent decrease. Decreases were noted in nearly all the important silver-producing counties; the largest were in Silver Bow, Cascade, Granite, and Flathead. Ore treated at concentrating mills yielded 84 percent of the total silver, and crude smelting ore 15 percent. Copper ore yielded 71 percent of the State total silver; siliceous ore 15 percent; zinc-lead ore 12 percent; and lead ore, zinc ore, and placers together 2 percent. The output of silver ore was 140,466 tons and of gold-silver ore 53,890 tons.

Copper mines, dumps, tailings piles, and slime ponds (at Anaconda), zinc mines at Butte, and the Flathead mine in Flathead County—all operated by the Anaconda Copper Mining Co.—produced 78 percent of the total silver in 1943. Other large producers included the Emma mine at Butte (all byproduct silver), the Granite-Bimetallic mine (tailings) in Granite County, the St. Joseph Lead Co. property (zinc-lead ore) (closed in October 1943) in Judith Basin County, the Mike Horse mine (zinc-lead ore) in Lewis and Clark County, and the Elkhorn mine dump in Jefferson County.

Copper.—Copper produced in Montana in 1943, in terms of recovered metal, was 269,050,000 pounds, compared with 282,388,000 pounds in 1942—a 5-percent decrease. The Anaconda Copper Mining Co., which again was the only important copper producer in Montana, treated a greater tonnage of copper material in 1943 but of lower copper content. All the copper mines at Butte are owned and operated by the Anaconda Copper Mining Co. except the property of the North Butte Mining Co., which, in 1943, was operated by the Anaconda Copper Mining Co. through contract agreement. Copper produced from all sources at Butte decreased, except that derived from the treatment of mine dumps and special waste; however, the output of copper from such sources is comparatively small. Copper derived from the treatment of Old and New Works tailings and slime ponds at Anaconda increased. Virtually all the waste materials at Anaconda were derived from the treatment of ore from copper mines at Butte. Copper ore and precipitates yielded gold, silver, and copper valued at $39,330,234, or 73 percent of the total State value.

Lead and zinc.—Both quantity and value of the production of lead and zinc in Montana, in terms of recoverable metal, decreased in 1943—zinc fell 31 percent in quantity and 20 percent in value and lead 19 percent in quantity and 9 percent in value; virtually the entire decrease in lead and all of that in zinc in 1943 were attributable to the closing on May 25, 1942, of all zinc mines at Butte operated by the Anaconda Copper Mining Co., as the output of lead from all other sources in Montana was nearly the same as in 1942 and that of zinc increased. The slag-fuming plant at East Helena, operated by the Anaconda Copper Mining Co., showed an increase of about 731,000 pounds in lead and 7,950,000 pounds in zinc. The Emma mine, operated by the Anaconda Copper Mining Co. under lease, showed a decrease of about 413,000 pounds in byproduct lead and about 1,817,000 pounds in zinc; no zinc-lead ore was mined in 1943.

The leading sources of zinc in 1943, named in order of output, were the slag-fuming plant at East Helena (64 percent of the State total), the Emma byproduct zinc, the Poulin mine at Butte, the Silver Cable mine in Mineral County, the Mike Horse mine in Lewis and Clark County, all Anaconda Copper Mining Co. zinc mines at Butte, the St. Joseph Lead Co. property in Judith Basin County, the Mount Washington mine in Jefferson County, and the Victoria Mining Co. property in Madison County; these nine sources supplied 95 percent of the State total.

The leading lead producers in 1943 were the Emma byproduct lead, the Mike Horse mine in Lewis and Clark County, the slag-fuming plant at East Helena, the St. Joseph Lead Co. property in Judith Basin County, the Jack Waite mine in Sanders County, the Mount Washington mine in Jefferson County, the Victoria mine in Madison County, the Elkhorn mine dump in Jefferson County, and the Hecla slag dump in Beaverhead County; these nine sources contributed 77 percent of the State total.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Beaverhead	15	1	1, 133	$39, 655	74, 205	$52, 768

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

The Bureau of Mines gave engineering assistance and performed development and exploration on several mines in Montana. Exploratory work consisted mainly of diamond drilling and drifting to explore extensions of and to develop known mineral-bearing zones. Several thousand tons of copper ore and zinc-lead ore were made available through this work.

Although the Anaconda Copper Mining Co. treated a slightly smaller quantity of crude ore from all copper mines at Butte than in 1942 it treated a greater quantity of waste dumps, tailings, and slimes, and the copper, gold, and silver content of all material treated was generally lower than in 1942. Furthermore, there was no regular output from all zinc mines at Butte in 1943. As a net result of these deficiencies, the State output of copper, lead, and zinc was adversely affected. The closing of many mines producing siliceous ores and the curtailment of production at others, plus a smaller production from mines at Butte, caused the silver production of the State to decrease. Gold lode and placer mines continued to close throughout Montana in 1943, causing a further sharp drop in gold production. Metals from ores amalgamated and cyanided declined in 1943. A greater tonnage of crude ore was smelted direct, but the gold and silver content was substantially smaller than in 1942.

Decreases of 27,170 ounces in gold and 5,587 ounces in silver were noted in the yield from placer mines. Three connected-bucket floating dredges were active in 1943; they treated 3,215,759 cubic yards of gravel and recovered gold valued at $475,265, indicating an average recoverable gold value of 14.8 cents per cubic yard treated. No dragline floating or dry-land dredges were active in Montana in 1943.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Montana in 1943, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	70	72, 616	21, 294	26, 069	195, 528	177, 511	----------
Dry and siliceous gold-silver ore	24	53, 890	3, 874	267, 433	131, 037	717, 178	15, 000
Dry and siliceous silver ore	47	140, 466	2, 216	1, 006, 598	1, 216, 499	2, 375, 803	----------
	141	266, 972	27, 384	1, 300, 100	1, 543, 064	3, 270, 492	15, 000
Copper ore	14	5, 068, 865	14, 355	6, 012, 808	[1] 265, 784, 878	----------	----------

[1] Includes 4,369,199 pounds recovered from precipitates.

[2] Includes 225,261 tons of current slag fumed.

[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

[4] Includes 5,327,407 pounds recovered from precipitates.

METALLURGIC INDUSTRY

The 5,873,016 tons of ore produced from Montana lode mines in 1943 were treated as follows: 3,346 tons at amalgamation mills, 31,580 tons at cyanidation mills, 5,327,448 tons at concentrating mills, 285,381 tons shipped direct to smelters, and 225,261 tons of slag fumed.

Two cyanide-concentration mills and one straight cyanide mill were active in Montana in 1943. One mill reported that 10,730 tons of gold ore were treated, consuming 14,000 pounds of sodium cyanide, 6,000 pounds of zinc dust, and 96,831 pounds of lime. The three cyanide mills—both with and without concentrating equipment—reported a total of 31,580 tons of gold ore treated, which contained 9,908 ounces of gold and 4,465 ounces of silver; 4,824 ounces of gold and 1,560 ounces of silver were recovered from cyanide bullion, and 4,269 ounces of gold and 1,663 ounces of silver were recovered from concentrates, indicating a total over-all recovery of 92 percent of the gold and 72 percent of the silver.

A total of 5,327,448 tons of ore of all classes was treated in straight concentration plants in 1943, compared with 4,977,953 tons in 1942. The 1943 total comprised 44,451 tons of siliceous ores, 4,988,691 tons of copper ore, 208 tons of zinc ore, and 294,098 tons of zinc-lead ore.

The Anaconda Copper Mining Co. operated its electrolytic zinc plants at Anaconda and Great Falls without interruption in 1943. The Anaconda section had 5 units and the Great Falls section, 10 units. The total rated capacity of the 15 units is about 245,000 tons of slab zinc per year. In 1943, the average unit production in slab zinc per month was about 2,721,500 pounds; in addition, zinc dross was produced at a rate of about 31,200 pounds of contained zinc per unit per month, making a total of 2,752,700 pounds of zinc per month. The dross was sold to other plants for their use. Zinc concentrates were received and treated from most of the Western States, but chiefly from Idaho, Utah, Montana, Washington, Nevada, New Mexico, and California. In addition to domestic concentrates treated, the Anaconda and Great Falls plants treated about 264,000 tons of zinc concentrates from foreign sources, chiefly upon a toll basis, for accounts of the Metals Reserve Co., United States Smelting, Refining & Mining Co., and American Zinc Co. These concentrates originated from mines in Canada, Mexico, Peru, Chile, and Australia, as follows: Canada, 32,000 tons; Mexico, 114,000; Peru, 22,000; Chile, 31,000; and Australia, 65,000 tons.

The Metals Reserve Co. maintains a stock pile of zinc concentrates at Anaconda, which are received into the Anaconda Copper Mining Co. account as smelting capacity permits. At Anaconda the copper smelter operated continuously in 1943. The company has three concentrating units at Anaconda—a copper concentrator with a rated capacity of about 12,320 tons of ore per day, a zinc concentrator with a rated capacity of 2,000 tons per day, and a slime-disintegrating plant (new in 1943) with a daily rated capacity of 1,500 tons. The copper concentrator is divided into two mills—the west mill and the east mill; the west mill has three identical sections, and the east mill has four sections; both mills treated only copper material in 1943. The zinc concentrator treated zinc-lead ore, both company and custom; sulfide concentrates from manganese ores; and, when not treating zinc ores, the crushing and grinding equipment was used for treatment of copper mine dumps from Butte. The slime-disintegrating plant treats slime deposits. The American Smelting & Refining Co. operated its lead smelter at East Helena continuously in 1943, except for a brief period in October when the plant was shut down, principally for repairing and cleaning the flue systems.

Details of the treatment of all ores produced in Montana in 1943 are given in the tables that follow.

Mine production of metals in Montana in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	757	273	18			
Ore and old tailings cyanided	16,623	4,824	1,560			
Concentrates smelted [1]	585,456	23,469	7,118,583	257,818,920	22,230,145	25,907,192

BEAVERHEAD COUNTY

Argenta district.—Old smelter slag containing appreciable quantities of silver, copper, and lead was shipped crude to the Midvale (Utah) concentrator from the Annie Placer in 1943 by L. D. Foreman. The Ferdinand mine was operated from January through November, during which period zinc-lead ore was shipped to the Midvale (Utah) concentrator. The remainder of the production in the Argenta district in 1943, all of which was shipped crude to smelters, comprised lead ore from the Iron Mountain, Louis Phillip, Goodreen, Copper Bell, and Sylvia mines, and copper ore from the Goldsmith mine.

Bannack district.—Production from the Bannack district in 1943 comprised siliceous gold ore from the Pioneer and the Bannack Apex mines shipped crude to the Anaconda copper smelter and some mill cleanings high in gold shipped to East Helena.

Bryant district.—A total of 12,454 tons of siliceous gold ore, silver-lead tailings, lead ore, and zinc-lead slag was shipped crude to Montana and Utah smelters in 1943 from the Hecla mine and dump by L. D. Foreman. Included in the total output were 8,892 tons of old smelter slag containing 8.3 percent zinc and 3.9 percent lead plus minor quantities of copper, silver, and gold. The slag was smelted first in the Tooele (Utah) lead blast furnace; the resultant slag was then treated in the slag-fuming furnace at Tooele for recovery of zinc oxide fume. Although a loss of about $5 per ton of material at the smelter was sustained by the shipper, the premium payments for lead and zinc were high enough to make the operation profitable.

Horse Prairie Creek or Colorado district.—Lead ore was shipped crude to East Helena in 1943 from the H & S mine. The Gold Leaf placer on Jeff Davis Creek was operated by sluicing from April to December 1943 and yielded the only placer gold produced in the Horse Prairie district.

Vipond district.—Highly siliceous silver ore, some of which contained enough silica for use as convertor flux, was shipped crude to the Anaconda copper smelter from Quartz Hill Mines in 1943. The remaining output from the Vipond district was crude silver ore shipped direct to smelters from the Monte Cristo and Faithful properties.

BROADWATER COUNTY

Beaver district.—The value of the metal output in 1943 from mines in the Beaver district was virtually the same as in 1942. In 1943, as in 1942, the major part of the production came from the East Pacific and East Pacific Tunnel No. 4. Lead ore and zinc-lead ore, both rich in gold, were shipped to East Helena and the Anaconda zinc concentrator, respectively. Gold ore from the Vosburg property was shipped crude to East Helena. Other production in the district included crude ore shipped direct to smelters, principally from the Edna #2, Custer Group, and Silver King mines.

Cedar Plains district.—The M & M Mining Co. operated its Ohio Keating property until July 25, 1943, when closed by Government order. During the period of operation, the company treated 15,032 tons of gold ore in its 100-ton cyanidation-concentration mill and produced 1,955 tons of gold concentrates, which were shipped to East Helena; and in addition, cyanide bullion was produced that yielded 1,109 ounces of fine gold and 248 ounces of silver. The remainder of the production from the Cedar Plains district in 1943 comprised crude lead ore shipped direct to East Helena from the Dandy Group, North Star Group, Santa Anita claim, Ruby Silver, and Cleo mines, and crude siliceous ores shipped direct to East Helena, chiefly from the Ruby Silver mine.

Park or Indian Creek district.—The Broadwater Zinc & Lead Co. built a 50-ton flotation mill in 1943 on its Iron Mask property and treated approximately 1,200 tons of zinc-lead ore. In addition, the company shipped 1,612 tons of silver ore direct to smelters. Gold ore from the Marietta mine shipped crude to East Helena amounted to 215 tons and contained 316 ounces of gold and 924 ounces of silver. The Diamond Hill amalgamation mill, which was increased to 30-ton capacity, treated 556 tons of gold ore in 1943 from the Diamond Hill mine. Other production included crude gold ore shipped direct to East Helena from the Erickson mine dump and gold ore amalgamated from the Silver Star mine.

CASCADE COUNTY

Barker district.—The only production in 1943 from the Cascade County section of the Barker district was zinc-lead ore from the Fairplay mine, which was shipped to the Midvale (Utah) concentrator for treatment. The property was operated throughout 1943.

Montana district.—The value of the metal output in 1943 from the Montana district was about one-third of that in 1942. The production of all metals showed very substantial decrease in 1943, particularly the silver and gold. The Klies Mining Co. operated its Broadwater group and its 80-ton flotation mill until June 5, when all operations ceased. On July 1, the holdings and assets of the Klies Mining Co. were purchased by the Neihart Mine & Milling Co., which continued operation of the mine and flotation mill during the rest of 1943. Zinc-lead ore from the Broadwater group, treated by the two companies, in 1943 aggregated 12,628 tons compared with 23,783 tons in 1942. The zinc-lead ore treated by the Neihart Mine & Milling Co. had an average content of 2.6 ounces of silver to the ton, 2.6 percent lead, and 3 percent zinc. Ore production was substantially reduced during the latter half of 1943 by shortage of labor.

The Florence Mining Co. operated its Florence mine until April 1943; however, the company 50-ton flotation mill was operated until June 30. During the 6-month period, the company treated about 3,500 tons of silver ore and made lead concentrates rich in silver, which were shipped to East Helena. The company was by far the most important producer of silver in the district in 1943. After operations were suspended June 30, all equipment was sold to the Bennett Mining Co. of Neihart, Mont. The Lexington Mining Co. treated about 3,000 tons of silver ore from its Big Seven mine in its 100-ton flotation mill; the silver concentrates produced contained approximately 1,700 ounces of silver to the ton and were shipped to East Helena. The company ceased operations after July 1943. After the Lexington Mining Co. suspended operations, it leased its mine and mill to the Montana Leasing Co., which treated in the mill 6,460 tons of silver dump ore from the Ripple mine and 5,584 tons of silver ore from the Benton group. A total of 410 tons of silver-lead concentrates was produced. The New London Mining Co. treated about 9,000 tons of silver ore from its Star mine in its 40-ton flotation mill, making 395 tons of lead concentrates rich in silver that were shipped to East Helena. Other production in the Montana district in 1943 included silver ore from the Graham-Hollowbush group concentrated in the Klies Mining Co. mill, crude lead ore shipped to East Helena from the Lizzie property, and zinc-lead ore shipped to the Midvale (Utah) concentrator from the Champion B mine.

FERGUS COUNTY

North Moccasin district.—The North Moccasin Mines Syndicate operated its Barnes-King open-cut mine and 200-ton cyanide mill during January 1943; after this brief period of operation, the property was closed.

Warm Springs district.—A test lot of crude gold ore was shipped in 1943 from Globe mine to the East Helena smelter.

FLATHEAD COUNTY

Hog Heaven district.—Siliceous silver ore shipped crude to the Washoe Sampling Works at Anaconda in 1943 comprised the only output from the Hog Heaven district. The Flathead and West Flathead mines, owned and operated by the Anaconda Copper Mining Co., produced a total of 20,437 tons of silver ore, virtually the entire output of the district.

GRANITE COUNTY

Boulder and South Boulder district.—A lessee operated the Saranac mine from April 16 to August 2, 1943, and treated 170 tons of zinc-lead ore in the 30-ton Saranac flotation mill. A bulk silver-lead-zinc concentrate was produced, which was shipped to the zinc smelter at Anaconda.

Dunkleberg district.—All the output of the Dunkleberg district in 1943 was zinc-lead ore from the Forest Rose, Wasa, and Monarch mines, operated under lease by the Forest Rose Syndicate. The bulk of the production in 1943, however, came from the Forest Rose mine. During the summer months, shortage of manpower became so acute that the management suspended all milling operations for about a month and used the mill men for underground mining and development. A substantial quantity of oxide ore encountered in the development of the properties caused a lower-than-normal mill recovery. In September, a new hoist was installed at the Forest Rose mine. The 80-ton flotation mill was operated throughout 1943, except during the brief shut-down in the summer. An aggregate of 22,537 tons of mine ore and dumps that averaged about 2.7 percent lead and 3.4 percent zinc was treated in 1943, compared with a total of 22,500 tons with about 4 percent lead and 4 percent zinc treated in 1942. The output of zinc and lead concentrates produced was considerably smaller than in 1942.

First Chance district.—A test lot of crude copper ore was shipped direct to the Washoe Sampling Works at Anaconda in 1943 by the Consolidated Mining Co. from the Queen Helen mine of the Mitchell group. The company, a recent incorporation, spent most of the year in development preparatory to mining commercial copper ore in 1944.

Some placer gold was recovered in 1943 by sluicing from stream gravels.

Flint Creek district.—Old tailings from the Granite-Bimetallic dumps continued to be the chief source of metal production in the Flint Creek district in 1943. The Philipsburg Mining Co. was liquidated, and all holdings were purchased by J. C. and Juanita Yob. In 1943 the old tailings were mined and treated in a 400-ton washing and desliming plant; the resulting product was shipped crude to Tacoma and East Helena smelters, to be used there as flux. The Trout Mining Division of American Machine & Metals, Inc., produced chiefly manganese ore in 1943; however, some sorted crude lead, silver, and gold ore was shipped direct to smelters. Joseph T. Farrow, lessee of the Patten Mining Co., operated the Two Per Cent property intermittently in 1943 and shipped crude silver ore to the Washoe Sampling Works at Anaconda and zinc-lead ore to the Anaconda zinc concentrator. The remainder of the output from the Flint Creek district comprised crude ore shipped direct to smelters and came chiefly from the Silver Prince and Comanche Extension mines.

Henderson district.—Gold and scheelite were recovered in 1943 from gravels of Henderson Creek Gulch by dredging. In 1942 H. & H. Mines dismantled its all-electric Yuba (65 3½-cubic foot bucket) dredge, which had been operating on Crooked River near Elk City, Idaho, and moved it to a point on Henderson Creek about 17 miles south of Drummond, Mont. The bucket dredge was reassembled, and active operations were begun on May 2, 1943, and were continued throughout the rest of the year. During the period of operation, 601,809 cubic yards of gold-tungsten-bearing gravels were washed, resulting in the recovery of 1,991 fine ounces of gold, 135 ounces of silver, and some tungsten; the aggregate value of the metals produced was about $100,000. The scheelite in the gravel is derived from a large body of contact-metamorphic rock cut by the canyon of Henderson Creek. Grains of scheelite occur in quartz seams in this rock and are liberated by erosion, eventually becoming concentrated in the stream gravel.

Maxville district.—Lead ore shipped direct to East Helena from the Snow Cap mine was the only output from the Maxville district in 1943.

JEFFERSON COUNTY

Amazon district.—Crude lead ore from the East Mint and Evening Star mines and old gold-silver tailings from the Boulder mine, all shipped direct to East Helena in 1943, comprised the output from the Amazon district.

Boulder and Little Boulder district.—Lead ore from the Summit and Buckhorn mines and silver ore from the Baltimore mine were shipped crude to smelters in 1943.

Cataract district.—Many operations were active in the Cataract district in 1943. R. N. Shute and partners shipped about 2,600 tons of siliceous gold-silver tailings from the Bluebird tailings dump to East Helena for flux. O. O. Alexander shipped 516 tons of zinc-lead ore to the Midvale (Utah) concentrator from the Aurora mine. The Golden Messenger Corporation exercised its option on the Crystal group of mines early in 1943; production amounted to a car of gold-silver ore shipped crude to the Washoe Sampling Works at Anaconda and a car of zinc-lead ore shipped to the Midvale (Utah) concentrator. Among other mines active in 1943 were the Grey Eagle (dump), Copper Bell, Big 4 (dump), Bullion (dump), Morning Glory, Hope, and Eva May.

Colorado district.—The value of metal production from the Colorado district gained 21 percent in 1943 compared with 1942; the output of each metal except gold and copper increased. The Monongahela-Mount Washington Mining Co. operated its Mount Washington property throughout the year, compared with only about 9 months of operation in 1942. During 1943, the company treated about 43,000 tons of zinc-lead ore in its 150-ton flotation mill. The lead concentrates produced were shipped to East Helena, and the zinc concentrates to Amarillo, Tex., for smelting. In addition to the zinc-lead ore milled, the company shipped about 4,800 tons of crude gold-silver ore direct to East Helena. Henry Lancaster, lessee on the dump of the Minah mine, shipped about 6,700 tons of crude gold-silver ore direct to East Helena. The dump material was sold at 50 cents a ton regardless of the assay value of the metals contained. Other production in the Colorado district in 1943 included crude ore shipped to smelters from the Alta, Blue Bird, and Good Hope properties.

Elkhorn district.—The Elkhorn dump was the chief source of metal production in 1943 from the Elkhorn district. A power shovel was used to load the old tailings which were shipped direct to East Helena, there to be used as flux. The material contained an average of 6.9 ounces of silver to the ton, 2.1 percent lead, and 3.0 percent zinc, with minor quantities of gold and copper. The operation was profitable only because of the premium payments received from the Government. Crude ore was shipped direct to East Helena from the Klondyke and Silver Crescent mines.

Montana City district.—A little crude ore was shipped in 1943 to East Helena from the Our Ticket 45 and Margrate mines.

Warm Springs district.—Gold ore shipped crude to East Helena from the War Eagle mine comprised the output in the Warm Springs district in 1943.

Whitehall district.—Marvin Reibhoff operated the Golden Sunlight mine throughout 1943 and shipped over 15,000 tons of highly siliceous gold ore direct to the Washoe Sampling Works at Anaconda. The average silica content of the ore was about 72 percent, sufficient to be of use as convertor flux at the Anaconda copper smelter. A lessee shipped 539 tons of lead ore direct to East Helena from the Perhaps mine. The rest of the district production was crude ore shipped direct to smelters and included siliceous ore from the Lucky Hit and Leah mines and lead ore from the Carbonate, Surprise, Midnight, and Parrott mines.

Wilson and Ticer Creeks district.—Gold ore shipped crude to a smelter, gold ore amalgamated from the Callahan group, and lead ore shipped crude to a smelter comprised the output from the Wilson and Ticer Creeks district in 1943.

JUDITH BASIN COUNTY

Barker district.—Virtually the entire output of the Barker district in 1943 came from the operation of the St. Joseph Lead Co. at its

Block P property. The company operated its property and 400-ton concentrator from January 1 until October 28, 1943, when the property was closed by Government order. During the period of operation, the company treated 33,301 tons of ore containing an average of 7.5 ounces of silver to the ton, about 4.5 percent lead, and 2.47 percent zinc; in addition, 18,035 tons of old tailings were milled and averaged 2.35 ounces of silver to the ton, 0.5 percent lead, and 1.80 percent zinc. Production amounted to about 3,500 tons of lead concentrates and 1,650 tons of zinc concentrates. The Government concluded that the property was a marginal producer and that lead, its principal product, was no longer a critical metal.

Yogo district.—Some crude copper ore from the Gold Bug mine was shipped direct to the Washoe Sampling Works at Anaconda in 1943. Gold ore from the Blue Dick mine was concentrated, making copper concentrates.

LEWIS AND CLARK COUNTY

Dry Gulch district.—Several small lots of old cleanings from the Golden Messenger cyanide mill and one lot of crude siliceous ore from the Juno dump, all shipped direct to East Helena, comprised the output from the Dry Gulch district in 1943.

Heddleston district.—The Mike Horse mine, one of the chief producers of lead and zinc in Montana, was the only mine active in the Heddleston district in 1943. The Mike Horse Mining & Milling Co. operated its mine and 200-ton flotation mill throughout the year, producing more silver, lead, and copper but less gold and zinc than in 1942. A total of about 57,800 tons of zinc-lead-copper ore was treated—somewhat less than in 1942—making 4,845 tons of lead-copper concentrates and 2,056 tons of zinc concentrates. The property and mill were operated at a capacity consistent with the availability of manpower.

Helena district.—Porter Bros. operated its 6-cubic foot electrically powered Yuba dredge from January 1 to August 8, 1943, on the Last Chance Gulch placer just north of Helena. A total of 972,755 cubic yards of gravel was washed in 1943, compared with 1,455,393 in 1942, and supplied nearly all the placer output of the Helena district. Lode production came from the Peck Concentrator dump and the Crescent and Franklin D mines and was siliceous ore shipped crude to East Helena.

Marysville district.—The Montana Rainbow Mining Co., chief producer in the Marysville district, operated the Drumlummon mine throughout 1943 and shipped 2,724 tons of gold ore, containing 1,284 ounces of gold and 3,566 ounces of silver, crude to smelters. Construction of the 160-ton flotation-amalgamation mill, moved from Libby in 1942 to the Drumlummon mine, was not completed owing to the present labor and material scarcity. The Northwest Mining Co. operated the Empire mine and 35-ton Empire flotation mill until September 6, when Martin Bros. assumed control of the mill. Gold ore from the Empire mine was concentrated in the Empire mill, resulting in 179 tons of lead concentrates. In addition, 36 tons of lead ore were shipped crude to East Helena from the property. Martin Bros. treated 2,231 tons of silver ore from the Shakopee mine in the Empire mill and made 120 tons of lead concentrates; the property was active from April 16 to December 31. A lessee operated the Belmont property intermittently in 1943 and shipped 418 tons of crude gold ore to the Washoe Sampling Works at Anaconda. Among other producers active in the district in 1943 were the Tousley, Penobscot, and Nile dump.

Missouri River district.—The Perry-Schroeder Mining Co. operated its 6-cubic foot bucket dredge on the Missouri River throughout 1943 and washed 1,641,195 cubic yards of gold-bearing gravel. No platinum was reported recovered in 1943 from the operation.

Rimini district.—The South Dakota Mining Associates operated on company account and through lessees in 1943; an aggregate of 576 tons of lead ore was shipped crude to East Helena from several properties controlled by the Associates, including the Evergreen, Bunker Hill, and Free Speech mines. The Armstrong Mining Co. worked the Armstrong property on company account and through lessees; the production was lead ore shipped crude to East Helena. Other production in the district in 1943 included crude gold ore from the Aurora and lead ore from the Little Jimmy and Wisconsin mines.

Scratch Gravel district.—Production from mines in the Scratch Gravel district in 1943 comprised gold ore shipped crude to smelters from the Franklin, Nettie, Oom Paul dump, and Magpie properties.

Smelter district.—By far the most important lead and zinc producer in Montana in 1943 was the Anaconda slag-fuming plant at East Helena, owned and operated by the Anaconda Copper Mining Co. The plant was in continuous operation in 1943, except for a short period in October when operations were discontinued pending the completion of repairs and the cleaning out of flue systems at the East Helena lead smelter. The bulk of the slag fumed in 1943 was current hot slag from the East Helena lead smelter, which slag resulted from the smelting of ores, concentrates, and zinc-smelter (electrolytic) lead residues. The company treated a total of 225,261 tons of current slag and cold slag in 1943 and produced zinc-lead fume, the metals in which were valued at approximately $5,588,000. The American Smelting & Refining Co. re-treated approximately 6,800 tons of old gold-silver-copper-lead slag in 1943.

Stemple-Gould district.—Gold ore from the American Boy and Bond Holder mines comprised the production in the Stemple-Gould district in 1943.

LINCOLN COUNTY

Libby district.—Early in 1943 the Standard Silver Lead Mining Co. undertook reconditioning the Snowshoe group of properties and experimenting with the 60-ton Snowshoe flotation mill. During the year approximately 2,100 tons of zinc-lead ore and old tailings were treated, making 59 tons of lead concentrates and 29 tons of zinc concentrates.

Troy or Grouse Mountain district.—The Montana Mining & Milling Co., only company active in the Troy district in 1943, acquired a lease on the Iron Mask and Montana Morning mines and the Giant Sunrise Co. mill building. Flotation equipment capable of treating 25 tons of ore a day was installed. Actual mining operation began about July and continued until November; during this period 225 tons of zinc-lead ore was treated, resulting in 9 tons of lead concentrates and 23 tons of zinc concentrates.

MADISON COUNTY

McCarthy Mountain district.—Herman Mueller operated the B. B. & I. E. property throughout 1943 and shipped 313 tons of lead ore direct to East Helena.

Norris and Norwegian district.—Gold ore cyanided and gold ore shipped crude to smelters comprised the production from the Norris and Norwegian district in 1943. Gold ore treated in the Boaz 50-ton cyanidation-concentration mill on both company and custom account contributed virtually the entire output of the Norris district. The Boaz mine operated its property throughout 1943; however, the mill was operated until December 5 only, when it was closed owing to labor shortage and Government order. The mine will continue to ship crude siliceous gold ore to smelters. During the period of operation, the Boaz mill treated 10,730 tons of gold ore and recovered about 3,400 ounces of gold and 1,165 ounces of silver in cyanide bullion and made 435 tons of rich gold concentrates. Among other producers in the district in 1943 were the Emperor, Bayles, Pearl, and Revenue mines.

Pony district.—Virtually the entire production in the Pony district in 1943 came from the Mammoth mine operated by the Liberty Montana Mines Co. The company treated 1,620 tons of gold ore in its 120-ton flotation-gravity concentration mill, making 187 tons of copper concentrates.

Renova district.—A lessee shipped crude gold and gold-silver ore in 1943 from the Mary Ingaber group of mines direct to a smelter.

Rochester district.—John Potts, lessee, shipped a total of 705 tons of crude lead ore from the Jack Rabbit mine to the Midvale (Utah) and East Helena smelters in 1943. The Commonwealth Lead Mining Co. operated the Calvin mines from January 1 to March 5; during this period 155 tons of lead ore and 232 tons of zinc-lead ore were shipped crude to smelters in Utah and Montana. Camilla Gage, owner of the Emma mine, shipped 205 tons of zinc-lead ore to the Midvale (Utah) concentrator. Other mines in the Rochester district, active in 1943, included the Montrose, King, Thistle, and Leadora.

Sheridan district.—Victoria Mines, Inc., operated the Toledo group of properties in the Sheridan district throughout 1943. The company converted its 120-ton Victoria cyanide mill to flotation for the express purpose of treating zinc-lead ores from the Toledo mine. The mill is at Silverstar, 27 miles from the mine, and all ore is hauled to the mill by trucks. In 1943 the Toledo mine produced 581 tons of oxidized lead ore, which was shipped crude to East Helena, and 20,438 tons of zinc-lead ore, which was milled. The company was by far the largest producer of lead and zinc in the Sheridan district and one of the principal producers in Montana. Crude gold ore from the Dictator mine was shipped direct to the Washoe Sampling Works at Anaconda. A small quantity of gold ore from the Red Pine mine was concentrated in 1943, making gold concentrates. Other production in the district came from the Billy Bennett and Lost Angel mines.

Silver Star district.—The Green-Campbell Mining Co. operated its Green-Campbell mine and 25-ton amalgamation-flotation mill until July 15, 1943, when the property was shut down by Government order. The company treated about 2,500 tons of gold ore, making 142 tons of gold concentrates shipped to the Washoe Sampling Works at Anaconda and some gold bullion shipped to the Seattle Assay Office. Victoria Mines, Inc., closed its Broadway mine and cyanide mill in 1942; however, when the mill was converted from cyanidation to flotation (completed in 1943) cleanings and cyanide bullion were shipped to smelters and mints. The remainder of the district production was gold ore shipped crude to smelters, chiefly from the Stella mine.

Tidal Wave district.—Lead ore was shipped direct to East Helena in 1943 from the Inspiration, Last Chance, Keynote, and Hi-Ridge mines.

Virginia City district.—The lode output in the Virginia City district in 1943 was ore shipped crude to smelters; it included gold-silver ore from the Lone Star mine, gold ore from the Marietta mine, gold-silver and silver ore from the Alder Gulch group, and silver ore from the I. X. L. mine.

Washington district.—Crude gold ore was shipped direct to East Helena in 1943 from the Snowslide mine.

MEAGHER COUNTY

Castle Mountain district.—The Cumberland mine, reported idle since 1892, was reopened by lessees in 1943. Crude ore, which averaged about 38 percent lead and 15 ounces of silver to the ton, was shipped direct to East Helena.

MINERAL COUNTY

Packer Creek district.—The Silver Cable mine, under lease to the Hecla Mining Co. of Wallace, Idaho, was operated in 1943 from July until December 31. The property is accessible during the summer and fall months only, owing to heavy snowfall. About 10,200 tons of zinc-lead ore from the property were treated in 1943 in the Hecla mill at Burke, Idaho, making 448 tons of lead concentrates and 1,939 tons of zinc-lead concentrates; the ore averaged about 12 percent zinc and about 5 percent lead. Operations were resumed at the property in May 1944. Development was carried on continuously in 1943 on the Last Chance mine, and about 200 tons of silver ore were mined and jigged, making 19 tons of silver concentrates. A little lead ore was shipped crude to the Bunker Hill smelter from the Bryan mine.

MISSOULA COUNTY

Coloma district.—Gold ore shipped crude to a smelter from the Mammoth and I. X. L. mines and gold ore amalgamated from the Mammoth mine comprised the output of the Coloma district in 1943.

Nine Mile district.—Zinc-lead ore shipped direct to the Bunker Hill smelter (Idaho) and the Midvale (Utah) concentrator from the Kennedy Creek mine comprised the lode production from the Nine Mile district in 1943.

Wallace district.—Crude copper ore and lead ore were shipped direct to smelters from the Hidden Treasure mine in 1943.

PARK COUNTY

New World district.—The concentrating mill of the McLaren Gold Mines Co. was destroyed by fire in October 1942. At that time mining operations were suspended, and all efforts were directed toward rebuilding the mill. By June 4, 1943, the mill building had been reconstructed, damaged machinery reconditioned or replaced, and operations resumed. The new mill has a 100-ton daily capacity. During the remainder of the year 9,732 tons of gold ore were milled, making 339 tons of copper concentrates containing 101,250 pounds of copper, 2,088 ounces of silver, and 1,289 ounces of gold. In 1943, the Irma mine produced a total of 258 tons of lead ore from the mine and dump, which was shipped crude to a smelter; in addition, 500 tons of zinc-lead ore were treated in the Irma mill.

POWELL COUNTY

Big Blackfoot district.—Some gold ore was shipped direct to the East Helena smelter from the Marcum Hill mine in 1943.

Nigger Hill district.—Hopkins & Sons Mining Co. operated its Charter Oak mine and 50-ton flotation plant throughout 1943. A total of 2,208 tons of zinc-lead ore was treated, making 90 tons of lead concentrates and 31 tons of zinc concentrates; the average mill heads in 1943 contained about 0.04 ounce of gold and 3.5 ounces of silver to the ton, 3.0 percent lead, and 2.5 percent zinc. Newman Bros., operating the Lilly group, the only other producer in the district in 1943, shipped 10 tons of crude lead ore to East Helena and 41 tons of zinc-lead ore to the Midvale (Utah) concentrator.

Ophir Gulch district.—A test lot of crude copper ore was shipped direct to the Washoe Sampling Works at Anaconda from the Cyclone mine in 1943.

Zozell district.—The Hidden Hand Mining Co. operated its Hidden Hand group from January to May and shipped 69 tons of siliceous ore direct to smelters.

RAVALLI COUNTY

Curlew district.—C. A. Tout, lessee, operated the Curlew mine and its 70-ton flotation concentrator throughout 1943; 1,017 tons of gold-silver-copper-lead-zinc mill ore were treated, making 51 tons of lead-copper concentrates, 13 tons of copper concentrates, and 22 tons of zinc concentrates. The ore milled in 1943 averaged 0.06 ounce of gold and 1.30 ounces of silver to the ton, 0.74 percent copper, 1.17 percent lead, and 1.60 percent zinc. In addition, 94 tons of gold-silver ore were shipped direct to a smelter.

SANDERS COUNTY

Camas Prairie district.—Copper ore shipped direct to the Washoe Sampling Works at Anaconda in 1943 from the Glaucus mine was the only production from the Camas Prairie district.

Eagle district.—All the ore mined in 1943 from the Jack Waite mine, which extends over the county line into Idaho, was from that portion within Montana. The mine was operated throughout the year by the American Smelting & Refining Co. and produced 18,727 tons of zinc-lead ore containing 16,292 ounces of silver, 3,131,154 pounds of lead, and 764,062 pounds of zinc; the grade of the ore mined was virtually the same as in 1942. The ore was milled in the company-owned 300-ton flotation mill at Duthie, Idaho; the concen trates produced amounted to 1,902 tons of lead concentrates and 581 tons of zinc concentrates. The coarse mill ore is fed to a jaw crusher for primary breaking and then passed over a 1¼-inch vibrator screen, the oversize ore going on to a sorting belt where the high-grade ore is removed. The high-grade lead ore is shipped direct to a smelter, and the rejected portion is milled. The crude ore shipped in 1943 amounted to 218 tons and contained 1,289 ounces of silver and 335,527 pounds of lead.

SILVER BOW COUNTY

The output of all five metals from mines in Silver Bow County decreased in 1943, compared with 1942. Although the Anaconda Copper Mining Co.—only active major producer in the county in 1943—treated a greater quantity of copper material than in 1942, the average content in gold, silver, and copper was less. The increase in tonnage with decrease in content was due to the treatment of a greater proportion of mine dumps and waste tailings in 1943. The only zinc ore produced on company accounts, aside from the zinc-lead middlings product made from the treatment of manganese ore, was in the course of development or exploration in the company zinc mines. The following table gives the output of mines in Silver Bow County (which includes the Butte or Summit Valley district) in 1942 and 1943 and the total from 1882 to the end of 1943.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1942–43, and total, 1882–1943, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1942	38	4,753,741	22,381	8,123,788	280,698,000	14,411,000	58,626,000	$46,942,464
1943	28	5,163,966	16,132	6,487,380	267,137,700	6,579,400	15,754,000	42,100,656
1882–1943		(1)	1,991,324	532,388,405	[2] 6,280,598	[2] 226,232	[2] 1,547,081	2,507,150,259

[1] Figures not available.
[2] Short tons.

Butte or Summit Valley district.—The following operating details are taken in part from the Anaconda Copper Mining Co. printed annual report for the year ended December 31, 1943.

Copper production at the copper mines at Butte was maintained in 1943 at levels comparable with 1942, notwithstanding an acute manpower shortage. This shortage was relieved somewhat by the furloughing of soldiers by the United States Army and by a "miners training program" that prepared inexperienced men for underground work. Most of the planned improvements begun in 1942 were completed and aided materially in increasing production and offsetting increased costs. Facilities were installed at Anaconda for the treatment of waste production accumulated from previous operations which will add approximately 25,000,000 pounds of copper per year to production. During 1943 the aggregate tonnage of copper ore, dumps, waste tailings, and slimes treated exceeded that in 1942 by 16 percent. The copper concentrator at Anaconda treated 3,197,206 tons of copper ore from company-owned Butte mines, compared with

3,287,817 tons in 1942; and 3,582 tons of copper mine-water precipitates were treated, compared with 4,589 tons in 1942. In addition, the copper concentrator at Anaconda treated 812,513 tons of New Works sand tailings (averaging about 0.6 percent copper), compared with none in 1942; 404,359 tons of mine dumps (averaging about 0.6 percent copper), compared with 241,526 tons in 1942; 372,049 tons of Old Works tailings (averaging about 1.25 percent copper), compared with 727,464 tons in 1942; and 88,314 tons of special waste, compared with none in 1942. Crude ore from the Butte mines amounted to 79,613 tons; Old Works tailings, Butte and Boston slime, and New Works tailings totaled 44,689 tons.

A slime-disintegrating plant about 2½ miles east of Anaconda was built in 1943. The plant has a 1,500-ton daily capacity and is to treat the slime deposits east of Anaconda. Briefly, the treatment process is as follows: Slime is excavated from the ponds by dragline, carried by trucks to the "wash mills," and water is added. The "wash mills" are concrete tanks, with vertical shafts, and arms dragging harrows. The slime is converted into pulp, and the pulp is screened and pumped into two Hardinge mills, where sand contained in the pulp is ground to flotation size. The pulp is then treated in flotation machines for recovery of copper sulfide; the concentrate is dewatered and taken by conveyor belt to the smelter. During 1943 the plant treated 13,816 tons of slimes that averaged over 2 percent copper; flotation copper concentrate and table iron concentrates were made.

The North Butte Mining Co. property was operated throughout 1943 by the Anaconda Copper Mining Co. under contract agreement. The output from the property in 1943 amounted to 100,368 tons of copper mill ore and 176 tons of copper mine-water precipitates. Incidental to exploration and development in the zinc mines, a total of 10,854 tons of zinc-lead ore was removed. Development at all company copper mines comprised 241,197 feet of drifts, 535 feet of shafts, and 5,790 feet of diamond drilling; and at all zinc mines 7,624 feet of drifts and 1,888 feet of diamond drilling. The Anaconda Copper Mining Co. operated the Emma mine throughout 1943 under lease from the Butte Copper & Zinc Co. Production amounted to 25,962 tons of zinc-lead middlings (from the treatment of manganese ore); in addition, 1,696 tons of zinc-lead middlings were produced as a byproduct of the milling of manganese ore from the Orphan Girl and Travona mines; all were treated in the Anaconda zinc concentrator. Development comprised 23,095 feet of drifts and 857 feet of diamond drilling on the Emma mine and 7,426 feet of drifts and 924 feet of diamond drilling on company-owned manganese mines.

Lessees of the Anaconda Copper Mining Co. operated several company properties; the most productive were the Poulin, which yielded zinc-lead ore containing about 2,600,000 pounds of zinc and 700,000 pounds of lead; and the Black Rock group, which yielded 1,442 tons of silver ore and 102 tons of zinc ore. Lessee operations were smaller in 1943 than in 1942.

Highland district.—A lessee shipped 229 tons of gold ore direct to smelters from the Butte Highlands property in 1943.

Melrose district.—A car of silver ore from the Lincoln mine was shipped direct to the Washoe Sampling Works at Anaconda in 1943.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEVADA

(MINE REPORT)

By Charles White Merrill

SUMMARY OUTLINE

	Page		Page
Summary	408	Mining industry	412
Calculation of value of metal production	408	Ore classification	413
Mine production by counties	412	Metallurgic industry	413
		Review by counties and districts	416

SUMMARY

The total value of gold, silver, copper, lead, and zinc recovered from ore, old tailings, and gravels in Nevada decreased 21 percent in 1943 compared with 1942; all five metals except zinc decreased in both quantity and value. The value of the zinc output was the largest since 1916. Higher wages, enlistment of miners in the armed forces, migration of miners to war industries and military construction jobs, rising prices of supplies and equipment and difficulties in obtaining them, increased taxes, and fixed prices for gold and silver were factors in reducing the total output, despite Nevada's great mineral resources and the war demand on many of them. The continued enforcement of War Production Board Order L–208 of October 8, 1942, was also a factor in the lowered output of gold mines. During 1943, however, seven grants permitting expanded production were authorized to Nevada operators by the War Production Board.

Comparing 1943 with 1942, gold output decreased 51 percent and silver 56 percent in both quantity and value; copper decreased 15 percent in quantity and 9 percent in value; lead decreased 11 percent in quantity and less than 1 percent in value; and zinc increased 34 percent in quantity and 55 percent in value. Of the total value of the five metals copper comprised 65 percent, gold 18, zinc 10, silver 4, and lead 3 percent.

White Pine County increased its lead over the other counties and produced 68 percent of the State total value of the five metals; it stood first in output of copper and of gold. Lincoln County produced 13 percent of the State total value and ranked second to White Pine County; it led in the State in zinc, silver, and lead output.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.
[4] $0.67878787.
[5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1939–43, and total, 1859–1943, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	891	104	6, 894, 999	361, 518	$12, 653, 130	4, 316, 029	$2, 929, 668
1940	895	115	8, 338, 259	383, 933	13, 437, 655	5, 175, 928	3, 680, 660
1941	799	78	8, 799, 635	366, 403	12, 824, 105	5, 830, 238	4, 145, 947
1942	434	49	9, 383, 379	295, 112	10, 328, 920	3, 723, 435	2, 647, 776
1943	168	17	8, 364, 043	144, 442	5, 055, 470	1, 620, 280	1, 152, 199
1859–1943 [2]			([3])	25, 215, 000	561, 086, 676	586, 050, 045	538, 078, 376

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1939	133, 194, 000	$13, 852, 176	8, 472, 000	$398, 184	12, 456, 000	$647, 712	$30, 480, 870
1940	156, 908, 000	17, 730, 604	14, 998, 000	749, 900	23, 666, 000	1, 490, 958	37, 089, 777

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Compiled by Chas. W. Henderson, chief, Western Offices Section, Metal Economics Division, Denver, Colo. From 1904 (when first satisfactory annual canvass of mine production was made) to 1943, inclusive, the output was as follows: Gold, 13,388,123.51 ounces valued at $316,603,443; silver, 297,637,196 ounces, $200,920,153; copper, 1,618,299 short tons, $458,572,020; lead, 289,334 tons, $33,910 705; zinc, 282,683 tons, $40,307,678; total value, $1,050,313,999.
[3] Figures not available.
[4] Short tons.

Gold.—Gold production in Nevada in 1943 was the lowest in quantity and value since 1934. Although the recession in gold began after the large output of 1940, monthly production did not assume a marked downward trend until August 1942. By February 1943 a much lower level had been established, which persisted with minor fluctuations throughout the remainder of the year. This period of sharp decline included the weeks when War Production Board Limitation Order L–208, promulgated October 8, 1942, was taking effect.

The 10 leading gold-producing mines in 1943 supplied 93 percent of Nevada's output, and the 3 leaders contributed 69 percent. The importance of base-metal mines where gold is a byproduct is significant; 1943 was the first year in the history of the State when more gold was derived from base-metal ores than from dry ores.

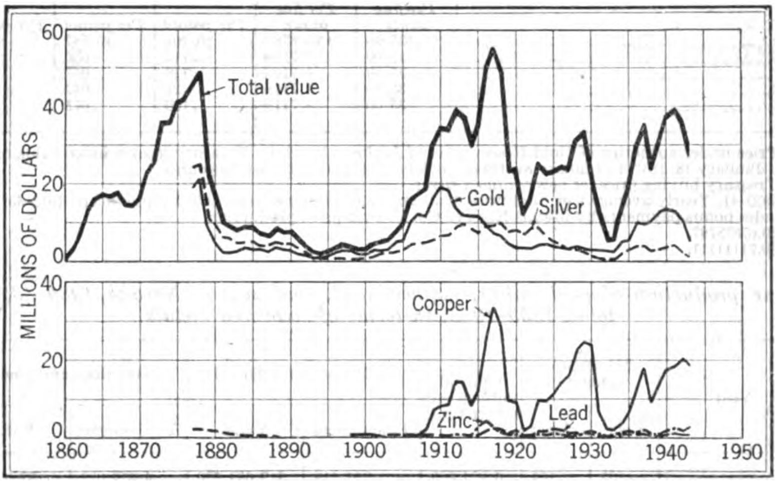

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada, 1860–1943.

Ten leading gold-producing mines in Nevada in 1943, in order of output

Rank	Mine	District	County	Rank in 1942	Operator	Source of gold
1	Ruth and Copper Flat Pit.	Robinson	White Pine	2	Kennecott Copper Corporation (Nevada Mines Division).	Copper ore.
2	Getchell	Potosi	Humboldt	1	Getchell Mine, Inc	Gold ore.

6	Goldacres	Bullion	do	6	Willow Creek Mines, Inc.	Gold ore.
7	Crown Point and Yellow Jacket.	Comstock	Storey	13	Sutro Tunnel Coalition, Inc.	Gold-silver ore.
8	Overman	do	do	7	Consolidated Chollar Gould & Savage Mining Co.	Gold ore and old tailings.
9	Mary	Silver Peak	Esmeralda	11	Fred Vollmar and Carson Frazzini.	Gold ore.
10	Mizpah	Tonopah	Nye	18	Various lessees	Gold-silver ore

Silver.—The 10 leading silver-producing mines in Nevada in 1943, listed in the following table, produced 79 percent of the State total recoverable silver; the first 2 yielded over one-fourth of the total. As in preceding years, most of the silver was a byproduct of ore mined chiefly for other metals; only 21 percent of it was derived from straight silver ore. The Nivloc mine, the State's leading silver mine from 1938 to 1942, dropped to second place in 1943; production was suspended during the year, and mine and mill equipment was sold.

Ten leading silver-producing mines in Nevada in 1943, in order of output

Rank	Mine	District	County	Rank in 1942	Operator	Source of silver
1	Pioche Nos. 1 and 2 group.	Pioche	Lincoln	4	Combined Metals Reduction Co.	Zinc ore and gold-silver old tailings.
2	Nivloc	Silver Peak	Esmeralda	1	Desert Silver, Inc.	Silver ore.
3	Ruth and Copper Flat Pit.	Robinson	White Pine	8	Kennecott Copper Corporation (Nevada Mines Division).	Copper ore.
4	Mizpah	Tonopah	Nye	2	Various lessees	Gold-silver ore.
5	Bristol Silver	Jack Rabbit	Lincoln	3	Bristol Silver Mines Co.	Silver ore.
6	Crown Point and Yellow Jacket.	Comstock	Storey	11	Sutro Tunnel Coalition, Inc.	Gold-silver ore
7	Copper Canyon	Battle Mountain.	Lander	17	International Smelting & Refining Co.	Copper ore.
8	Financier	Pioche	Lincoln	6	Salt Lake-Pioche Mining Co.	Lead ore.
9	Rip Van Winkle	Merrimac	Elko	5	Rip Van Winkle Consolidated Mining Co.	Do.
10	Prince	Pioche	Lincoln	14	Prince Consolidated Mining Co.	Lead ore and zinc ore.

Copper.—Over 97 percent of the recoverable copper output of Nevada in 1943 came from mines operated by the following companies: The Kennecott Copper Corporation (Nevada Mines Division), working the Ruth mine at Ruth and the open pit at Copper Flat (both in the Robinson district, White Pine County); the Consolidated Coppermines Corporation, working the Coppermines group at Kimberly (also in the Robinson district); and the Mountain City Copper Co., working the Mountain City mine at Mountain City (in the Cope district, Elko County). Late in 1943 the Consolidated Coppermines Corporation began production from a newly opened open pit at Kimberly, which it named Tonopah Pit.

Lead.—Over 61 percent of the lead produced in Nevada in 1943 was mined in the Pioche district, Lincoln County, where the leading properties were: The Pioche Nos. 1 and 2 group operated by the Combined Metals Reduction Co., the Financier mine operated by the Salt Lake-Pioche Mining Co. and lessees, and the Prince mine operated by the Prince Consolidated Mining Co. Other important producers in the State were: The Bristol Silver Mines Co. Bristol Silver mine (in the Jack Rabbit district, Lincoln County) and the Rip Van Winkle Consolidated Mining Co. Rip Van Winkle mine (in the Merrimac district, Elko County).

Zinc.—As in recent years, zinc production in Nevada was centered in the Pioche district, Lincoln County, where 88 percent of the State total in 1943 was mined. The Combined Metals Reduction Co., Prince Consolidated Mining Co., and Ely Valley mine were the principal producers. The addition of a slag-fuming plant for recovering zinc from lead blast-furnace slag and from oxidized zinc ore at the Tooele (Utah) plant of the International Smelting & Refining Co. has offered a new market to some Nevada miners.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Nevada in 1943, by counties, in terms of recovered metals

County	Mines producing [1]		Gold						Silver (lode and placer)

MINING INDUSTRY

The 11-percent decline in total tonnage of ore and old tailings sold or treated in Nevada in 1943, compared with 1942, resulted principally from suspension of operations at mines where dry and siliceous ore was produced. In addition, there was a small recession in production of copper ore due mainly to chronic labor shortage throughout the State.

The connected-bucket dredge of the Manhattan Gold Dredging Co. in the Manhattan district, Nye County, was again the largest producer of placer gold and again the fourth-largest of total gold in the State. Except for this operation, Nevada placer mines were virtually quiescent.

ORE CLASSIFICATION

The following table classifying ores produced in Nevada in 1943 shows that 92 percent of the tonnage (including old tailings) sold or treated was copper ore, 5 percent gold ore and old tailings, 2 percent zinc ore, and the remainder gold-silver ore and old tailings, silver ore, lead ore and old tailings, and zinc-lead ore.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Nevada in 1943, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead	Zinc

[1] Includes 8,865,300 pounds of copper from precipitates.
[2] Includes 6,172,600 pounds of copper from precipitates.

METALLURGIC INDUSTRY

Of the 8,364,043 tons of lode material from Nevada mines sold or treated during 1943, 93 percent went to concentrating mills, 5 percent to amalgamation and cyanidation mills, and 2 percent to smelters; of this material, 0.32 percent was old tailings—all amalgamated, cyanided, or smelted. Flotation was employed at concentration mills to the virtual exclusion of gravity concentration. Of the gold recovered as bullion, cyanidation supplied 96 percent and amalgamation 4 percent; of the silver recovered as bullion, 99.5 percent was derived by cyanidation and 0.5 percent by amalgamation. The tonnage of crude ore and old tailings shipped to smelters increased 1 percent in 1943 compared with 1942.

The 175-ton all-slime cyanide mill at the Nivloc mine, Silver Peak district, Esmeralda County, was dismantled during 1943.

The 500-ton selective-flotation mill, operated by the Combined Metals Reduction Co. at Pioche, Lincoln County, treated zinc-lead and zinc ores upon a custom basis for several neighboring mines and also milled company zinc-lead ore. The Kennecott Copper Corporation treated all the copper ore produced by the Consolidated Coppermines Corporation upon a contract basis, in addition to milling its own ore. The Kennecott Copper Corporation also operated the McGill copper smelter, which was Nevada's only smelter and the most important privately financed metallurgical plant in the State.

Mine production of metals in Nevada in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc

---

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 6 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 1,615,846 ounces from lode mines and 4,434 ounces from placers.

[4] Output from property not classed as a "mine."

[5] Includes 8,865,300 pounds of copper from precipitates.

[6] Includes following districts: Cope and Dolly Varden in Elko County; Round Mountain in Nye County; Sierra and Staggs in Pershing County; and Galena in Washoe County.

CLARK COUNTY

Eldorado Canyon district.—W. W. Hartman operated the Wall Street mine from January 1 to June 18, 1943; 7,764 tons of gold-silver ore treated in the company 60-ton flotation mill yielded 82 tons of gold-silver concentrates (containing 628 ounces of gold and 10,828 ounces of silver), which were shipped to a smelter.

Searchlight district.—A lessee shipped 37 tons of ore, containing 110 ounces of gold and 1,077 ounces of silver, produced at the Blossom mine during 1943.

Yellow Pine (Goodsprings) district.—The Root Zinc Mining Co. worked the Root Zinc mine throughout 1943; 115 tons of zinc-lead ore shipped to a smelter contained 22,469 pounds of lead and 74,906 pounds of zinc. In addition, the company shipped a larger tonnage of ore to the Metals Reserve Co. stock pile at Jean. H. C. Kennedy worked the Whale mine during 1943; 20 tons of lead ore shipped to a smelter contained 104 ounces of silver and 17,824 pounds of lead. In addition, 69 tons of ore containing 43,760 pounds of zinc were shipped to the Metals Reserve Co. stock pile at Jean.

ELKO COUNTY

Contact (Salmon River) district.—The Marshall Mining Co. operated the Delano and Allen mines as a unit throughout 1943; 1,181 tons of copper ore containing 15 ounces of gold, 1,642 ounces of silver, and 107,762 pounds of copper were shipped to a smelter.

Cope (Mountain City) district.—The Mountain City Copper Co. (third-largest copper producer in Nevada) was active throughout 1943; part of the ore was treated in the company 400-ton flotation mill, and high-grade copper ore was shipped for direct smelting.

Dolly Varden district.—The International Smelting & Refining Co. carried on development at the Victoria mine throughout 1943, and the copper ore produced was shipped to a smelter. Much of the work was done by Negro miners released from the Army for jobs in western metal mines; as far as is known this represents the first employment of Negroes underground in the State of Nevada.

Merrimac district.—The Rip Van Winkle Consolidated Mining Co. worked the Rip Van Winkle mine throughout 1943; 5,530 tons of lead ore treated in the company 100-ton flotation mill yielded 455 tons of lead concentrate (containing 9 ounces of gold, 72,115 ounces of silver, 6,728 pounds of copper, 647,062 pounds of lead, and 21,110 pounds of zinc) and 450 tons of zinc concentrate (containing 2 ounces of gold, 2,038 ounces of silver, 4,768 pounds of copper, 9,951 pounds of lead, and 440,790 pounds of zinc).

Ruby Valley district.—The Nevada Mining & Development Co. operated the Michigan mine from September 1 to December 17, 1943, and shipped 861 tons of zinc ore for treatment by concentration and smelting; 139 ounces of silver, 18,800 pounds of lead, and 104,700 pounds of zinc were recovered.

Warm Creek (Clover Valley) district.—T. E. Wood operated the Polar Star mine from May 1 to July 30, 1943, and shipped 105 tons of zinc ore containing 44,038 pounds of zinc for treatment by fuming.

ESMERALDA COUNTY

Divide district.—Lessees operating the Divide mine shipped 531 tons of ore, containing 379 ounces of gold and 1,371 ounces of silver, during 1943.

Goldfield district.—The Goldfield Consolidated Mines Co. worked the Goldfield Consolidated mine throughout 1943; 139 tons of ore shipped to a smelter contained 113 ounces of gold, 283 ounces of silver, 1,765 pounds of copper, and 7,384 pounds of lead.

Silver Peak district.—Desert Silver, Inc., operator of the Nivloc mine—largest producer of silver in Nevada from 1938 to 1942 and second-largest in 1943—suspended operations on July 31, 1943. The cyanidation of 20,983 tons of ore yielded 903 ounces of gold and 207,523 ounces of silver. Soon after operations were suspended, machinery at the mine was sold at auction; it was being removed at the end of the year.

EUREKA COUNTY

Cortez district.—M. and K. Elquist operated the Ventura mine from January 1 to August 31, 1943, and shipped 79 tons of ore containing 84 ounces of gold and 48 ounces of silver to a smelter.

Eureka district.—Lessees worked the Colorado mine during 1943; 48 tons of ore shipped to a smelter contained 104 ounces of gold and 207 ounces of silver. Cardinalli & Frank worked the Mountain View mine from August 28 to December 31; 204 tons of zinc ore containing 23 ounces of silver, 14,315 pounds of lead, and 114,622 pounds of zinc were shipped to a smelter.

HUMBOLDT COUNTY

Potosi district.—Getchell Mine, Inc., treated gold ore from the Getchell mine in a 1,000-ton cyanide plant. The arsenic content of the ore, which had required the installation of expensive roasting equipment, proved most welcome when War Production Board Order L-208 went into effect, because this property was permitted to continue operations as a producer of strategic arsenic.

LANDER COUNTY

Battle Mountain district.—The International Smelting & Refining Co. operated its 350-ton flotation mill at the Copper Canyon mine throughout 1943. In addition to copper concentrates, crude copper ore was shipped to a smelter. Lessees worked the Copper Queen mine from August 15 to December 31; 570 tons of copper ore containing 4 ounces of gold, 108 ounces of silver, and 51,537 pounds of copper were shipped to a smelter. Broyles & Wilson worked the Independence group from March 9 to November 13; 266 tons of ore shipped to a smelter contained 137 ounces of gold and 4,682 ounces of silver. Symanzik & Wrobel worked the Trinity mine throughout the year; 647 tons of silver ore (containing 62 ounces of gold, 11,565 ounces of silver, 1,229 pounds of copper, and 53,000 pounds of lead) and 114 tons of lead ore (containing 14 ounces of gold, 3,874 ounces of silver, 480 pounds of copper, and 15,734 pounds of lead) were shipped to a smelter.

Bullion district.—Willow Creek Mines, Inc., worked the Goldacres mine throughout 1943. Ore mined by open-pit methods was treated in the company 300-ton cyanidation mill. Gold ore was shipped to a smelter from the Gold Quartz mine during the year.

Hilltop district.—Govich & Wikberg shipped 16 tons of ore containing 106 ounces of gold, 187 ounces of silver, 129 pounds of copper, and 257 pounds of lead from the Pittsburgh Red Top mine to a smelter during 1943.

New Pass district.—Smith & Snyder amalgamated 100 tons of ore from the Thomas W. mine and recovered bullion containing 45 ounces of gold and 7 ounces of silver.

LINCOLN COUNTY

Groom district.—The International Mining Corporation and Dan Sheahan worked the Groom mine from January 1 to September 30, 1943; 1,367 tons of lead ore treated in the company 50-ton flotation mill yielded 142 tons of lead concentrates containing 2,056 ounces of silver and 152,577 pounds of lead. In addition, 193 tons of ore containing 772 ounces of silver and 59,335 pounds of lead were shipped for direct smelting.

Jack Rabbit district.—The Bristol Silver Mines Co., largest shipper of direct-smelting ore in the State, shipped silver ore containing substantial quantities of base metals from the Bristol Silver mine during 1943.

Pioche district.—The Combined Metals Reduction Co. operated its 500-ton flotation mill on company and custom ore throughout 1943. Company ore was derived from the Abe Lincoln, Amalgamated Pioche, Pioche 802, and Raymond Ely West mines. The mill products were lead concentrate and zinc concentrate, which were shipped for further treatment. In addition to operations by the Combined Metals Reduction Co., the Amalgamated Pioche Mining & Smelting Corporation shipped lead tailings to a smelter from the Amalgamated Pioche mine. The Salt Lake-Pioche Mining Co. worked the Apex and Financier mines, both on company account and through lessees; 428 tons of lead ore (containing 60 ounces of gold, 39,813 ounces of silver, 246 pounds of copper, and 134,069 pounds of lead) were shipped to a smelter from the Apex mine, and 2,776 tons of lead ore (containing 228 ounces of gold, 82,396 ounces of silver, 1,646 pounds of copper, and 838,296 pounds of lead) were shipped to a smelter from the Financier mine. Ely Valley Mine operated the Ely Valley mine throughout 1943 and shipped zinc ore to the Pioche mill of the Combined Metals Reduction Co. The Prince Consolidated Mining Co., which operated the Prince mine, also shipped zinc ore to the Pioche mill of the Combined Metals Reduction Co. In addition, lead ore was shipped for direct smelting.

LYON COUNTY

Yerington district.—During 1943 lessees working the Mason Valley mine shipped to a smelter 1,500 tons of copper ore containing 7 ounces of gold, 271 ounces of silver, and 187,010 pounds of copper. The International Smelting & Refining Co. carried on an extensive exploration and development campaign at the Gelder property during the year; no production was reported.

NYE COUNTY

Manhattan district.—E. J. Hyde worked the Big Four mine during 1943; 60 tons of ore treated by amalgamation yielded 67 ounces of gold and 31 ounces of silver. The Owl Fraction was worked during the year, and 6 tons of ore treated by amalgamation yielded 42 ounces of gold and 15 ounces of silver. John Farrell treated 30 tons of ore mined from the Red Horse mine and recovered 50 ounces of gold and 14 ounces of silver; placer operations at this mine resulted in the recovery of 95 ounces of gold and 42 ounces of silver from the treatment of 450 cubic yards of gravel. The Manhattan Gold Dredging Co. was permitted by the War Production Board to operate from March 27 to December 31. The dredge was equipped with 108 9½-cubic foot buckets.

Quartz Mountain district.—Obie LeFavor worked the San Rafael mine during 1943 and shipped to a smelter 269 tons of lead ore containing 25 ounces of gold, 3,510 ounces of silver, 2,320 pounds of copper, and 61,020 pounds of lead.

Tonopah district.—Several sets of lessees worked parts of the Tonopah Mining Co. of Nevada property throughout 1943 and shipped gold-silver ore to a smelter.

Tybo district.—Hall Bros. Co., Inc., worked the 2–G mine throughout 1943 and shipped ore and old tailings for treatment by concentration and smelting; 537 tons of zinc-lead ore containing 62 ounces of gold, 9,439 ounces of silver, 157 pounds of copper, 100,825 pounds of lead, and 83,767 pounds of zinc were treated at a custom concentration plant; in addition, 2,760 tons of lead ore and 120 tons of lead old tailings smelted contained 251 ounces of gold, 39,520 ounces of silver, 750 pounds of copper, and 450,540 pounds of lead.

PERSHING COUNTY

Antelope district.—Greenan-Kerr Tin Mine carried on a development campaign for copper and tin at the Majuba Hill mine in 1943 from January 1 until June, after which operations were largely confined to stoping copper ore; 7,302 tons of ore containing 70 ounces of gold, 11,080 ounces of silver, and 641,139 pounds of copper were shipped to a smelter. In addition, a small quantity of tin ore was shipped to a concentrator at Toy, Nev., and the concentrates were forwarded to the Longhorn smelter, Texas City, Tex.

STOREY COUNTY

Comstock district.—The Consolidated Virginia Mining Co. carried on an open-pit operation on the Comstock Lode outcrop during May and June 1943 and treated 5,000 tons of ore in a 100-ton flotation mill; 129 tons of gold concentrates containing 265 ounces of gold and 3,373 ounces of silver were shipped to a smelter. The Sutro Tunnel Coalition, Inc., worked the Crown Point and Yellow Jacket mines. The Consolidated Chollar Gould & Savage Mining Co. worked the Overman mine from January 1 to May 1 and from August 1 to December 31; 37,769 tons of ore and 22,572 tons of old tailings treated in the company 400-ton cyanidation mill yielded 2,139 ounces of gold and 28,733 ounces of silver.

WASHOE COUNTY

White Horse district.—The owner and lessees worked the Lode No. 2 mine during 1943 and recovered 119 ounces of gold and 50 ounces of silver from the amalgamation of 21 tons of ore.

WHITE PINE COUNTY

Aurum (*Silver Mountain*) *district.*—The Grand Deposit Mining Co., which had started a development program at the Grand Deposit mine in October 1942, began stoping operations on March 20, 1943. Several classes of ore were produced—292 tons of copper ore contained 3 ounces of gold, 2,160 ounces of silver, 31,475 pounds of copper, and 6,652 pounds of lead; 11 tons of lead ore contained 66 ounces of silver, 223 pounds of copper, and 2,381 pounds of lead; and 1,492 tons of zinc ore contained 9,952 pounds of copper, 22,035 pounds of lead, and 724,376 pounds of zinc.

Robinson district.—The Nevada Consolidated Copper Corporation, which had been the operating subsidiary of the Kennecott Copper Corporation in Nevada for many years, merged with the parent corporation and became known as the Kennecott Copper Corporation, Nevada Mines Division, as of January 1, 1943. This corporation, which operated the Ruth mine at Ruth and the open pit at Copper Flat, as well as the McGill flotation concentrator (daily capacity, 20,000 tons) and the McGill copper smelter, both at McGill, was the largest privately financed industrial organization in Nevada. In addition to being the leading copper producer in the State, the corporation stood first in gold and third in silver output. With the virtual disappearance of shipments of siliceous ore by small producers in White Pine County to the McGill smelter, the company provided silica for its smelter charges by mining oxidized (carbonate) ore which it smelted without concentration. The Consolidated Coppermines Corporation, second-largest copper and third-largest gold producer in the State in 1943, was active throughout the year; copper ore mined on company account was shipped to the McGill concentrator, and small quantities of lead ore and zinc ore were shipped for direct smelting. Late in the year the company began production from a new open pit, known as the Tonopah, under an arrangement with the Metals Reserve Co., which provided for payment above the ceiling price for the copper produced from this very low grade ore.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEW MEXICO

(MINE REPORT)

By Chas. W. Henderson and R. H. Mote

SUMMARY OUTLINE

	Page		Page
Summary	426	Mining industry	431
Calculation of value of metal production	427	Ore classification	431
Mine production by counties	430	Metallurgic industry	442
		Review by counties and districts	435

SUMMARY

Production of zinc in New Mexico in 1943 was larger in quantity than in any previous year, of lead greater than in any year since 1937, and of copper greater than in any year but record-making 1942. The output of gold decreased 53 percent and silver 31 percent in both quantity and value. The production of gold is the smallest on record since 1876 and of silver the smallest since 1926. The total value of the recovered output of the five metals was $34,042,378 in 1943 compared with $29,542,885 in 1942. Copper represented 58 percent and zinc 38 percent of the total value in 1943.

The Metals Reserve Co. continued its premium-price plan for overquota production of domestic copper, lead, and zinc in 1943. This Government subsidy of metal mining, initiated on February 1, 1942, is to be effective until July 31, 1945; however, the Metals Reserve Co. reserves the right to terminate the program if the national emergency ends before July 31, 1945.

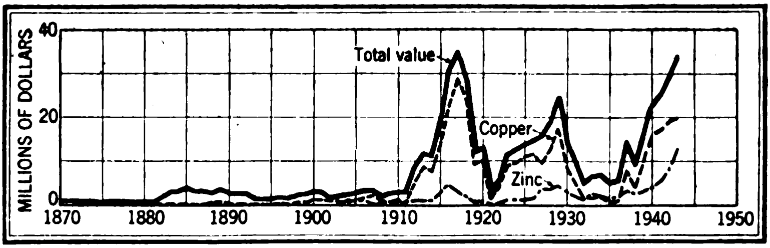

Figure 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1943. The value of gold, silver, and lead produced annually has been relatively small.

Early in 1943 the Metals Reserve Co. announced a revised scale of premium payments and established three premium-price classes for zinc, designated A, B, and C. Lead was also included in this set-up because of the close affinity of lead and zinc in ore bodies, but no action was announced for copper. Lead received only one additional premium on the B level of 2¾ cents a pound above the 6½ cents a pound ceiling price and 2¾ cents a pound premium offered throughout most of 1942. Zinc received two additional premiums of 2¾ cents each for B and C classes above the 8¼ cents a pound ceiling price and the 2¾ cents a pound A premium offered in 1942. Whether a property was eligible for all or only part of these premiums was left to the judgment of the quota committee. Effective August 1, 1943, the Metals Reserve Co. announced a new program designed to speed payments to mine operators having zero quotas, wherein such operators were permitted to obtain an advance of 90 percent of their premium allowance at the time ceiling-price settlement was made on individual shipments to the mill, smelter, or processing plant. Circumstances late in 1943 caused a sudden about-face in the Government attitude toward subsidy of the base-metal mines. These circumstances were: Increasing mineral production, greatly revised military requirements, and greater need for manpower than for large stock piles of metals of no immediate use. Accordingly, the War Production Board announced on October 27 that no new B and C premiums would be issued to zinc mines (B premiums were already denied to lead mines not in operation). Copper mines which produced less than 2,000 tons of ore during 1942 and required increased revenue to obtain maximum production were aided by a Reconstruction Finance Corporation plan, announced on May 3, 1943. No specific premium above the existing 5 cents per pound was stated. The mines were given individual consideration as to the premium necessary to insure continuous operation and maximum production.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1939 to 1943, as well as the total production from 1848 to 1943. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records year by year may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1939–43, and total, 1848–1943, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	214	168	4,977,375	36,979	$1,294,265	1,400,878	$950,899
1940	164	179	7,089,903	35,943	1,258,005	1,407,839	1,001,130

[2] Short tons.

Gold and silver produced at placer mines in New Mexico, 1939–43, in terms of recovered metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1939	3,474	$121,590	209	$142	$121,732	1942	1,247	$43,645	135	$96	$43,741
1940	2,928	102,480	263	187	102,667	1943	92	3,220	25	18	3,238
1941	2,488	87,080	284	202	87,282						

Gold.—Mine production of recovered gold in New Mexico decreased from 11,961 fine ounces in 1942 to 5,563 ounces in 1943, the smallest production on record since 1876. The principal gold-producing districts in 1943 were: Central, Grant County, which contributed 49 percent of the State production of recovered gold; Lordsburg, Hidalgo County, 26 percent; Mogollon, Catron County, 13 percent; Steeple Rock, Grant County, 4 percent; Magdalena, Socorro County, 3 percent; and Pinos Altos, Grant County, 2 percent. Copper ore yielded 37 percent of the State total gold; dry and siliceous ores, 29 percent; zinc ore, 17 percent; lead and zinc-lead ores, 15 percent; and placers, 2 percent.

Silver.—Mine production of recovered silver in New Mexico was 463,583 fine ounces in 1943 compared with 676,170 ounces in 1942. The Central district contributed 39 percent of the State total in 1943; Lordsburg, 18 percent; Magdalena, 14 percent; Mogollon, 10 percent; Steeple Rock, 5 percent; Pinos Altos, 4 percent; San Simon, 3 percent; Kingston, 3 percent; Swartz, 1 percent; and Burro Mountain, 1 percent. Zinc-lead ore yielded 50 percent of the total silver; copper ore, 22 percent; zinc ore, 14 percent; dry and siliceous ores, 13 percent; and lead and lead-copper ores and a small amount of silver from placer operations, 1 percent.

Copper.—The mine production of recovered copper in New Mexico in 1943 was 152,326,000 pounds, a 5-percent decrease from the record annual production of 1942. The Chino open-pit mine of the Kennecott Copper Corporation at Santa Rita, Grant County, continued to be by far the largest copper producer in the State; the second-largest continued to be the Banner Mining Co., operating the Bonney mine 6 miles south of Lordsburg; and other substantial producers were the Burro Mountain group of the Phelps Dodge Corporation at Tyrone, Grant County, and the Stauber and Pastura mines near Pastura, Guadalupe County. Copper ore and mine-water precipitates yielded 99 percent of the total copper; virtually all the remainder was recovered from concentrates produced by milling zinc and zinc-lead ores.

Lead.—The production of recovered lead in New Mexico increased 24 percent in quantity in 1943 over 1942. Substantial gains in the Central district, Grant County, and the Magdalena district, Socorro County, brought about the increase. Nearly 50 percent of the total State output of lead came from the American Smelting & Refining Co. Ground Hog mine in the Central district, Grant County. Zinc-lead and zinc ores yielded nearly 97 percent of the total lead, copper and dry and siliceous ores nearly 2 percent, and lead and lead-copper ores nearly 2 percent.

Zinc.—The production of recovered zinc from mines in New Mexico increased 28 percent in 1943, following a 23-percent increase in 1942. Largely responsible for the increase in 1943 was the opening in March 1943 in the Central district, Grant County, of the United States Smelting, Refining & Mining Co. Bullfrog mine and 400-ton selective-flotation mill. The principal producers in 1943 were the Peru Mining Co. (Copper Flat, Kearny, and Pewabic mines), Empire Zinc Co. (Hanover mine group), United States Smelting, Refining & Mining Co. (Bullfrog mine), and American Smelting & Refining Co. (Ground Hog Unit), all in the Central district, Grant County; and the American Smelting & Refining Co. (Waldo mine) and Empire Zinc Co. (Kelly Unit), both in the Magdalena district, Socorro County. Other major zinc-producing districts were the Pinos Altos, Swartz, Steeple Rock, and Burro Mountain, in Grant County; Organ, in Dona Ana County; and Kingston, in Sierra County.

Zinc concentrates produced in 1943 amounted to 127,748 tons containing, as shipped, 1,357 ounces of gold, 158,414 ounces of silver, 1,123,453 pounds of copper, 3,808,435 pounds of lead, and 137,201,445 pounds of zinc. The average zinc content was therefore 53.70 percent.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

MINING INDUSTRY

The major elements affecting the mining industry of New Mexico in 1943 continued to be a persistent shortage of experienced mine and mill labor, marked absenteeism, and the gold-mine closing order issued by the Government in October 1942. Although the shortage of labor was more or less constant throughout the year, the Army alleviated the situation somewhat by releasing 4,500 men in the Ninth Service Command for work in copper, zinc, and molybdenum mines; this program began August 12, 1943, and approximately 1,000 men were released each week thereafter until the full quota had been exhausted. New Mexico received 164 of the total 4,500. Absenteeism retarded production at all the large mines, most notably affecting production immediately following pay days. The decreased production of gold and silver in 1943 reflects the effect of the War Production Board Gold Mining Limitation Order of October 1942 on this branch of the metal-mining industry of New Mexico.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in New Mexico in 1943, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	200	882	226	116	1,583	
Dry and siliceous gold-silver ore	904	716	47,380	6,470		
Dry and siliceous silver ore	1,812	35	14,013	6,281	13,422	
	2,916	1,633	61,619	12,867	15,005	
Copper ore	7,571,937	2,058	100,503	[1] 150,733,066	187,158	
Lead ore	586	117	5,054	5,594	188,513	
Lead-copper ore	60		174	3,379	6,660	
Zinc ore	361,391	934	64,154	348,085	1,535,071	58,326,197
Zinc-lead ore	392,153	729	232,054	1,223,009	9,513,593	60,721,803
	8,326,127	3,838	401,939	[1] 152,313,133	11,430,995	119,048,000
Total, lode mines	8,329,043	5,471	463,558	[1] 152,326,000	11,446,000	119,048,000
Total, placers		92	25			
	8,329,043	5,563	463,583	[1] 152,326,000	11,446,000	119,048,000
Total, 1942	8,221,512	11,961	676,170	[2] 160,200,000	9,216,000	92,922,000

[1] Includes 27,744,537 pounds of copper recovered from precipitates from mine water and leached dumps.
[2] Includes 26,042,745 pounds of copper recovered from precipitates from mine water and leached dumps.

METALLURGIC INDUSTRY

The quantity of ore sold or treated in New Mexico in 1943 totaled 8,329,043 tons—largest in any year on record and 107,531 tons higher than the record of 1942. Copper ore sold or treated decreased from 7,631,752 tons in 1942 to 7,571,937 tons in 1943; zinc-lead ore increased from 220,378 to 392,153, most of the increase coming from Grant County; dry and siliceous ores decreased from 37,831 to 2,916; zinc ore increased from 330,239 to 361,391; and lead ore decreased from 694 to 586 tons.

Ore treated at concentrating plants in 1943 comprised nearly 99 percent of the State total output of ore; direct smelting ore 1 percent; the quantity of ore treated at amalgamation mills was negligible; and no ore was treated at cyanidation plants. Of the ore treated at concentrating plants, 7,477,738 tons were copper ore, 392,153 tons zinc-lead ore, 361,330 tons zinc ore, and 138 tons lead ore.

The following nine flotation mills treated 99 percent of the total New Mexico output of ore in 1943: Chino at Hurley; Empire Zinc at Hanover; Hanover Unit near Hanover; Bullfrog near Vanadium; Banner near Lordsburg; Peru near Deming; Waldo near Magdalena; Continental at Silver City; and Southwestern near Duncan, Ariz. (operating on ore from the Carlisle group in the Steeple Rock district, Grant County). The Chino reverberatory smelter of the Kennecott Copper Corporation at Hurley was operated throughout 1943 on company copper concentrates, siliceous copper ore, and copper precipitates recovered by leaching of waste dumps. Virtually all the copper production was marketed in the form of fire-refined copper bars. The destination and treatment of concentrates and ore produced by other operators in the State and shipped to smelters in other States are discussed in the following review by counties and districts.

Figures for the quantity of gravel handled at the 16 small placers worked in 1943 are not obtainable.

Mine production of metals in New Mexico in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	140	62	21	...	...	...
Concentrates smelted	360,796	3,581	376,853	[1] 149,476,321	11,143,411	119,026,000
Ore smelted	97,544	1,828	86,684	2,849,679	302,589	22,000
Placer	...	92	25	...	...	...
	...	5,563	463,583	152,326,000	11,446,000	119,048,000
Total, 1942	...	11,961	676,170	160,200,000	9,216,000	92,922,000

[1] Includes 27,744,537 pounds of copper recovered from smelting of precipitates from mine water and leached dumps.

Mine production of metals from amalgamation mills (with or without concentration equipment) in New Mexico in 1943, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal				
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Grant	30	42	14	---------	---------	---------	---------	---------
Santa Fe	110	20	7	---------	---------	---------	---------	---------
	140	62	21	---------	---------	---------	---------	---------
Total, 1942	[1] 29,302	[1] 3,365	[1] 226,829	---------	---------	---------	---------	---------

[1] Includes 28,802 tons of ore cyanided in 1942, yielding 3,195 ounces of gold and 226,787 ounces of silver; no cyanidation in 1943.

Gross metal content of concentrates (all produced at concentrating mills) from ores mined in New Mexico in 1943, by classes of concentrates smelted

Class of concentrates	Concentrates produced (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (wet assay) (pounds)	Lead (wet assay) (pounds)	Zinc (pounds)
Copper	223,763	8,202	163,037	[1] 151,048,639	128,131	---------
Lead	3,193	151	68,067	190,059	3,504,984	531,342
Lead-copper	6,092	455	114,064	757,332	5,950,834	1,139,840

CATRON COUNTY

Mogollon district.—Operated under lease by N. L. Brown from January 1 to February 15, 1943, the Bearup mine yielded 51 tons of dry gold-silver smelting ore containing 30.6 ounces of gold and 2,064 ounces of silver. In February the Silver Creek Mining Co. leased the property, continued to operate it the remainder of the year, and shipped 599 tons of dry gold-silver ore (containing 473.6 ounces of gold and 35,954 ounces of silver) to the El Paso smelter. Several carlots of clean-up material from the Lehigh Metals Co. Little Fanney mill, closed since June 1942, were shipped to the El Paso smelter.

COLFAX COUNTY

Mount Baldy district (*Baldy, Elizabethtown, Eagle Nest*).—A lessee sluiced during the summer at the Spanish Bar placer and recovered 22 fine ounces of gold and 3 ounces of silver.

DONA ANA COUNTY

Organ district.—The American Smelting & Refining Co. leased and operated the Merrimak mine from May 13 to September 15, 1943, and made regular shipments of zinc-lead sulfide ore to the company Hanover Unit selective-flotation zinc-lead custom mill at Hanover, Grant County. E. R. Woolley operated the Merrimak mine before the American Smelting & Refining Co. leased it; he shipped zinc-copper-lead-silver ore averaging 11 percent zinc to the Hanover Unit custom mill. A 1-ton lot of copper ore was shipped to the El Paso smelter from the Cowpuncher mine.

GRANT COUNTY

Burro Mountain district (*Tyrone*).—At its Burro Mountain mine 13 miles southwest of Silver City, throughout 1943, the Phelps Dodge Corporation continued leaching the old mine workings in place, by percolating water and precipitating copper from the resulting copper-bearing water. The copper content of the leach water and the production of precipitates decreased during the year compared with the 1942 production. L. Yacomo and Marvin Fuller continued production from the Full Moon mine until August 1943, when development failed to reveal additional ore. Zinc-lead sulfide ore totaling 1,581 tons was sent to the Continental Chemical & Ore Co. custom mill at Silver City and to the Hanover Unit custom mill. After closing the Full Moon property, Yacomo and Fuller opened the Contact group of claims and shipped 1,628 tons of zinc-lead sulfide ore to the custom mills at Silver City and Hanover.

Central district (*Bayard, Fierro, Georgetown, Hanover, Santa Rita*).—The Kennecott Copper Corporation Chino Mines Division, largest producer of copper in New Mexico, operated its open-pit mine at Santa Rita and its flotation mill and reverberatory copper smelter at Hurley above capacity throughout 1943. The total production of recovered copper approximated that of 1942. Copper was also recovered from leaching accumulated dump material from the pit and from siliceous copper ore used in the converters as a flux. Molybdenum, gold, and silver are recovered in the concentration mill as byproducts. Two short-head Symons crushers were installed in the secondary crushing plant at the 20,000-ton concentrator (true capacity of the mill at desired grind and optimum metallurgy is 18,000 tons per day). Other additions to the metallurgical plant in 1943 included an unloading and drying plant constructed at the smelter to facilitate handling of copper precipitates and a preheater for raising the temperature of the air used for combustion in the reverberatory furnace. Most of the copper produced at the smelter in 1943 was marketed in the form of fire-refined copper bars. The company also searched for zinc ore on two separated areas of company ownership in the Central district—one (the Oswaldo) adjoining the Empire Zinc Co. property, and the other (the Ivanhoe) a quarter of a mile northwest of the company precipitation plant on Santa Rita Creek. A three-compartment vertical shaft was sunk on each of these properties, and a total of 1,100 feet of drift was driven. The printed annual report of the Kennecott Copper Corporation for 1943 reports that, in connection with the development work at Chino Mines, occurrences of zinc ore have been found and that the prospect of discovering commercial bodies of zinc ore appears favorable.

Zinc production, in terms of recovered metal, in the Central district in 1943 was the greatest in the history of the district and exceeded the 1942 record production by 19,684,300 pounds (23 percent). This remarkable production increase, attained in spite of wartime difficulties caused by labor shortages, Government priorities, and absenteeism, made the Central district the fourth-largest zinc-producing district in the United States, exceeded only by the Tri-State region, New Jersey, and the Coeur d'Alene region, in the order named. The Peru Mining Co. operated its Pewabic and Copper Flat mines continuously during 1943. Development on the Kearny property adjacent to the Pewabic mine during the first part of 1943 proved enough ore reserves so that the company began production from this mine in March 1943. Ore from the Pewabic mine and that from the Copper Flat and Kearny properties, operated by the New Mexico Consolidated Mines Co., a Peru subsidiary, was shipped to the Peru Mining Co. 1,000-ton selective-flotation mill (average 700 tons per day in 1943) at Wemple near Deming (Luna County).

The Empire Zinc Co. operated its Hanover mine group and selective-flotation mill continuously in 1943. Besides ore from the company properties in the Central district, the mill treated ore from the company Lynchburg and Kelly mines at Kelly, Socorro County (credited to Socorro County). Most of the zinc concentrates produced were shipped to the New Jersey Zinc Co. Mineral Point Zinc Division plant at Depue, Ill.; byproduct lead concentrates produced were shipped to the El Paso smelter. The American Smelting & Refining Co. continued to operate its Ground Hog-San Jose property and the leased Hanover milling unit (formerly Combination-Black Hawk mill) throughout 1943. Extensive development was carried on at the Ground Hog property during 1943. An intensive diamond-drilling program was carried out in ground below the 1,600-foot level. The mine is developed by a three-compartment vertical shaft to the 600-foot level and then an inclined winze extending to the 1,800-foot level. During the fall of 1943 work was in progress to sink the winze to the 2,000-foot level. The Hanover milling unit operated at capacity (400 tons per day) throughout 1943, with a backlog input from the company Ground Hog-San Jose group, which produced in addition to zinc-lead-copper-silver milling ore a substantial tonnage of lead-copper-silver ore, which was shipped crude to the El Paso smelter. Approximately 35 percent of the total mill feed was custom ore from the Combination, Hobo, September, Little Goat, and Peerless mines in the Central district; the Columbia, Grandview, Royal John, Patsy, and Mineral Mountain properties in the Swartz (Carpenter) district; the Cleveland, Houston-Thomas, Manhattan, Silver Bell, and Silver Hill mines in the Pinos Altos district; the Contact and Full Moon properties in the Burro Mountain (Tyrone) district; the Hornet mine in the Eureka district; the Merrimak mine near Organ; the Ruth mine near Lordsburg; the Silver Hill property near Steins; the Percha mine near Kingston; the Nitt and Blue Hill mines at Kelly; and the Pennsylvania and Tom Payne properties near Cerrillos.

The United States Smelting, Refining & Mining Co. Bullfrog property at Vanadium contributed much to the increased production of zinc in New Mexico and Grant County in 1943. The selective-flotation mill at the Bullfrog mine began producing concentrates in March 1943. The mill was originally designed for 250 tons per day, but in the late summer additional crushing equipment and flotation units were added to raise the capacity to 400 tons per day. The mill heads contain principally zinc, with a little lead; the mill products are a leady-zinc and a zinc concentrate. Concentrates were shipped to the Dumas (Tex.) smelter and to the Anaconda Copper Mining Co. electrolytic zinc smelter at Great Falls, Mont. Several small shipments of crude ore were made to the El Paso smelter from the Little Goat, Boston Bicket, and Zuniga mines.

Ground sluicing of dry-wash gravels in Gold Creek recovered a little placer gold.

Eureka district.—The Mineral Production Co. operated the Hornet mine most of the year. Crude milling ore averaging 1.20 ounces of silver, 4.83 percent lead, and 6.37 percent zinc was shipped to the Hanover Unit custom mill and to the Shattuck Denn Mining Co. custom mill at Bisbee, Ariz. Two cars of lead-silver ore were shipped to the El Paso smelter.

Pinos Altos district.—R. R. Foster and Roy Tirey, lessees on the Cleveland mine, operated the property from February 20 to December 24, 1943, and shipped 4,046 tons of crude milling ore containing 19 ounces of gold, 17,136 ounces of silver, 45,440 pounds of copper, 47,789 pounds of lead, and 975,717 pounds of zinc to the Hanover Unit custom mill. A lessee on the Cleveland dump made regular shipments throughout the year to the Continental Chemical & Ore Co. custom mill at Silver City. W. S. Harrison operated the Manhattan mine the first 6 months of the year and shipped crude zinc-lead-copper-gold-silver ore to both the Continental Chemical & Ore Co. custom mill and the Hanover Unit custom mill. Lessees on the Houston-Thomas group shipped zinc-lead sulfide ore to the custom mills at Silver City and Hanover. Zinc-lead sulfide ore was also shipped to the Hanover Unit custom mill from the Silver Hill and Silver Bell mines. Crude smelting ore was shipped to the El Paso smelter from the Atlas, Houston-Thomas, and Nellie Bly mines.

Steeple Rock district.—The Exploration Syndicate, Inc., operated the Carlisle group of mines under lease and began production of zinc and lead concentrates in March 1943. Development during the year consisted of unwatering the mine to the 500-foot level and sinking a winze to the 700-foot level. Ore is milled at the Southwestern Minerals Co. mill at Duncan, Ariz.; lead concentrates were shipped to the El Paso smelter, and zinc concentrates were shipped to the Amarillo (Tex.) smelter.

Swartz (or Carpenter or Camp Monarch) district.—The Black Range Development Co. operated the Columbia and Grandview mines throughout the year and produced 5,416 tons of zinc-lead-silver ore which were trucked to the Hanover Unit custom mill. Other producing properties in the Swartz district, all of which shipped to the Hanover Unit custom mill, were the Patsy, Mineral Mountain, and Royal John mines.

White Signal district.—A shipment of 26 tons of copper ore was made during the year from the Liberty Bell claim.

GUADALUPE COUNTY

The Stauber mine near Pastura was operated continuously in 1943 by the Guadalupe Mining Co. Shipments to the El Paso smelter for the year amounted to 13,806 tons of siliceous copper ore containing 969,923 pounds of copper and 1,466 ounces of silver. The Pastura Copper Co. operated its mine northeast of Pastura from April 15 to September 6, when operations ceased because diamond drilling failed to find additional ore. During the period of operations, 3,521 tons of siliceous copper ore averaging 4.84 percent copper were shipped to the El Paso smelter.

HIDALGO COUNTY

Apache district.—A lessee operating the Monarch and Copper Crown claims of the Apache group shipped 207 tons of copper ore and 125 tons of lead ore to the El Paso smelter.

Lordsburg district.—The Banner Mining Co. operated the Bonney and Anita No. 1 mines and the company 500-ton flotation mill 6 miles south of Lordsburg continuously throughout 1943. The main vein, the Bonney, is opened by three shafts, the operating shaft (No. 2) and shafts 1 and 3 (about 400 feet on either side of shaft 2) which are used for ventilation and escapeways. The company proceeded to develop the lower levels of the mine and sank the main shaft an additional 42 feet, giving it a total depth of 1,482 feet at the end of the year. The mill treated an average of 300 tons of ore per day in 1943. The milling circuit is so arranged, however, that the daily tonnage handled can be increased to 500 tons. The product of the mill is copper-gold-silver concentrates which are shipped to the El Paso smelter. Following a Federal Bureau of Mines diamond-drilling program (which disclosed several bodies of commercial-grade copper ore) at the Atwood group of claims on Atwood Hill near Valedon, 4 miles south of Lordsburg, a lessee installed mining equipment, rehabilitated the Atwood shaft, and began producing ore in July. Shipments of siliceous copper ore to the El Paso smelter totaled 830 tons containing 129 ounces of gold, 9,794 ounces of silver, 58,107 pounds of copper, and 46,667 pounds of lead. The National Zinc Corporation, lessee on the Ruth property, continued to ship zinc-lead sulfide ore to the Hanover Unit custom mill (Grant County).

San Simon (Steins) district.—A lessee on the Silver Hill property 9 miles south of Steins shipped 138 tons of lead sulfide ore to the Hanover Unit custom mill (Grant County) in 1943. The Shattuck Denn Mining Co. operated the McGhee mine and lease until April 1943. Zinc-lead sulfide ore shipped to the Shattuck Denn custom mill at Bisbee, Ariz., totaled 742 tons containing 1.09 ounces of gold, 917 ounces of silver, 1,515 pounds of copper, 97,430 pounds of lead, and 66,803 pounds of zinc. R. C. Williams operated the Volcano group of claims (6 miles north of Steins) part of the year and shipped 1,634 tons of dry silver ore to the Miami (Ariz.) smelter.

Sylvanite district.—The Ida May group 10 miles southwest of Hachita was worked until July 1943 and produced 94 tons of copper-gold-silver ore.

LUNA COUNTY

Deming district.—At Wemple near Deming is the 1,000-ton Peru Mining Co. selective-flotation mill; it was operated 365 days in 1943 at an average daily rate of 700 tons on zinc sulfide ore from the company Pewabic, Copper Flat, and Kearny mines near Hanover, Grant County.

Tres Hermanas district.—The Contention mine yielded 61 tons of zinc ore, shipped to the Ozark pigment plant at Coffeyville, Kans.

SANDOVAL COUNTY

Cuba (Nacimiento Mountains) district.—In 1943 the San Miguel mine produced 13 tons of copper ore, which were shipped to the El Paso smelter.

SAN MIGUEL COUNTY

Willow Creek district (Terrero).—The Terrero Mining Co. made several shipments to the El Paso smelter of clean-up material from the dismantled Pecos mill in Alamitos Canyon..

SANTA FE COUNTY

Cerrillos district.—A. B. Stewart reopened the Tom Payne mine 8 miles north of Cerrillos early in 1943; he shipped 97 tons of zinc-lead sulfide ore to the Hanover Unit custom mill (Grant County). The Cerrillos Lead & Zinc Co., lessee on the Pennsylvania mine 12 miles northwest of Cerrillos, shipped 110 tons of zinc-lead sulfide ore to the Hanover Unit custom mill during 1943.

San Pedro or New Placers district.—A lessee worked the Candelaria mine 4 miles from Golden on a small scale and trucked the ore produced to his 10-ton amalgamation mill at Golden for treatment. At the St. Paul mine 40 tons of ore were mined and treated in an amalgamation mill.

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) district.—A small lot of copper ore was shipped from the New Era group of claims to the El Paso smelter. An operator on the War Baby mine shipped 140 tons of dry silver ore to the El Paso smelter.

Hermosa district.—The only output from the Hermosa district in 1943 was 3 tons of lead-silver ore from the Yankee Girl mine.

Kingston district.—The Percha mine in the Black Range west of Kingston was operated throughout 1943. Zinc-lead sulfide ore totaling 1,435 tons and containing 37.90 ounces of gold, 16,824 ounces of silver, 52,794 pounds of copper, 153,204 pounds of lead, and 231,931 pounds of zinc was shipped to the Hanover Unit custom mill (Grant County). A carlot of crude copper ore was also shipped from the Percha mine to the El Paso smelter.

SOCORRO COUNTY

Magdalena district.—The 1943 production of recoverable zinc and lead from the Magdalena district was the greatest in quantity since 1918. The Ozark Smelting & Mining Co. (subsidiary of the Sherwin-Williams Co.) continued to operate the Waldo mine and 250-ton selective-flotation mill until April 10, when the property was purchased by the American Smelting & Refining Co., which maintained production the remainder of the year. Concentrates produced were shipped to the Dumas (Tex.) smelter of the American Zinc Co. of Illinois, the El Paso smelter, and the Athletic Mining & Smelting Co. at Fort Smith, Ark. The Kelly Unit (Lynchburg and Kelly mines) of the Empire Zinc Co. was worked throughout the year by lessees who shipped zinc-lead ore to the Empire Zinc Co. selective-flotation mill at Hanover and dump ore to the Continental Chemical & Ore Co. custom mill at Silver City. A lessee on the Blue Stone mine shipped 96 tons of lead ore to the El Paso smelter. J. A. McDonald continued to operate the Nitt claim, shipping crude zinc-lead ore to the Hanover Unit custom mill (Grant County), to which also 1 carlot of zinc-lead ore was shipped from the Blue Hill claim.

TORRANCE COUNTY

Scholle district.—Two operators in the Scholle district shipped 220 tons of copper-silver ore to the El Paso smelter during 1943. Sporadically in the past, whenever copper prices were high, this district has shipped siliceous copper ore from shallow ore bodies in the "Red Beds."

GOLD, SILVER, COPPER, LEAD, AND ZINC IN OREGON

(MINE REPORT)

By Charles White Merrill

SUMMARY OUTLINE

	Page		Page
Summary	442	Mining industry	445
Calculation of value of metal production	442	Ore classification	446
Mine production by counties	445	Metallurgic industry	446
		Review by counties and districts	449

SUMMARY

Gold production in Oregon in 1943 sank to less than 1 percent of the all-time record set just 3 years earlier (in 1940) and was less than 3 percent of the output in 1942. Silver, lead, and copper production also dropped lower than had been reported in a decade. No recovery of zinc has been reported since 1937.

The total value of the gold, silver, copper, and lead (in terms of recovered metals) produced in Oregon was $48,038 in 1943 compared with $1,708,297 in 1942. It was divided among the metals as follows: Gold, 80 percent; silver, 16 percent; copper, 3 percent; and lead, 1 percent. Baker County continued to lead in metal output, but Jackson and Jefferson Counties each produced nearly as much; these three counties supplied 88 percent and the other three producing counties 12 percent of the State total.

Rising wages, enlistment of miners in the armed forces, migration of miners to war industries, rising costs of supplies and equipment and the difficulties of obtaining them, higher taxes, and a fixed price for gold and silver (principal metals produced in the State) were factors that continued to crush the industry in 1943 as they had done in 1941 and 1942. Production, which had sunk to approximately one-third of its 1940 level, quickly collapsed when the War Production Board issued Order L-208 on October 8, 1942. All the larger gold, silver, copper, lead, and zinc mines had suspended operations before January 1, 1943, and none resumed work during the year.

Lode mines contributed 81 percent and placers 19 percent of the gold produced in Oregon in 1943. For a number of years before 1942 lode mines had produced about one-third and placers two-thirds of the gold output.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787. [5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1939–43, and total, 1852–1943, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	116	201	69,025	93,372	$3,268,020	105,388	$71,536
1940	112	192	105,469	113,402	3,969,070	219,112	155,813
1941	91	153	98,160	96,565	3,379,775	276,158	196,379
1942	48	83	31,728	46,233	1,618,155	87,376	62,134
1943	16	16	2,680	1,097	38,395	10,523	7,483
1852–1943			(2)	5,668,118	126,347,173	5,187,681	4,767,004

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1939	96,000	$9,984	30,000	$1,410			$3,350,950
1940	176,000	19,888	70,000	3,500			4,148,271
1941	166,000	19,588	118,000	6,726			3,602,468
1942	206,000	24,926	46,000	3,082			1,708,297
1943	12,000	1,560	8,000	600			48,038
1852–1943	[3] 12,332	4,637,215	[3] 741	75,533	[3] 140	$13,846	135,840,771

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Figures not available.

[3] Short tons.

Gold produced at placer mines in Oregon, 1939–43, by classes of mines and by methods of recovery

Class and method	Mines producing [1]	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average per cubic yard
Surface placers:					
Gravel mechanically handled:					
Connected-bucket dredges:					
1939	5	6,267,000	25,028	$875,980	$0.140
1940	6	7,580,000	24,951	873,285	.115
1941	7	6,670,000	24,131	844,585	.127
1942	6	4,725,000	21,641	757,435	.160
1943					
Dragline: [2]					
1939	10	5,964,000	26,257	918,995	.154

1942	4	1,500	50	1,750	1.167
1943	2	250	10	350	1.400
Grand total placer:					
1939	201	13,322,000	60,779	2,127,265	.160
1940	[7] 192	16,684,000	71,577	2,505,195	.150
1941	153	14,646,000	60,430	2,115,050	.144
1942	83	8,150,000	38,336	1,341,760	.165
1943	16	41,000	208	7,280	.178

---

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.

[3] Gold from terminal clean-up; property and equipment not counted as producing.

[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included under "Small-scale hand methods"; no suction dredges reported for 1939–40.

[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.

[7] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

Gold.—Production of gold in Oregon in 1943 decreased almost 98 percent compared with 1942—the output from placers 99 percent and that from lode mines 89 percent. Hydraulic operations furnished 60 percent and small-scale hand methods 25 percent of the total placer gold. Virtually all the lode gold was derived from dry gold ore. There were 32 Oregon properties producing in 1943—16 lode mines and 16 placers; none produced as much as $5,500 worth of gold.

Silver.—Silver production in Oregon in 1943 decreased 88 percent compared with 1942. Jefferson County yielded 92 percent of the State total, dry gold ore over 99 percent, and smelting of flotation concentrates 83 percent.

Copper, lead, and zinc.—Copper production sank to 12,000 pounds, the lowest since 1933; lead output was 8,000 pounds, the lowest since 1932. No zinc was reported recovered.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, and lead in Oregon in 1943, by counties, in terms of recovered metals

County	Mines producing[1]		Gold					
	Lode	Placer	Lode		Placer		Total	
			Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Baker	8	1	378	$13,230	34	$1,190	412	$14,420
Curry	1	1	43	1,505	10	350	53	1,855
Grant		4			32	1,120	32	1,120
Jackson and Jefferson[2]	7	3	468	16,380	51	1,785	519	18,165
Josephine		7			81	2,835	81	2,835
	16	16	889	31,115	208	7,280	1,097	38,395
Total, 1942	48	83	7,897	276,395	38,336	1,341,760	46,233	1,618,155

County	Silver (lode and placer)[3]		Copper		Lead		Total value
	Fine ounces	Value	Pounds	Value	Pounds	Value	
Baker	676	$481	6,300	$819			$15,720
Curry	13	9					1,864
Grant	4	3					1,123
Jackson and Jefferson[2]	9,820	6,983	5,700	741	8,000	$600	26,489
Josephine	10	7					2,842
	10,523	7,483	12,000	1,560	8,000	600	48,038
Total, 1942	87,376	62,134	206,000	24,926	46,000	3,082	1,708,297

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Combined to avoid disclosure of individual outputs.

[3] Sources of total silver as follows—1943: 10,495 ounces from lode mines and 28 ounces from placers; 1942: 80,235 ounces from lode mines and 7,141 ounces from placers.

MINING INDUSTRY

Of the 2,680 tons of ore (including 37 tons of old tailings) sold or treated in Oregon in 1943 Baker County produced 1,283 tons or 48 percent, Jefferson County 1,248 tons or 47 percent, and Curry and Jackson Counties the remaining 149 tons of ore. Almost 99 percent of the ore (including old tailings) was dry gold ore, and the remainder was copper ore.

No connected-bucket dredge, dragline dredge, or nonfloating washing plant, to which gravel was delivered by mechanical means, was in production in 1943. However, final clean-ups at suspended operations resulted in the recovery of some gold, which is credited to dragline dredges and nonfloating washing plants. The only consumption of quicksilver reported for Oregon placer mines in 1943 was at hydraulic operations, where 33 pounds were consumed, or 1 pound of quicksilver for each 4 ounces of gold recovered in 1943 compared with 1 pound of quicksilver for each 30 ounces of gold recovered at hydraulic operations in 1942.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Oregon in 1943, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead
	Ore	Old tailings				
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Dry and siliceous gold ore	2,609	37	885	10,492	5,700	8,000
Copper ore	34		4	3	6,300	
Total, lode mines	2,643	37	889	10,495	12,000	8,000
Total, placers			208	28		
	2,643	37	1,097	10,523	12,000	8,000
Total, 1942	28,653	3,075	46,233	87,376	206,000	46,000

METALLURGIC INDUSTRY

Of the State total ore and old tailings (2,680 tons), 62 percent was treated at two concentrating mills, both using flotation; 31 percent was shipped crude to smelters; and 7 percent was treated in amalgamation and cyanidation mills, all without concentration equipment. Ultimate recovery of 47 percent of the total lode gold was from the smelting of ore and old tailings, 31 percent was as bullion from amalgamation of ore, 17 percent was from the smelting of concentrates, and 5 percent was as bullion from cyanidation of ore. All material requiring smelting was shipped out of the State, as Oregon has no smelters. No data are available covering quicksilver or cyanide consumption at Oregon mills in 1943.

Mine production of metals in Oregon in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Ore amalgamated	111	273	91		
Ore cyanided	90	43	10		
Concentrates smelted: Flotation	200	155	8,776	5,000	7,300
Ore and old tailings smelted	829	418	1,618	7,000	700

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 6 and their output included under "Combined counties and districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 10,495 ounces from lode mines and 28 ounces from placers.

[4] Output from a property not classed as a "mine."

[5] Greenback district lies in both Jackson and Josephine Counties.

[6] Includes following districts: Greenback in Jackson County; Ashwood in Jefferson County; and Waldo in Josephine County.

BAKER COUNTY

Baker district.—The Alex Johnson mine shipped gold ore to a smelter during 1943.

Cracker Creek district.—The Ellis Mining Co. recovered a small quantity of concentrates from 500 tons of dump ore run through the company mill to test the machinery; the concentrates, valued primarily for gold, were shipped to a smelter. In addition, a small quantity of gold ore was shipped to a smelter from the company holdings, which included the Eureka and Excelsior, Tabor Fraction, and Columbia mines.

Sparta district.—Gold ore produced at the Richfield mine was treated by amalgamation, and a small quantity was shipped for direct smelting.

Virtue district.—Anthony Brandenthaler took over the Gray Eagle mine in August 1943 and produced ore containing antimony, gold, silver, and copper; 249 tons of gold ore contained 47 ounces of gold and 29 ounces of silver; and 34 tons of copper ore containing 4 ounces of gold, 3 ounces of silver, and 6,511 pounds of copper were shipped to smelters. In addition, a small shipment of gold ore was made to a smelter by operators preceding Brandenthaler.

Weatherby district.—A. V. Lovejoy operated the Lovejoy Mines property in the Chicken Creek section of the Weatherby district intermittently during 1943; 25 tons of ore were amalgamated, from which 32 ounces of gold and 11 ounces of silver were recovered. A shipment of gold ore was made from the Surprise mine as a result of operations from March 1 to July 30, 1943.

CURRY COUNTY

Chetco district.—W. D. Bowser operated the Robert E. mine and cyanided 90 tons of ore which yielded 43 ounces of gold and 10 ounces of silver.

Sixes district.—J. C. Herren worked the Gable mine until March 6, 1943, and hydraulicked 8,000 cubic yards of gravel to produce 10 ounces of gold and 3 ounces of silver.

GRANT COUNTY

Canyon district.—Wallace Tracy hydraulicked at the Tracy claims during 1943.

JACKSON COUNTY

Gold Hill district.—Clarence Harrison worked the Black Channel mine on Hawkins Gulch by hydraulicking from January 3 to March 30, 1943, recovering 15 ounces of gold and 2 ounces of silver. Lance Bros. recovered 12 ounces of gold and 2 ounces of silver by hydraulicking on Foots Creek between January 20 and May 1. Exploration and development at the Solomon group resulted in the production of 36 tons of ore, from which 54 ounces of gold and 16 ounces of silver were recovered. Mardon Bros., lessees on the Sunrise mine, discovered a pocket and recovered 156 ounces of gold and 24 ounces of silver; this mine had the largest gold output in the State for 1943.

Greenback district.—H. B. Warner shipped high-grade gold ore, from intermittent operations at the Warner mine, to a smelter during 1943.

Upper Applegate district.—George R. Lewis hydraulicked on Sterling Creek from February 1 to June 1, 1943; 1,000 cubic yards of gravel yielded 20 ounces of gold and 3 ounces of silver.

JEFFERSON COUNTY

Ashwood district.—Operation of the Oregon King mine by Fenton and Silbaugh, sublessees, was terminated February 26, 1943, and Oregon King Mines, Inc., repossessed the property and carried on operations thereafter. Gold ore was treated in the company 50-ton flotation mill; gold concentrates and a small quantity of gold ore were shipped to a smelter. This mine was Oregon's leading producer of silver and lead in 1943.

JOSEPHINE COUNTY

Greenback district.—C. C. Clark hydraulicked 4,000 cubic yards of gravel at the Goff property between January 1 and May 15, 1943, recovering 14 ounces of gold and 2 ounces of silver.

Waldo district.—Homer White hydraulicked at the Llano de Oro mine from January 1 to May 8, 1943.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN SOUTH DAKOTA

(MINE REPORT)

By Chas. W. Henderson and R. V. Cushman

SUMMARY OUTLINE

	Page		Page
Summary	452	Mining and metallurgic industry	454
Calculation of value of metal production	452	Metallurgic recovery	454
Mine production by counties	454	Review by counties	455

SUMMARY

Metal mining in South Dakota for the production of gold, silver, copper, lead, and zinc was limited to Lawrence County in 1943. Gold mining, the principal mineral industry, experienced a severe set-back in 1943 as a result of the Gold Mining Limitation Order issued by the War Production Board. The two major gold mines still in operation on January 1, 1943—the Homestake mine at Lead and the Bald Mountain Mining Co. mines near Trojan—operated only until June 8, 1943, on reprieves granted them by the War Production Board to complete the milling of broken ore in the stopes. In 1943 the recovered output of gold in the State was 106,444 fine ounces valued at $3,725,540, compared with 522,098 ounces valued at $18,273,430 in 1942, an 80-percent decrease. Besides gold, South Dakota in 1943 produced 35,886 fine ounces of silver valued at $25,519; 82,000 pounds of recovered lead; and 92,000 pounds of recovered zinc. No placer gold was produced in 1943.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787. [5] $0.71111111.

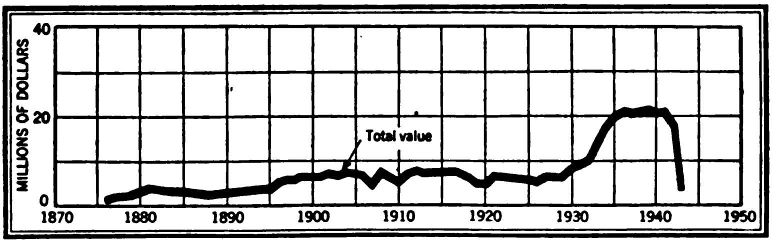

FIGURE 1.—Total value of mine production of gold and silver in South Dakota, 1876–1943.

MINING AND METALLURGIC INDUSTRY

Ore mined and treated at lode mines in South Dakota in 1943 totaled 204,932 tons yielding, in terms of recovered metals, 106,444 fine ounces of gold, 35,886 fine ounces of silver, 82,000 pounds of lead, and 92,000 pounds of zinc. An analysis of methods of treatment shows 183,246 tons treated by amalgamation followed by cyanidation of sands and slimes; 18,772 tons treated by cyanidation, part of which was roasted preceding cyanidation; and 2,914 tons treated by selective-flotation concentration.

METALLURGIC RECOVERY

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1939–43

Year	Ore treated	Gold in bullion	Silver in bullion	Quicksilver used
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*
1939	1,461,283	336,424.93	64,710	9,221
1940	1,479,905	313,964.15	60,254	4,997
1941	1,506,183	328,166.44	62,423	6,537
1942	1,275,138	276,298.00	56,852	3,561
1943	183,246	69,710.02	13,340	508

Gold and silver bullion produced at mills in South Dakota by cyanidation, 1939–43

Year	Material treated				Gold in bullion product	Silver in bullion product	Sodium cyanide used [1]
	Crude ore	Concentrates	Sands and slimes	Total			
	Short tons	*Short tons*	*Short tons*	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*
1939	170,270	[2]61	1,443,548	1,613,879	279,889.77	102,317	887,888

1942	161,635	[3]366	1,271,305	1,433,306	244,421.00	122,312	801,478
1943	18,772	....	178,318	197,090	36,675.52	17,964	[4]149,326

[1] In terms of 96- to 98-percent strength.

[2] From 1,143 tons of ore treated by flotation.

[3] From 17,614 tons of crude ore treated by table and jig concentration.

[4] Includes 263,165 pounds of calcium cyanide (48- to 49-percent strength); all reduced to equivalent of 96- to 98-percent strength to conform with earlier use of figures for high-strength NaCN and KCN.

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake mine.—Curtailed operations at the Homestake mine, owned and operated by the Homestake Mining Co. since 1877, were carried on from January through May 1943. They included only the hoisting and milling of 183,246 tons of broken ore (of higher grade than that milled in 1942) remaining in the shrinkage stopes. The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1943, says—

> Operation of the mine was suspended in accordance with Order L-208 of the War Production Board except for the hoisting and milling of ore previously broken, which was permitted until June 8, 1943, and maintenance work.
>
> Production from broken ore in shrinkage stopes amounted to 183,246 tons from which, together with recoveries from solutions and clean-up of the circuits, the realization was $3,629,507.33. The last ore was hoisted on May 26, 1943, and the final bullion shipment was made on June 8, 1943.
>
> The reserve of developed ore is 19,005,835 tons, which includes 91,685 tons of broken ore remaining in shrinkage stopes. This remaining broken ore is in stopes which were at a stage that would make resumption of stoping costly if the stopes were emptied.
>
> The campaign of cleaning up and shipping all possible iron and steel scrap was continued. Shipments during 1943 were as follows: Miscellaneous steel scrap, 2,204,820 pounds; manganese steel scrap, 510,340 pounds.
>
> In addition to maintenance work, the machine shops and foundry continued throughout the year on a variety of war production jobs. This war work entailed some preparation and the addition of some equipment to increase shop output.
>
> The sawmill at Spearfish, S. Dak., continued to operate at capacity producing commercial lumber. 98.9 percent of shipments was on orders with AA priority rating.
>
> As a result of the great reduction in the consumption of coal at the Homestake Power Station, production of coal from the Wyodak mine during the first 9 months of the year was the lowest in 15 years. Beginning in September, demand for coal by outside consumers increased rapidly and new production records were made in November and December. Results for the year were satisfactory.
>
> Through an agency contract with the Metals Reserve Co., your subsidiary, the Wyodak Coal & Mfg. Co., continued exploration for vanadium in western Wyoming and eastern Idaho. The exploration work ceased in November and the agency contract was terminated as of December 31, 1943.
>
> Option on the manganese property in Lower California, Mexico, was exercised. Small shipments of hand-sorted product were made during the year. Mill and plant are now under construction.
>
> The Homestake mine and plant have been maintained in excellent condition in order to be in readiness for operation when Government restrictions are withdrawn.
>
> Four hundred and twenty former employees are now with the armed forces.

Ore milled, receipts, and dividends, Homestake mine, 1939–43 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1939	1,400,015	$19,922,964.60	$14.2300	$9,041,760
1940	1,433,737	19,014,767.73	13.2624	9,041,760
1941	1,499,988	19,529,080.70	13.0195	9,041,760
1942	1,275,138	17,068,437.84	13.3856	7,534,800
1943	183,246	3,629,507.33	19.8067	----------

[1] From 1876 to 1943, inclusive, this mine yielded bullion and concentrates that brought a net return of $439,239,773 and paid $149,805,802 in dividends.

No development was done by the company in 1943. Surface treatment plants operated (besides the primary crushing plants at the hoists) comprised the South mill, which includes the main secondary crushing (including 180 stamps), grinding, and amalgamation plant, with a capacity of 3,800 tons per 24 hours, cyanide sand plant No. 1 (capacity 1,600 tons per 24 hours), cyanide sand plant No. 3 (capacity 600 tons per 24 hours), and the refinery, all at Lead; and the slime plant at Deadwood (capacity 2,000 tons per 24 hours). Gold bullion was shipped to the Denver Mint.

Other mines.—The Bald Mountain Mining Co., the only other producing gold-mining company in the State in 1943, operated its consolidated group of mines and 370-ton all-sliming cyanide mill at Trojan under a War Production Board reprieve until June 8, 1943. Ore was produced from the Portland, Dakota, and Clinton claims, and a daily average of 124 tons was treated at the mill. A total of 18,772 tons of dry gold ore was milled, from which 2,714 fine ounces of gold and 11,240 fine ounces of silver were recovered. Following primary crushing, the refractory sulfide ores not amenable to treatment by straight cyanidation (about 15 percent of the ore produced) are by-passed, dry rod-milled to 10-mesh, roasted in the 110-ton gas-fired rotary hearth furnace, and then returned to the mill circuit and mixed with the oxide ores for cyanidation. The net return from metals produced in 1943 was $102,387.

The Belle Eldridge Gold Mines, Inc., operated continuously throughout 1943 its group of claims in Spruce Gulch in the Whitewood district, 2 miles south and east of Deadwood. Production came entirely from the Helen Gould and Josie claims and was milled at the company 50-ton selective-flotation mill on the property. Lead concentrates assaying 0.525 ounce of gold and 31.5 ounces of silver per ton, 45.95 percent lead (wet assay), and 6.81 percent zinc were shipped to the Leadville (Colo.) smelter, and zinc concentrates assaying 0.043 ounce of gold and 2.86 ounces of silver per ton, 1.97 percent lead (wet assay), and 48.79 percent zinc were shipped to the smelter at Amarillo, Tex. Development in 1943 consisted of 250 feet of drifts, 500 feet of tunnel, and 1,538 feet of diamond drilling.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN TEXAS

(MINE REPORT)

By Chas. W. Henderson and R. H. Mote

Calculation of value of metal production	457
Mine production	458
Ore classification	458
Smelting and refining plants in Texas	459
Mines review by counties	459

SUMMARY

Mines in Texas produced (in terms of recovered metals) 4 fine ounces of gold, 10,284 fine ounces of silver, 162,000 pounds of copper, and 26,000 pounds of lead in 1943, having a total value of $30,463, compared with 236 ounces of gold, 672,781 ounces of silver, 198,000 pounds of copper, and 362,000 pounds of lead in 1942, having a total value of $534,894.

From 1885 through 1942 silver has been the principal metal produced in Texas, and most of the output has come from the Presidio mine at Shafter, Presidio County. This property ceased operations in September 1942; soon afterward all equipment at the property was dismantled and sold. Recovery of some gold and lead with the silver has made this mine the largest all-time producer in the State of these metals also. The silver produced in 1943 came largely from the Hazel mine in Culberson County and the Plata Verde mine in Hudspeth County. Dry silver ore from the Sancho Panza mine, also in Hudspeth County, and the Hazel mine yielded the bulk of the copper. Virtually all the lead produced came from the Diablo mine in Hudspeth County. No zinc has been recovered from ores mined in Texas since 1917.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939-43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

---

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939-41: Yearly average weighted price of all grades of primary metal sold by producers; 1942-43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1939 to 1943, as well as the total metal production from 1885 to 1943.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1939–43, and total, 1885–1943, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1939	141,795	324	$11,340	1,341,945	$910.896
1940	146,936	312	10,920	1,326.150	943.040
1941	140,818	306	10,710	1,096.027	779,397
1942	100,698	236	8.260	672,781	478.422
1943	4,134	4	140	10,284	7,313
1885-1943	(1)	8,281	223,780	33,196,821	23.360,028

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value

Mine production of gold, silver, copper, and lead in Texas in 1943, by counties, in terms of recovered metals

County	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Culberson	2	1,223		5.926	44,000	
Hudspeth	6	2.911	4	4,358	118,000	26,000
	8	4.134	4	10,284	162.000	26,000
Total, 1942	7	100,698	236	672,781	198.000	362,000

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Texas in 1943, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Dry and siliceous gold ore	1	39	4	43		2,699
Dry and siliceous silver ore	5	3,601		9,988	135,239	466
Copper ore	1	339		98	19,761	
Lead ore	1	155		155	7,000	22,835
	8	4,134	4	10.284	162,000	26,000
Total, 1942	7	100,698	236	672,781	198,000	362,000

SMELTING AND REFINING PLANTS IN TEXAS

In 1943 two horizontal-retort zinc smelters (one has a cadmium (metal)-recovery plant), one electrolytic zinc smelter (with a cadmium (metal)-recovery plant), one copper smelter, one lead smelter, one antimony smelter, one tin smelter, three magnesium plants (two designed to extract magnesium electrolytically from sea water), and one electrolytic copper refinery were in operation in Texas.

The American Smelting & Refining Co. continued to operate its copper and lead smelters in El Paso in 1943, treating domestic ores and concentrates purchased from operators in Arizona, New Mexico, Texas, and Virginia, and foreign ores and concentrates purchased from operators in Mexico, Bolivia, Ecuador, Chile, and southwestern Africa. Lead concentrates produced at the company mine at Buchans, Newfoundland, were also treated at the El Paso lead smelter.

The American Smelting & Refining Co. gas-fired horizontal-retort zinc smelter at Amarillo operated throughout the year on zinc concentrates purchased from operators in Arizona, Colorado, New Mexico, Montana, Nevada, and South Dakota and in Mexico. The company was unable to operate the smelter at more than half capacity, however, due to the serious shortage of skilled smelter workers in the area. The company electrolytic zinc plant at Corpus Christi operated throughout the year (successful operations of this unit began in August 1942) but treated only foreign concentrates, some of which came from American Smelting & Refining Co. operations at Buchans, Newfoundland.

The Machovec gas-fired horizontal-retort zinc smelter of the American Zinc, Lead & Smelting Co. at Dumas was operated throughout the year, but only at half capacity because of an acute shortage of experienced smelter workers. Production of cadmium at the cadmium-recovery plant was increased substantially during the latter half of 1943.

Blister copper anodes produced at Phelps Dodge Corporation smelters in Arizona continued to be refined in the corporation Nichols electrolytic refinery at El Paso.

The Federal Bureau of Mines maintained several projects in Texas in 1943 to determine potential sources of strategic war metals. These projects included: Tests for the production of sponge iron from a deposit in the Longview section of east Texas; exploration of celestite deposits in Nolan County for the production of strontium; exploration of mercury deposits at Terlingua on the Rio Grande in west Texas; drilling of zinc deposits in Hudspeth County, west Texas; and exploration of fluorspar deposits near Van Horn.

MINES REVIEW BY COUNTIES

Culberson County.—Dry silver ore totaling 1,218 tons, containing 5,801 ounces of silver and 45,645 pounds of copper, was shipped to the El Paso smelter from the Hazel mine in the south end of the Sierra Diablo Range 14 miles northwest of Van Horn; A. P. Williams operated the property in 1943. A small lot (5 tons) of dry silver ore, containing 125 ounces of silver and 144 pounds of copper, was shipped to the El Paso smelter from the Needle Peak open-cut mine near Van Horn.

Hudspeth County.—Lessees on the Black Shaft mine in the Allamoore district 9 miles northeast of Allamoore shipped 339 tons of copper ore, containing 98 ounces of silver and 20,584 pounds of copper, to the El Paso smelter. Intermittent operations during the year at the Diablo mine produced 155 tons of lead ore containing 155 ounces of silver, 10,445 pounds of copper, and 26,006 pounds of lead. A lessee worked the Michael Robert mine during the first half of 1943 and shipped 395 tons of dry silver ore, containing 78 ounces of silver and 17,041 pounds of copper, to the El Paso smelter. M. F. Drunzer operated the Sancho Panza mine 7 miles northeast of Allamoore from January to June 1943 and shipped 1,727 tons of dry silver ore containing 739 ounces of silver and 75,607 pounds of copper. J. S. Barlow and associates operated the Bona mine 6 miles southwest of Sierra Blanca from August to October 1943 and produced 39 tons of dry gold ore containing 3.50 ounces of gold, 43 ounces of silver, 2,999 pounds of lead, and 1,440 pounds of zinc. A lessee on the Plata Verde mine 14 miles southwest of Van Horn shipped 256 tons of dry silver ore, containing 3,245 ounces of silver and 1,758 pounds of copper, to the El Paso smelter.

Presidio County.—From 1885 to September 1942, when the property was shut down, the Presidio mine at Shafter produced (in terms of recovered metals) 30,293,606 ounces of silver. All surface and underground equipment was dismantled and moved from the property during the early part of 1943.

Production of silver from the Presidio mine from 1885 to 1942 is shown in the table on page 480 of Minerals Yearbook, 1942.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN UTAH

(MINE REPORT)

SUMMARY

The total value of the gold, silver, copper, lead, and zinc produced from Utah ores and gravels in 1943 was the greatest in the history of the State and exceeded that of any other State in the Union. This value was, in terms of recoverable metal, $124,562,540 compared with $113,552,848 in 1942, a 10-percent gain. The larger output of copper and zinc, plus a higher average price for the base metals, accounted for the gain. Production of gold, silver, and lead showed decreases. The total advance in value of the State metal output can be credited almost entirely to the Bingham district, although the Tintic district gained in output of zinc and the Park City region in output of lead. The Utah Copper Co. exceeded its previous record production and supplied about 76 percent of the value of the total metal output of the State. The output of silver and zinc from Tooele County increased, whereas that of each of the other metals decreased.

The full productive capacity of Utah mines was not reached in 1943, as the stimulating effect of premium prices was more than offset by a critical shortage of labor. The shortage became very acute during the summer months, and to offset a declining production of base metals the Army again furloughed about 4,500 soldiers to base-metal mines in the West. Of this number the Utah mines received about 400. The soldiers were released only to copper, zinc, and molybdenum mines, and to these classes of mines according to the stated request of each mine for labor and according to its productivity per man-shift. Several mines, particularly those producing large quantities of lead, were unable to qualify for soldiers; however, some of these mines were later given an opportunity to hire soldiers rejected for physical reasons, who, although not completely satisfying requirements, did tend to bring the crews to an operating minimum. Very few among them could meet the minimum requirements of an experienced miner. At the end of 1943, about 85 percent of the former soldiers were still employed by the mining companies.

The Government policy of premium payments for overquota production was in force throughout 1943; however, toward the end of 1943 certain modifications in the program were necessitated by increased mineral production, revised military requirements, a greater need for marginal manpower than marginal production, and the success of efforts toward balancing the metal supply with the requirements of the armed forces and the most essential civilian uses. Accordingly, on October 27, the War Production Board took the following action. Premium prices in the B range for lead mines and the B and C ranges for zinc mines were denied to mines not already operating and to mines having a low labor productivity and in areas of serious labor shortage. The Government will not now finance new zinc projects. On November 9 the Board stated that after December 31, 1943, no applications for special copper premium prices under the plan effective since May 1, 1943, would be considered.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075

[1] 1864–1901: Figures not available; 1902–43: 493,734,369 tons produced.

[2] Short tons.

Gold.—Although virtually all the mines active in Utah in 1943 were primarily base-metal mines, the State gold production exceeded that of any other State. The production in 1943 was 390,470 fine ounces compared with 391,544 ounces (highest in the State's history) in 1942. Base-metal ores yielded 92 percent of the State total, and siliceous ores virtually all the rest; placer-gold production was negligible. The gold-mine closing order issued in October 1942 has had little effect on the Utah gold production; however, the order has made it more difficult for the smelters in the Salt Lake Valley to meet the requirements of silica for flux. Only two mines producing gold ore in quantity were active in 1943; these, because of the siliceous nature of their ore, had received permission from the War Production Board to remain in operation. Copper ore furnished 79 percent of the State gold, and siliceous ores 8 percent; the remainder came from zinc-lead ore, slag, lead ore, zinc ore, zinc-lead-copper ore, lead-copper ore, and placers. Ores of the Bingham district, by far the most important gold-producing area in Utah, yielded 343,551 ounces—a gain of 16,293 ounces compared with 1942; however, this gain did not offset the losses from the Park City region, the Tintic district, and the Camp Floyd district (in Tooele County). The gain in the Bingham district was the result of extraordinarily large production of byproduct gold from operations at the Utah Copper Co. and of smaller gains from the National Tunnel & Mines Co. and the Boston Consolidated properties. The Tintic district produced 22,470 ounces of gold and was second in importance

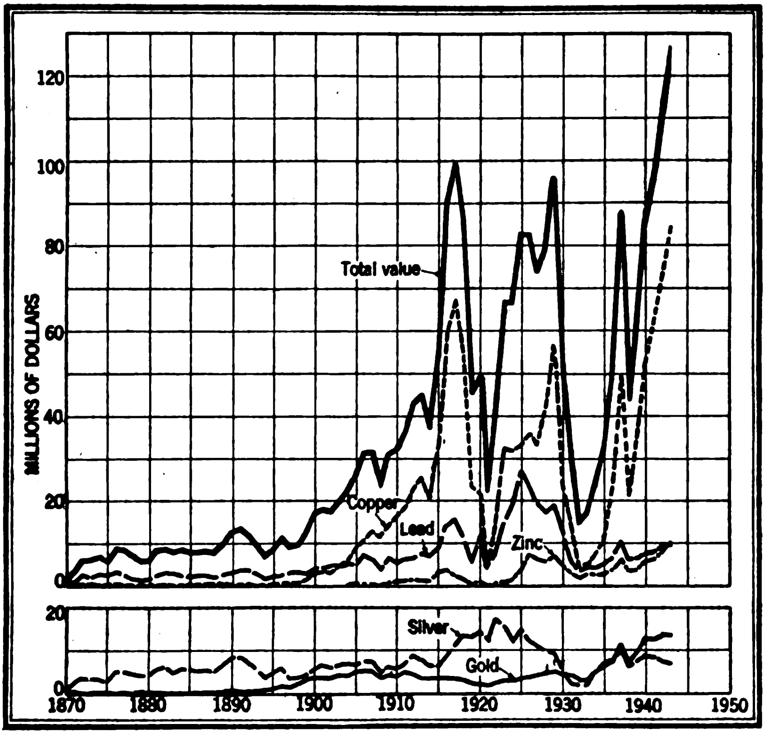

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Utah, 1870–1943.

as a gold producer; the decrease from 1942 was due to the smaller quantity of siliceous ore. The Park City region, third in importance, in 1943 produced 19,559 ounces of gold, a decline of 3,376 ounces compared with 1942; gains at the New Park Mining Co. did not offset losses at the Silver King Coalition Mines Co. and the Park Utah Consolidated Mines Co. Tooele County showed a notable decrease in 1943, as the gold mines in the Camp Floyd district produced a much smaller quantity of gold than in recent years. Ores of all classes treated in concentrating mills yielded 90 percent of the State total gold and ore shipped direct to smelters, slag fumed, and placers the remainder.

The Utah Copper Co. produced about 79 percent of the State production of gold and was followed by the United States & Lark mines at Bingham, the New Park Mining Co. property in the Park City region, the Tintic Bullion property in the Tintic district, the Boston Consolidated property in the Bingham district, the Eureka Bullion property in the Tintic district, the Mammoth mine in the Tintic district, and the Tintic Standard mine in the Tintic district; these eight properties produced 95 percent of the State total.

Silver.—The output of recoverable silver in Utah in 1943 was 9,479,340 fine ounces, a decrease of 10 percent compared with 1942. Production from mines in the Bingham district was slightly more and in Tooele County considerably more than in 1942, but substantial decreases were noted in the Park City region and the Tintic district. Zinc-lead, zinc, and zinc-lead-copper ores yielded 48 percent of the State total, copper ores 31 percent, siliceous ores 16 percent, and lead and lead-copper ores 5 percent. Ore concentrated yielded 79 percent of the State total and crude ore shipped direct to smelters virtually all the remainder. The Bingham district continued to be the chief source of silver, followed by the Park City region, the Tintic district, and Tooele County.

The Utah Copper mine was again the chief silver producer in the State, followed by the United States & Lark, Silver King Coalition, Tintic Standard, Mayflower, Park Utah Consolidated group of properties, Calumet, Harold (dump), and Chief Consolidated group of properties; these properties produced 87 percent of the State output of silver.

Copper.—The output of recoverable copper in Utah in 1943 was 647,978,000 pounds, or 34,596,000 pounds more than in 1942. This output surpassed by far that of any year in the history of the State. The Utah Copper Co. exceeded its previous production record and accounted for almost the entire gain in copper output, although gains were noted also in the National Tunnel & Mines Co. operation. The Utah Copper Co. mined about 80,000,000 tons of ore and waste in 1943 at its open-pit mine at Bingham, at the rate of 1¼ tons of waste to 1 ton of ore. The company mills at Magna and Arthur treated about 97,000 tons of copper ore a day, although the rated capacity of the plants is only about 78,000 tons. Copper ore mined in Utah totaled 35,999,656 tons in 1943, compared with 33,611,061 tons in 1942; the total value of the gold, silver, copper, and lead recovered from copper ore and precipitates was $96,126,788, or 77 percent of the State total value of all five metals.

Following the Utah Copper Co., the chief copper producers in Utah included the National Tunnel & Mines Co., Ohio Copper Co., United States & Lark mines, and the Boston Consolidated mine—all in the Bingham district.

During the first 4 months of 1944 Utah was producing about 52,000,000 pounds of copper a month—a rate calculated to show a decrease during the year of 24,000,000 pounds compared with 1943.

Lead.—During 1943 the principal lead-producing mines in Utah experienced an acute shortage of labor, and little help was given by the Army when soldiers were furloughed for service in base-metal mines. The output of lead in Utah was 130,514,000 pounds of recoverable metal compared with 143,860,000 pounds in 1942. Decreases were noted in each of the chief lead-producing areas except the Park City region. The Bingham district remained the principal lead-producing area in the State, although an 11-percent decrease was noted; losses at the United States & Lark mines accounted for virtually all the decline. The Tintic Standard mine in the Tintic district caused the decrease in that district; whereas in the Park City region increased lead output from the Silver King Coalition mine, the Park Utah Consolidated mine, and the New Park Mining Co. property in 1943 more than offset the loss sustained by the closing in 1942 of the Park City Consolidated mine; the New Park Mining Co. increased greatly its lead output compared with 1942. A considerable quantity of lead was recovered in 1943 from the treating of siliceous ore dumps from the Tintic district; most of this material contained about 3 percent lead and was shipped crude to smelters for flux. The Calumet mine was again the chief lead producer in Tooele County.

The United States & Lark property in the Bingham district was the chief producer of lead in Utah, followed by the Silver King Coalition and Park Utah Consolidated mines in the Park City region, Tintic Standard mine in the Tintic district, Mayflower mine in the Park City region, Calumet mine in Tooele County, Chief Consolidated properties in the Tintic district, and Hidden Treasure mine in Tooele County; these eight properties produced 89 percent of the State total.

Production reports received during the first 4 months of 1944 indicate that the lead production in 1944 will show a decrease of about 6,500,000 pounds compared with 1943. A shortage of experienced labor may result in an even greater decline.

Zinc.—The production of recoverable zinc in Utah rose from 91,086,000 pounds in 1942 to 93,792,000 pounds in 1943. Zinc recovered from old and current slag accounted for most of the gain, as zinc recovered from zinc-lead ores and zinc ores was about the same as in 1942. As in former years, mines in the Bingham district and the Park City region were the principal sources of zinc in Utah; although there was a slight gain in the Bingham district it was more than offset by losses in the Park City region. Substantial gains were noted from mines in the Tintic district, but this district is of minor importance compared with the Bingham and Park City areas. Slight gains at the United States & Lark and Butterfield properties brought about the rise in the Bingham district. Losses at the Silver King Coalition and Park Utah Consolidated mines more than offset a gain of over 3,000,000 pounds at the New Park Mining Co. property in the Park City region. The Chief Consolidated mine produced virtually the entire output from the Tintic district in 1943. The Calumet mine in Tooele County showed a slight increase. All zinc and zinc-lead concentrates produced in Utah in 1943 were treated at the Anaconda and Great Falls (Montana) zinc plants of the Anaconda Copper Mining Co. Zinc fume derived from the fuming of current slag, cold slag, and crude ores was first deleaded and then shipped to Bartlesville, Okla., for further treatment. The zinc recovered from the fuming of current slag and crude ores has not been credited entirely to Utah; the zinc ultimately recovered from the fuming operation, which originates from ores and concentrates containing at least 6 percent zinc, has been credited (along with the tonnage of ore and concentrates) to the State of origin.

The principal producers of zinc in Utah in 1943, named in order of output, were: United States & Lark mines, Tooele slag-fuming plant, Mayflower mine, Park Utah Consolidated mines, Silver King Coalition property, Chief Consolidated properties, Calumet mine, and Butterfield group of properties; these eight properties produced 96 percent of the State total zinc.

According to calculations based on reports received during the first 4 months of 1944, the recoverable zinc output of Utah in 1944 will be about 96,000,000 pounds; however, this production will not be reached should the anticipated acute labor shortage be realized.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1943, by counties, in terms of recovered metals

County	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (all lode)

[1] Includes 4 ounces of placer gold in Millard County.

[2] Includes 32 ounces of placer gold distributed as follows: Grand County, 7 ounces; Millard County, 3 ounces; San Juan County, 8 ounces; and Uintah County, 14 ounces.

MINING INDUSTRY

The production of copper ore (96 percent of the State total ore) continued to dominate the mining industry in Utah in 1943. The Bingham district produced ore of all classes, representing 98 percent of the State total. Of the total of 36,532,301 tons of ore produced from mines in the Bingham district, copper ore constituted 99 percent and zinc-lead ore and lead ore nearly all the remainder. The grade of the copper ore was about the same as in 1942, whereas the zinc-lead ore showed a lower lead but a slightly higher zinc content. The bulk of the ore produced from mines in the Park City region was zinc-lead ore, although substantial tonnages of zinc tailings were milled and siliceous tailings were shipped direct to smelters. The ore from the Park City region showed a lowering of the gold, silver, copper, and zinc content compared with 1942. The Tintic district again made a large gain in output of zinc-lead ore, but almost all continued to come from the lower workings of the Chief Consolidated properties. The output of zinc-lead ore from Tooele County was about the same as in 1942. There were substantial decreases in the quantity of high-silica ores shipped direct to smelters in 1943. Much of the output of siliceous ores in 1943 was from mine dumps and tailings piles. The largest declines in siliceous ore output were noted in the Tintic district in Juab and Utah Counties and the Camp Floyd district in Tooele County; however, the Camp Floyd and Tintic continued to supply most of the siliceous ore of the State.

The mining industry in Utah received considerable aid from various Government agencies. The Bureau of Mines gave much engineering assistance to both metal and nonmetal mines in 1943 and in addition assisted materially in the exploration and developing of many properties in the State. The Grazing Service spent over $600,000 on access roads in Utah; however, these roads were not limited to metal mines but were built to serve all classes of mining in the State. The Reconstruction Finance Corporation continued to give financial assistance to mines considered capable of producing needed minerals.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Utah in 1943, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	11	68, 085	16, 992	80, 645	2, 205, 943	76, 548	----------

Total, 1942	129	34, 981, 655	391, 544	10, 574, 955	[4] 613, 382, 000	143, 860, 000	91, 086, 000

[1] Includes 27,987,429 pounds recovered from mine-water precipitates.

[2] Includes 109,042 tons of zinc slag.

[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

[4] Includes 32,062,916 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

In 1943 Utah mines produced 37,386,731 tons of ore, again exceeding the production for any year in the history of the State. This total was treated as follows: 36,880,347 tons at concentrating mills compared with 34,336,812 tons in 1942; 397,342 tons of ore shipped crude to smelters compared with 460,710 tons in 1942; and 109,042 tons of slag fumed compared with 87,831 tons in 1942. Although most of the crude ore shipped direct to smelters was siliceous and used by the smelters for flux, the State did not produce a large enough quantity of siliceous ore in 1943 to meet the smelter requirements. Most shippers of siliceous dumps and tailings sold their product to the smelters according to the assay content, so that the shipments might be entitled to any premiums allowed by the Government.

Eleven concentrating mills were active in Utah during 1943. Four plants (Arthur, Magna, Ohio Copper, and Tooele) treated 35,996,280 tons of copper ore and old tailings. Four mills (Bauer, Midvale, Silver King, and Tooele), with a combined rated capacity of about 4,000 tons daily, treated 763,967 tons of ore, mostly lead, zinc-lead, zinc-lead-copper, and zinc. One gravity-concentration mill in Tooele County treated 100 tons of silver ore, and one flotation mill in Summit County treated 120,000 tons of old zinc tailings. Three large custom-milling plants—the Midvale concentrator, the Tooele concentrator, and the Bauer concentrator—treated most of the zinc-lead, zinc-lead-copper, lead, and zinc ores milled in Utah in 1943. Most of the feed to the Midvale concentrator came from company-owned mines in the Bingham district, principally the United States & Lark mines. The greatest part of the mill feed in the Bauer mill came from company-owned mines in the Rush Valley and Bingham districts in Utah and the Triumph mine in Idaho. The Tooele concentrator received the larger part of its mill feed from the Park Utah Consolidated property in the Park City region. Aside from the ores treated from mines in Utah, these mills received substantial quantities of ore from mines in California, Nevada, Idaho, Colorado, and Montana. The Tooele concentrator at Tooele, owned and operated by the International Smelting & Refining Co., comprised three sections, each of about 500 tons daily capacity—a copper section, an oxide and zinc-copper section, and a zinc-lead section. The copper section treated copper ores from the National Tunnel & Mines Co. property, the oxide section treated lead ores from the Tintic Standard mine, and the zinc-copper section treated ores principally from mines in California.

Both the Garfield copper smelter at Garfield, operated by the American Smelting & Refining Co., and the Tooele copper smelter at Tooele, operated by the International Smelting & Refining Co., were active throughout 1943. The combined rated capacity of the charge was about 1,900,000 tons. The Garfield smelter had available copper concentrates in excess of its capacity, which was reduced chiefly by a labor shortage; as a result, copper concentrates from Utah were treated at the McGill smelter in Nevada, the Tacoma smelter in Washington, and the El Paso smelter in Texas. Three lead smelters—the Murray plant of the American Smelting & Refining Co., the Midvale plant of the United States Smelting, Refining & Mining Co., and the Tooele plant of the International Smelting & Refining Co.—had a combined rated capacity charge of about 1,330,000 tons. The Murray plant operated intermittently in 1943 and during the latter half of the year began treating considerable ore, concentrates, and residue for the arsenic content. The other two lead smelters were operated continuously during the year. Smelters in Utah received ores, concentrates, and residues, principally from Arizona, California, Idaho, Montana, Nevada, and Colorado, and from Virginia, Missouri, and Illinois.

Mine production of metals in Utah in 1943, by methods of recovery, in terms of recovered metals

[1] All lode except 4 ounces from a placer in Millard County.

[2] Tintic district lies in both Juab and Utah Counties.

[3] All placer.

BEAVER COUNTY

Beaver Lake district.—Lessees operated the O.K. mine from February 1 to November 1, 1943, and shipped crude copper ore and crude siliceous ore direct to smelters.

Pine Grove district.—The Wah Wah Mining Co. operated its property from March 1 through December 1943. During the period of operation the company shipped 138 tons of ore, comprising 47 tons of zinc-lead ore to the Tooele concentrator and 91 tons of siliceous ore to smelters. Considerable aid was afforded the company in its development program by various Government agencies. The Reconstruction Finance Corporation made available a loan of $20,000; the Grazing Service built several miles of access roads; and the Bureau of Mines did considerable development on the property, including 145 feet of drifting and 200 feet of diamond drilling. As a net result of the aid received, the company reports that ore reserves exposed include 38,500 tons of oxide zinc ore, 8,000 tons of zinc-lead sulfide ore, and 20,000 tons of oxidized silver-lead ore.

Rocky district.—Lessees operated the Montreal and Old Hickory group in 1943 and shipped 483 tons of crude copper ore direct to Garfield.

San Francisco district.—Hall Bros. Co., Inc., operated the dump of the Horn Silver mine under lease from January 1 to April 29, 1943. During the period of operation, 5,946 tons of crude gold-silver dump ore were shipped direct to Garfield and 102 tons of zinc-lead ore to the Bauer mill; in addition, A. E. Kipps shipped 1,116 tons of gold-silver dump ore to Garfield. The branch railroad line connecting Frisco with Milford was abandoned and the tracks were removed in July. A lessee shipped crude lead ore and crude silver ore direct to smelters from the Quad Metals dump.

Star and North Star district.—Lessees operated the Moscow Silver Mines Co. property in 1943 and shipped 2,136 tons of rich zinc ore to the Bauer mill.

BOX ELDER COUNTY

Crater Island district.—A small lot of gold-copper ore was shipped direct to Garfield from the Copper Blossom mine in 1943.

Lucin district.—Some crude lead ore was shipped to Murray from the Copper Mountain mine in 1943.

Promontory district.—Crude oxidized zinc-lead ore was shipped to the Tooele lead plant from the Lake View Carbonate mine by the Lakeview Mining Co. in 1943.

IRON COUNTY

Indian Peak district.—The New Arrowhead Mining Co. operated its property from March 16 to December 31, 1943, and shipped zinc-lead and zinc ores to the Tooele lead plant and Tooele slag-fuming plant. The company received a Reconstruction Finance Corporation loan for $15,000 in 1943 for the purpose of developing its property. The Federal Grazing Service built an access road to the property.

JUAB COUNTY

Detroit district.—The Detroit district lies in both Juab and Millard Counties, but in 1943 all the output came from the Juab County section and was crude gold ore shipped to Garfield from the Copperhead mine.

Fish Springs district.—Crude lead ore shipped to smelters from the Utah Mines group, Black Dragon, and Mill John mines comprised the output from the Fish Springs district in 1943.

Mount Nebo district.—A test lot of crude lead ore was shipped to Murray from the Central Sultana mine in 1943.

Spring Creek district.—A small lot of lead-copper ore was shipped direct to a smelter from the New Premier mine in 1943.

Tintic district.—The Tintic district, which lies in both Juab and Utah Counties, is reviewed here. The table that follows gives the metal production in each section of the district in 1943, a comparison with the total in 1942, and the grand total from 1869 to 1943.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1942–43, and total, 1869–1943, in terms of recovered metals

	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value

[1] Figures not available.

During 1943, as in previous years, the Tintic district was the principal source of highly siliceous ores that are used both as reverberatory and convertor flux at the copper smelters in the Salt Lake Valley. The elimination of considerable siliceous ores through the closing of some properties and greater emphasis on the mining of zinc-lead ores by others has caused some concern at the copper smelters.

In 1943 the Chief Consolidated Mining Co. operated the Chief No. 1, Gemini, Eureka Hill, and Plutus mines in Juab County on company and lessee account. The company operations were almost entirely in the Chief No. 1 mine, and the lessees were active in the Gemini, Eureka Hill, and Plutus mines. Although the bulk of the ore produced from the Chief No. 1 mine was zinc-lead and came from the dewatered area between the 1,800- and 2,100-foot levels, substantial quantities of siliceous ores were mined and shipped direct to Garfield. Production from the Gemini and Plutus mines was less than in 1942, but that from the Eureka Hill mine was about the same; all three properties produced crude siliceous ores, which were shipped direct to Garfield. The output of zinc-lead ores from the Chief No. 1 mine was considerably greater than in 1942, and all was shipped to the Bauer custom mill. The production in 1943 comprised 45,141 tons of zinc-lead ore, 11,000 tons of siliceous ore, and 834 tons of silver-lead ore from the Chief No. 1 mine; 4,060 tons of siliceous ore and 370 tons of silver-lead ore from the Gemini mine; 211 tons of siliceous ore from the Eureka Hill mine; and 192 tons of siliceous ore from the Plutus mine—an aggregate of 61,808 tons of ore of all classes containing 1,499 ounces of gold, 232,727 ounces of silver, 47,491 pounds of copper, 4,627,441 pounds of lead, and 6,226,241 pounds of zinc. According to the company printed annual report for the year ended December 31, 1943, development footage was increased in the lower levels of the Chief No. 1 mine over that of 1942, the most important piece of work in this regard being a drift connection on the 1,800-foot level, just completed, to an objective known as the "Gemini sink." The purpose of this drift, aside from its geological possibilities, is to carry the water to this Gemini sink, transferring it from its present course on the 1,600-foot level, thus saving a lift of some 200 feet with a compensating saving in power costs alone of approximately $2,000 per month. The company has been pumping an average of 3,300 gallons per minute continuously during 1943; the water has been lowered 250 feet from its former level and is, as of March 1, 1944, 80 feet above the 2,200-foot level. The company's objective in this operation is to dewater to its present lowest (2,500-foot) level.

The company states further that there are six ore runs making below the water level. Years ago, these were mined selectively for the lead only; however, there are sections of these runs in which even selective mining of lead was discontinued owing to the then-existing low metal prices. These latter areas are now affording the company its greatest tonnage of zinc-lead ores. In addition to the extraction of ores from these particular areas, mining will be carried on from the faces of the various ore runs as each becomes dewatered and will be followed down into virgin territory because there is no doubt that these ores continue to greater depths. The mining of zinc-lead ores from the present levels is economic only because of the premiums for zinc and lead allowed by the Government, but when mining again is taken up on the faces of the six ore runs mentioned above, from the bottom levels, it will again be possible to mine selectively and thus materially increase the grade of the ores. The beginning of selective mining will depend on the speed of the final dewatering operation, and the company has equipment on hand to increase the present pumping capacity to 5,000 gallons per minute.

The Eagle & Blue Bell, Centennial-Beck, and Victoria mines, all owned or controlled by the United States Smelting, Refining & Mining Co., were operated until August 31, when all operations stopped. The production from these properties comprised 14,026 tons of siliceous gold-silver ores, all shipped direct to smelters, principally Garfield. A total of 30,478 tons of siliceous gold-silver ore from the Mammoth mine and dump was shipped direct to Garfield. Philip P. Clark operated the Godiva mine under lease throughout 1943 and shipped 2,002 tons of high-grade silver ore and 61 tons of lead ore direct to smelters. A car of crude silver ore was shipped direct to a smelter from the Empire group in 1943; the property was operated from September through December by a lessee. The remainder of the output from the Juab County section of the Tintic district was a few tons of siliceous tailings shipped direct to smelters.

The major part of the metal output of the Utah County section of the Tintic district was contained in ores produced by the Tintic Standard Mining Co. and its subsidiary companies. The following operating details are taken in part from the company printed annual report for the year ended December 31, 1943. Ore produced by the Tintic Standard mines (including the Hannibal Unit and Iron Blossom mine) totaled 58,705 tons, or 20,193 tons less than in 1942. Reductions were noted in the output of both lead ore and siliceous ore. The number of men employed underground during 1943 was at all times less than that required to operate advantageously. The men were not available from any source, although some help was given by various Government agencies. The War Production Board changed the premium payments for lead from the Tintic Standard mine, effective August 1, 1943, eliminating the B premium payments and changing A premium payments from zero quota to 230 tons a month. The Eureka Lilly mines were operated only by lessees in 1943; production amounted to 9,387 tons of siliceous ore shipped direct to smelters, which includes 48 tons produced in course of development by the Tintic Standard-North Lily Development Unit. The Colorado Consolidated Mines Co. property was operated principally on lessee account in 1943. The No. 1 shaft on the Colorado Consolidated property was repaired, and a hoist and compressor were installed preparatory to increased mining operations. The Federal Government, through its Grazing Service, has started to construct a road that will, when completed, make it possible to connect the 300-foot level of the No. 1 shaft with the surface by a short tunnel. Production in 1943 totaled 4,651 tons of siliceous ore, all shipped direct to smelters.

Development of the area owned by the Eureka Lilly Consolidated Mining Co. and the Twentieth Century Mining Co. was continued in 1943 by the Tintic Standard Mining Co.-North Lily Mining Co. Development Unit. The Development Unit is the result of, and in accordance with, a joint development program undertaken by the Tintic Standard Mining Co. and the North Lily Mining Co. under terms of an agreement dated October 29, 1942. A vein of ore approximately 3 feet wide was found within the Twentieth Century property, and development is continuing on it. Production in 1943 amounted to 48 tons of siliceous ore from the Eureka Lilly section and 553 tons of siliceous ore from the Twentieth Century section. Development in 1943 totaled 1,412 feet of drifts, 115 feet of raises, 1,584 feet of diamond drilling, and 272 feet of long-hole drilling. Development on all other properties of the Tintic Standard Mining Co. in 1943 consisted of 2,305 feet of drifts, 241 feet of raises, 66 feet of shafts, 102 feet of diamond drilling, and 3,061 feet of long-hole drilling.

An aggregate of 73,296 tons of ore of all classes was mined in 1943 by the Tintic Standard Mining Co. and its subsidiary companies and lessees, including the Development Unit. The total metal content was 3,567 ounces of gold, 750,404 ounces of silver, 1,042,974 pounds of copper, 11,521,686 pounds of lead, and 67,557 pounds of zinc. A considerable quantity of the lead ore from the Tintic Standard mine was milled at the Tooele concentrator, making a lead concentrate and a siliceous tailing. The purpose served by milling this lead ore was to eliminate much of the silver from the lead blast-furnace charge. The American Smelting & Refining Co. continued to ship siliceous gold-silver ore from the Harold dump of the Tintic Standard Mining Co. direct to Garfield in 1943; 71,779 tons of such material were shipped. The Tintic Standard Mining Co. receives a flat price per ton of material sold from the dump. It is estimated that the dump will be virtually exhausted in about 1 year if shipments continue at the present rate. The Tintic Bullion mine owned by the International Smelting & Refining Co. was operated throughout 1943 by the North Lily Mining Co.; production included 2,073 tons of high-grade gold ore (some of which was exceptionally rich), 1,019 tons of gold-silver ore, and 2,821 tons of zinc-lead ore. Other active mines in the Utah County section of the Tintic district, owned or controlled by the International Smelting & Refining Co., included the Eureka

Bullion, May Day, and North Lily properties; production comprised 3,066 tons of gold ore, 326 tons of silver ore, 185 tons of gold-silver ore, and 202 tons of lead ore, all shipped direct to smelters.

Trout Creek district.—The Trout Creek Mining Co. shipped a car of zinc-lead ore to the Combined Metals Reduction Co. plant at Bauer in 1943.

MILLARD COUNTY

Notch Peak district (formerly Kanosh).—The Kanosh Leasing Co. operated the Blue Bell mine from May 7 to October 8, 1943. During the operating period 291 tons of oxidized zinc ore were shipped direct to the Tooele slag-fuming plant; production at the mine was limited to amounts acceptable by the smelter for use as direct feed in its slag plant.

PIUTE COUNTY

Mount Baldy district.—John Pearson, lessee, operated the Deer Trail mine in January 1943 and shipped 161 tons of gold-silver ore direct to Garfield.

Ohio district.—The Cascade Lease operated the Cascade claim throughout 1943 and shipped 46 tons of crude gold-silver ore direct to Garfield and 970 tons of zinc-lead ore to the Midvale concentrator. A test lot of gold ore was shipped direct to a smelter from the Cedar Hills property.

SALT LAKE COUNTY

Big and Little Cottonwood districts.—Crude lead and zinc-lead ore shipped direct to smelters from the Cardiff mine by lessees in 1943 comprised the bulk of the output from the Big Cottonwood district. Other producers active in 1943 included the Kentucky Utah Mining Co., Mountain Mines Co., American Metal Mining Co., and R. G. Shaw.

Silver ore and lead ore shipped direct to smelters comprised the production from the Little Cottonwood district in 1943.

Smelter district.—Production from the Smelter district in 1943 came from the Sandy smelter dump, Mingo smelter dump, and cleanings at local assay offices, railroad yards, and sampling company yards.

West Mountain (Bingham) district.—The Bingham district, by far the most important mining region in Utah, produced 88 percent of the gold, 57 percent of the silver, virtually all the copper, 54 percent of the lead, and 50 percent of the zinc output of the State in 1943. The total value of metal output in the district reached a new high and easily surpassed that of any other district in the United States. The following table shows production from mines in the district in 1942 and 1943 and the total from 1865 to 1943.

Mine production of gold, silver, copper, lead, and zinc in Bingham or West Mountain district, Salt Lake County, Utah, 1942–43, and total, 1865–1943, in terms of recovered metals

Year	Mines producing	Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1942	15	34,087,179	327,258	5,399,744	609,374,900	79,991,300	45,267,100	$98,597,468
1943	14	36,532,301	343,551	5,404,365	644,495,100	70,873,600	46,809,500	110,022,698
Total, 1865–1943	....	(1)	5,141,736	132,794,634	[2] 4,052,854	[2] 1,495,795	[2] 438,283	1,576,356,205

[1] Figures not available.

[2] Short tons.

The Utah Copper Co. exceeded its previous record production and in 1943 easily maintained its position as the leading copper producer in the world. The company produced over three-quarters of the State gold, one-third of the State silver, and virtually the entire State output of copper. Labor shortages, which hindered maximum output from most mines in Utah, did not result in any reduction in the tonnage of ore mined in the huge open-pit operation at Bingham. Ore and waste were mined at the rate of approximately 218,000 tons a day in 1943 compared with 204,000 tons in 1942. The ore was hauled to the two company concentrating units at Magna and Arthur, approximately 17.5 miles by rail from the pit. The waste rock was placed in gulches adjacent to the pit and there leached. New equipment, which pertained mostly to ore haulage, comprised two large Mallet-type steam locomotives, three Diesel-type locomotives, 100 ore cars of 100-ton capacity, and 25 forty-cubic yard dump cars for use in stripping. Ore was milled at the Magna and Arthur plants at the rate of about 97,000 tons a day in 1943 compared with 91,000 tons in 1942; the plants were shut down for two brief periods of about 48 hours in 1943 as a result of labor disputes. The average grade of the ore treated in 1943, compared with 1942, was about the same in copper and gold, slightly lower in silver, but slightly higher in molybdenite. Average mill recoveries were somewhat lower in gold and copper but slightly higher in silver. The output of molybdenum sulfide was greater than in 1942, but the average mill recoveries were lower. A new power plant was nearly completed in 1943.

The printed annual report of the Kennecott Copper Corporation for the year ended December 31, 1943, says that the central power station, after suffering combined construction delays due to difficulties in obtaining labor and in securing delivery of the necessary control and metering equipment and high-pressure piping, was finally placed in full operation at the end of February 1944. A new smelting contract, made effective with the Garfield smelter in 1943, resulted in a material gross saving in the cost of smelting. The contract is for a 10-year period.

In addition to the huge quantity of copper contained in the copper concentrates made at Magna and Arthur, the company—by leaching its waste dump—produced copper precipitates in 1943 which contained over 28,000,000 pounds of copper, a reduction of about 3,000,000 pounds compared with 1942. The precipitating plant is situated at Lead Mine, a few miles below the town of Bingham.

Owing to the vast quantities of ore treated the company was the leading copper and gold producer in the United States in 1943, second in production of molybdenum, and high among the leading silver producers.

An adit large enough to accommodate a standard railroad locomotive was started just below the town of Bingham in 1943. The adit, nearly half completed as of May 1943, will be approximately 4,400 feet long when completed and will end under the floor of the present open pit some 50 feet below the surface. The adit is to be completed in 1944 and will be used for ore haulage.

According to records received during the first 4 months of 1944, the company has cut back slightly its previous high rate of production.

The Boston Consolidated mine, owned by the Utah Copper Co., was operated all of 1943 by the American Smelting & Refining Co.

under lease agreement. Crude ore was shipped direct to the Garfield and Murray smelters and exceeded the output in 1942 by about 10,000 tons. The copper content of the ore shipped was slightly lower than in 1942.

Zinc and lead production of the Bingham district came largely from the United States & Lark property of the United States Smelting, Refining & Mining Co. Production of lead in 1943 declined more than 9,000,000 pounds, whereas that of zinc increased over 1,500,000 pounds. These fluctuations were a direct result of similar loss in lead production and of gains in zinc production at the United States & Lark property. The company mined and shipped to its Midvale concentrator about the same quantity of zinc-lead ore as in 1942; however, the gold, silver, copper, and lead content showed a decrease, but the zinc content was somewhat greater. The output of crude gold-silver and lead ores shipped direct to smelters amounted to about 22,500 tons. The mine retained its position as leading lead producer and second-largest zinc producer in the Western States. Its gold and silver output was exceeded by that of the Utah Copper Co. Development in 1943 was somewhat greater than in 1942 and comprised 19,987 feet of drifts and raises and 5,621 feet of diamond drilling completed. Other properties in the Bingham district owned or controlled by the United States Smelting, Refining & Mining Co. and active in 1943 included the Niagara, the Montana-Bingham Consolidated, and the Utah Metal. Production in 1943 comprised 13,477 tons of zinc-lead mill ore and 1,976 tons of crude ore of all classes shipped direct to smelters.

The Apex-Delaware group was operated throughout 1943 by the National Tunnel & Mines Co. The property, operated through the 5-mile Elton tunnel which starts in Tooele, produced ore of several classes. Production was substantially larger than in 1942 owing to completion of rehabilitation and clean-up work and to connection with the Utah Apex and Utah Delaware mines in Bingham. Over 152,000 tons of copper ore (all sulfide) were milled in 1943; in addition nearly 17,000 tons of zinc-lead ore were treated at the Tooele sulfide concentrator, and 55 tons of ore were sent direct to a smelter. All ore was treated at the plants of the International Smelting & Refining Co. at Tooele, only a short distance from the portal of the Elton tunnel.

The Ohio Copper Co. treated about 469,747 tons of old flotation- and gravity-mill tails, averaging about 8 pounds of copper to the ton, in its 1,500-ton flotation mill. Production amounted to 5,383 tons of copper concentrates and 257 tons of copper precipitates. The rate of production (1,305 tons per day) was considerably greater than in 1942, and operations were continuous throughout 1943 except for brief periods of shut-down caused by breakage in tailings dams. It is estimated that the tailings piles remaining at Lark will provide material for 6 more years of operation at the rate of 1,500 tons a day.

The Butterfield group, including the Queen property, was operated continuously by the Combined Metals Reduction Co. and lessees in 1943. Production was 27,319 tons of zinc-lead mill ore and 1,581 tons of siliceous ores. The mill ore was treated at the Bauer plant of the Combined Metals Reduction Co., and the siliceous ores were shipped direct to smelters.

Other producers active in the Bingham district in 1943 included the Kaign, New England, Chicago Silver, property of the Bingham Lead Co., and the Kremlin mines.

SAN JUAN COUNTY

The only production in San Juan County in 1943 was a small lot of copper ore shipped direct to a smelter from the Hope claim in the La Sal Mountains.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The Park City region includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. Mines in the Park City region produced a greater tonnage of material than in 1942; however, much of the increase in total tonnage was old tailings from Silver Creek, which were shipped under favorable premiums for lead direct to smelters for flux and also reconcentrated for zinc and lead. The production of all metals except lead decreased, as indicated in the following table which gives the output from the region in 1942 and 1943 and the total since 1870.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1942–43, and total, 1870–1943, in terms of recovered metals

Year	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1942	15	279, 748	22, 935	2, 632, 109	1, 454, 700	30, 556, 800	28, 051, 700	$7, 320, 580
1943	15	362, 950	19, 559	2, 001, 555	1, 265, 100	32, 044, 200	22, 973, 000	7, 156, 755
Total, 1870–1943		(1)	515, 879	231, 301, 798	66, 047, 313	2, 350, 547, 834	634, 077, 611	351, 356, 903

[1] Figures not available.

The total tonnage of ore mined and treated by the Silver King Coalition Mines Co. in its 800-ton flotation mill exceeded that in 1942 by 5,000 tons; however, the gold, silver, copper, and zinc content of the ore treated was substantially lower than in 1942, whereas the lead content remained about the same. Both development and production were handicapped throughout the year as a result of manpower shortages so marked as to seriously upset operational balance. The War Production Board again modified the company quota on zinc, to zero from a former quota of 125 tons; the basic lead quota remained unchanged at 150 tons. The mine and 800-ton concentrator were active 308 days in all during 1943 and treated an average of 311 tons daily. The company printed annual report for the year ended December 31, 1943, states that mining produced a total of 96,018 tons, of which 95,800 tons were milled and 218 tons shipped direct to a smelter. The 95,800 tons of zinc-lead ore milled made 9,895 tons of lead concentrates and 6,079 tons of zinc concentrates; the total metal content of the concentrates was 1,079 ounces of gold, 804,274 ounces of silver, 446,925 pounds of copper, 13,294,454 pounds of lead, and 7,603,562 pounds of zinc. The lead concentrates averaged 78.3 percent lead and were shipped to the Murray smelter; the zinc concentrates averaged 61.7 percent zinc and were shipped to the Anaconda Copper Mining Co. zinc smelter at Anaconda, Mont. The crude ore shipped direct to a smelter contained 15 ounces of gold, 12,346 ounces of silver, 4,710 pounds of copper, and 132,126 pounds of lead. Total development footage completed in 1943 was less than in 1942 and included 17,428 feet of drifts, 2,928 feet of raises, winzes, and shafts, and 155 feet of diamond drilling.

The Park Utah Consolidated Mines Co. operated the Park Utah Consolidated Mines group in Summit County and the Park Utah Consolidated Mines group in Wasatch County in 1943. The boundary line between Summit and Wasatch Counties passes over the property of the company. All the ore produced was sent to the plants of the International Smelting & Refining Co. at Tooele for further treatment. According to the company printed annual report for the year ended December 31, 1943, the production from the property for the year was 49,783 tons of ore containing 912 ounces of gold, 447,331 ounces of silver, 257,701 pounds of copper, 11,456,219 pounds of lead, and 9,324,629 pounds of zinc. The ore mined had a lower gold content, higher silver and lead content, and about the same zinc content as in 1942. The production was lower than in 1942, owing chiefly to a shortage of efficient labor and to other general operational difficulties. Early in 1943 a favorable modification in the premium allowance for metals by the Government enabled the company to undertake unwatering of the lower levels of the Ontario mine, which had been flooded for over 20 years, and to unwater the lower levels of the Eastern section of the property for the development of new zinc production.

Over 7,000 feet of tunnels and shafts were reopened, repaired, and equipped for operations. The unwatering, although an extensive project, proceeded smoothly, and the first objectives of the operation have been reached and are under production; further major development and exploration are now under way. About 5,000 gallons of water per minute are being pumped; reserve capacity is available if needed. Further favorable results should be obtained if future conditions are such that an intensive development program can be maintained. The Park City Utah Mines group (Keetley) in Wasatch County shipped 347 tons of ore of all classes to the International smelter and mill for treatment. All ore shipped in 1943 from the Daly group was mined by the Park Utah Consolidated Mines Co.; it comprised 2,142 tons of silver ore shipped direct to the International smelter. In addition, about 9,000 tons of siliceous silver ore from the Ontario and Daly dumps were shipped direct to smelters.

The New Park Mining Co. production in 1943 was the greatest yet reached by the company and resulted in its being the leading producer of gold, zinc, and copper in the Park City region. Gold-silver-copper-lead-zinc ore amounted to 65,811 tons, which contained 19,892 ounces of gold, 690,385 ounces of silver, 873,734 pounds of copper, 8,915,097 pounds of lead, and 12,083,216 pounds of zinc. All ore was shipped to the Midvale concentrator for further treatment. The company received during 1943 the original quota payments from the War Production Board under an A quota basis; premium payments in 1943 totaled $376,348. According to the company printed annual report for the year ended December 31, 1943, the policy of the company has been to keep the development well ahead of production, and at present there is blocked out enough ore to last at least 1½ years at the present rate of production. The company has retained in the mine stopes showing high gold and silver values. Further, these values have increased consistently with depth and should assure a valuable reserve for the company. The gold appears to be primary in origin and may continue to great depth. New methods of mining were introduced during 1943 to utilize to the maximum the limited manpower available, and a system of horizontal cut and fill stopes was introduced using electric scrapper hoist. This resulted in materially reducing costs in mining and conserved considerable manpower. The main workings of the company were driven to the West under ore which showed 800 feet above in the Star of Utah tunnel. Good progress was made, and the indications are very favorable for opening up an entirely new ore body several thousand feet to the West of the company's present workings. Exploratory work was also progressing on the Park Galena-Mayflower fissure to the East of the present workings. The Park-Mayflower tunnel now parallels this fissure for 8,000 feet before it enters the fissure of the Park-Galena ore body. An agreement was made with the United States Smelting, Refining & Mining Co. providing for vertical lines between the properties of the two companies. This will avoid the danger of apex suits between the companies and is particularly important because of the great depth at which the company is developing below the surface and the difficulty of knowing where fissures outcrop.

Reuben Garbett treated over 100,000 tons of old tailings in a flotation mill in Park City and produced about 600 tons of zinc middlings, which were shipped to the Midvale concentrator for further treatment.

A total of over 16,000 tons of old tailings from various claims along Silver Creek was shipped direct to smelters, principally Garfield. These tailings contained a small quantity of silver and lead and were mined only because of the premiums granted by the War Production Board. The Board concluded these tailings were one source of siliceous material available to the smelters at the lowest expenditure of manpower.

Other production in the Park City region in 1943 included silver ore from the Quincy mine and zinc-lead ore from the Park City Unit and American Flag mines.

TOOELE COUNTY

Tooele County in 1943 again ranked fourth among the metal-producing areas in Utah. Mines in the county produced gold, silver, copper, lead, and zinc valued at $3,243,258 compared with $3,179,414 in 1942.

Camp Floyd district.—Siliceous gold and gold-silver ores, all shipped direct to Garfield, from the Geyser Marion, Brickyard, and Sacramento mines comprised the output from the Camp Floyd district in 1943. The Brickyard mine was closed in April 1943, but the other two properties were active throughout the year. The War Production Board granted exception to its L-208 order in the case of these properties, as they are one of the two chief sources in Utah of ores with a high silica content.

Clifton district.—Some silver ore was shipped direct to a smelter in 1943 from the Western Utah Copper property.

Dugway district.—Some zinc-lead ore was shipped to the Bauer and International concentrators in 1943 from the Smelter Canyon mine.

Free Coinage district.—A test lot of zinc-lead ore was shipped direct to a smelter in 1943 from the Lead Queen mine.

Lakeside district.—Lead ore shipped direct to a smelter from the Monarch mines and silver ore concentrated from the Georgia Lyn mine comprised the output from the Lakeside district in 1943.

North Tintic district.—A car of zinc-lead ore from the New Bullion mine was shipped direct to the International lead smelter in 1943.

Ophir district.—The Hidden Treasure mine, operated throughout 1943 by the United States Smelting, Refining & Mining Co., was the largest producer in the Ophir district; it produced 7,629 tons of ore of all classes, a gain of over 1,100 tons compared with 1942. The Ophir Development Co. operated its Ophir Hill mine all of 1943, producing 987 tons of zinc-lead ore and 1,354 tons of silver ore. Among other properties active in 1943 were the Shoo Fly, Togo claim, Wandering Jew, and Mono group.

Rush Valley district.—Production from the Rush Valley district in 1943, as in former years, came mostly from the West Calumet (Calumet) mine owned and operated by the Combined Metals Reduction Co. The mine produced, on both company and lessee accounts, 38,881 tons of zinc-lead ore milled at the Bauer plant and 213 tons of crude lead ore shipped direct to a smelter. A total of 1,826 tons of ore of all classes was shipped direct to smelters from the Honerine-Galena King mine. Other production in 1943 came chiefly from the Bluestone and Silver Eagle mines.

Smelter district.—The second-largest source of zinc production in Utah in 1943 was zinc slag fumed at the International Smelting & Refining Co. plant at Tooele. The plant was operated continuously in 1943 and treated a total of 140,165 tons of cold slag, hot slag, and crude ore and produced a greater quantity of zinc and lead than in any previous year of operation. Although the plant treated 140,165 tons of material, only 109,042 tons of this total and the zinc and lead contained are credited to Utah; the remainder is slag derived from the smelting of ores and concentrates from mines in other States and is therefore credited to those States. Recovery of zinc at the slag-fuming plant was somewhat higher than in 1942 because the lead recovery at the lead blast furnace was exceptionally high owing to the fact that the lead blast furnace and slag-fuming plant are in closed circuit. The zinc fume produced averaged 72 percent zinc and the lead fume 47 percent lead.

Willow Springs district.—The Oro Del Rey mine, only active producer in the Willow Springs district in 1943, shipped 284 tons of rich gold-silver-lead ore direct to smelters. The property was operated by the owners and lessees.

UTAH COUNTY

American Fork district.—The Howell Mining Co. operated the Globe mine from March through December and the Live Yankee mine intermittently in 1943. A total of 109 tons of gold-silver ore was shipped direct to smelters and 267 tons of zinc-lead ore to custom mills. Most of the remaining production was zinc-lead ore from the Silver Dipper mine.

Tintic district.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

Tutsagubet district.—The Apex Mining Co. operated its Apex mine from January to April 30, 1943, and shipped copper ore direct to Garfield.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN WASHINGTON

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

	Page		Page
Summary	483	Metallurgic industry	488
Calculation of value of metal production	484	Review by counties and districts	491
Mine production by counties	486	Chelan Lake district	491
Mining industry	487	Republic district	492
Ore classification	488	Metaline district	493

SUMMARY

Washington mines yielded gold, silver, copper, lead, and zinc valued, in terms of recoverable metals, at $7,838,012 in 1943 compared with $8,172,609 in 1942; the output of silver and lead showed slight gains, whereas the output of each of the other metals decreased. The average prices paid for copper, lead, and zinc were considerably higher than in 1942, which tended to maintain a total value of metal output about equivalent to that in 1942. The decrease in gold output in 1943 was caused by the closing of nearly all the gold mines in the State. As in former years, copper was derived almost entirely from the Holden property of the Howe Sound Co. in Chelan County; although the tonnage of ore treated was greater than in 1942, it had a lower copper, gold, silver, and zinc content. The decreased production of zinc and the gain in output of lead was the net result of the treatment of a smaller tonnage of zinc-lead ore in Pend Oreille County, having a lower zinc but a higher lead content than in 1942. The Pend Oreille Mines & Metals Co. was again the leading producer of both lead and zinc in the State.

Shortages of labor prevailed throughout the principal copper-, lead-, and zinc-producing areas and were particularly acute during the summer months. The Army again furloughed about 100 soldiers to the copper property in Chelan County and the zinc-lead mines in Pend Oreille County.

The War Production Board took steps during the last quarter of 1943 to curtail the development of copper, lead, and zinc mines. The main features of the action, effective October 27, were that premiums in the B range for lead and the B and C ranges for zinc were denied to lead or zinc mines not already operating and to lead and zinc mines having a low rate of productivity and in areas in which there is a serious labor shortage. The Government will not finance new zinc projects. Effective November 9, the Board stated that no more applications for the special copper premium price would be received after December 31, 1943. These actions were prompted by increased mineral production, success in balancing supplies with requirements of the armed services and the most essential civilian needs, and a greater need for marginal manpower than marginal production.

The Geological Survey and the Bureau of Mines were active in promoting the availability of mineral production from several properties in Washington. The services rendered comprised engineering assistance to operators, as well as the performance of actual development work by core drilling and other mining methods. Large tonnages of ore were developed and reserves proved through the joint work of the Bureau of Mines, the Geological Survey, and the mining companies.

The Department of Agriculture, operating through its Forest Service, rendered much service to various base-metal mines in the State by building access roads.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold[1]	Silver[2]	Copper[3]	Lead[3]	Zinc[3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787. [5] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1939–43, and total, 1860–1943, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1939	88	84	1,124,564	90,420	$3,164,700	442,063	$300,067
1940	83	88	1,166,798	82,136	2,874,760	365,175	259,680
1941	61	56	1,238,509	84,176	2,946,160	402,030	285,888
1942	37	18	1,222,937	75,396	2,638,860	369,038	262,427
1943	24	2	1,131,281	65,244	2,283,540	370,440	263,424
1860–1943			(1)	2,022,365	49,538,098	11,962,368	8,466,998

Year	Copper		Lead		Zinc		Total value

[1] 1860–1903: Figures not available; 1904–43: 9,518,491 tons produced.

[2] Short tons.

Gold and silver produced at placer mines in Washington, 1939–43, in terms of recovered metals

Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value	
1939	2,261	$79,135	358	$243	$79,378
1940	2,747	96,145	720	512	96,657
1941	540	18,900	90	64	18,964
1942	356	12,460	59	42	12,502
1943	116	4,060	17	12	4,072

Gold.—The output of recoverable gold from lode and placer operations in Washington in 1943 was 65,244 fine ounces, a 13-percent decrease from the output in 1942. Nearly all the gold-producing mines in the State had closed by midyear 1943; those remaining open had received special dispensation from the War Production Board because of their importance as flux producers or peculiar conditions of operation. This, in addition to the lowering in gold content of the ores treated by the Howe Sound Co., caused the decline in gold production in the State. The Holden property of the Howe Sound Co., which yielded gold as a byproduct of the production of copper and zinc, was again the largest gold producer in the State and supplied about 64 percent of the State total; it was followed by Knob Hill Mines, Inc., which treated gold ore from its Knob Hill mine in Ferry County throughout 1943 by cyanidation and concentration. These two properties furnished over 96 percent of the State total output. Other gold-producing properties included the Aurum and Valley mines, both in the Republic district, Ferry County. The total output of gold ore was 61,002 tons in 1943, compared with 93,957 tons in 1942; it was treated as follows: 51,135 tons in a cyanidation-concentration mill and 9,867 tons shipped crude to smelters. Placers yielded 116 ounces of gold.

Silver.—The output of recoverable silver in Washington was slightly greater in 1943 than in 1942; gains in output from mines in Ferry, Okanogan, and Whatcom Counties more than offset losses in other silver-producing counties. The principal production came from mines in Ferry, Chelan, Okanogan, and Stevens Counties; mines in Ferry and Chelan Counties produced 85 percent of the State total. Gold ore yielded 47 percent of the total silver; zinc-copper ore, 38 percent; zinc-lead ore, 11; and zinc, lead, copper, silver, and gold-silver ores, and placers, the remainder. The Knob Hill property of Knob Hill Mines, Inc., in Ferry County was the largest silver producer in the State; it was followed by the Holden property of the Howe Sound Co. in Chelan County and the Kaaba property of the Kaaba-Texas Co. in Okanogan County; these three properties furnished 91 percent of the State total silver. Other producers of silver were the Aurum property in Ferry County, the Sierra Zinc Co. property in Stevens County, and the Pend Oreille Mines & Metals Co. property in Pend Oreille County. A placer mine yielded the 17 fine ounces of silver.

Copper.—The output of recoverable copper in Washington in 1943 was less than in any year since 1938 and 9 percent less than in 1942. Almost all (99 percent) of the State total copper was recovered from the zinc-copper ores of the Holden property of the Howe Sound Co. The company shipped copper concentrates rich in gold to the Tacoma smelter for treatment. The value of the gold content of the copper concentrates was equivalent to 78 percent of the value of the copper. Following the Howe Sound Co. as copper producers were the Sunset mine of the Kromona Mines Corporation in Snohomish County, the Kaaba property of the Kaaba-Texas Co. in Okanogan County, and the Lucky Boy mine in Stevens County.

Lead and zinc.—The production of recoverable zinc in Washington in 1943 declined 4,390,000 pounds (15 percent) compared with 1942, but the output of recoverable lead reached a new high, exceeding that in any year of the State's history. Mines in Pend Oreille County—by far the most important source of zinc and lead in the State—produced a slightly greater quantity of lead than in 1942 but showed a decrease of nearly one-third in zinc production. Shortages of labor and power, as well as a change in grade of ore, were factors contributing to the loss in zinc output; change in grade of ore treated resulted in the increase in lead output. The Howe Sound Co. recovered zinc from its zinc-copper ore and ranked third as a source of this metal in 1943. Most of the remaining lead and zinc output was recovered from mines in Stevens County. Zinc-lead ore treated in 1943 in the two flotation mills (Pend Oreille and Grandview) in Pend Oreille County decreased 86,381 tons from that treated in 1942. It averaged 1.70 percent in lead and 3.80 percent in zinc compared with 1.50 percent in lead and 4.70 percent in zinc in 1942. Zinc and zinc-lead ores treated in Stevens County totaled 21,112 tons in 1943 compared with 14,064 tons of zinc-lead ore in 1942. The average grade of the ore was higher than that treated from mines in Pend Oreille County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1943, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Asotin		1	2	$70		
Benton		1	114	3,990	17	$12

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

Seven properties in Washington produced 1,116,783 tons of ore in 1943—99 percent of the State total. This output included zinc-copper ore from the Holden mine in Chelan County; zinc-lead ore from the Pend Oreille, Metaline, and Grandview mines in Pend Oreille County and the Kaaba-Texas property in Okanogan County; zinc ore from the Blue Ridge property in Stevens County; and gold ore from the Knob Hill property in Ferry County. Development completed on company account in these seven properties in 1943 included 16,941 feet of drifts, raises, shafts, and tunnels and 47,774 feet of diamond drilling. Aside from development and exploration on company account, the Government through its various agencies, particularly the Bureau of Mines, completed several thousand feet of diamond drilling.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Washington in 1943, with content in terms of recovered metals

Source	Mines producing[1]	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	7	61,002	22,927	173,115	12,000		
Dry and siliceous gold-silver ore	2	74	2	146	400		
Dry and siliceous silver ore	2	144	1	753	350	2,900	
Copper ore	2	2,339	11	1,119	123,700		
Lead ore	4	374		1,859		211,692	
Zinc ore	1	19,412	263	9,150	17,550	250,200	1,828,000
Zinc-copper ore	1	720,560	41,920	141,930	14,437,000	12,000	3,860,000
Zinc-lead ore	5	327,376	4	42,351	39,000	9,567,208	18,718,000
Total, lode mines	24	1,131,281	65,128	370,423	14,630,000	10,044,000	24,406,000
Total, placers	2		116	17			
	26	1,131,281	65,244	370,440	14,630,000	10,044,000	24,406,000
Total, 1942	55	1,222,937	[2]75,396	[2] 369,038	16,060,000	9,702,000	28,796,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 940 ounces of gold and 2,557 ounces of silver from current tailings cyanided.

METALLURGIC INDUSTRY

Lode mines in Washington produced 1,131,281 tons of ore in 1943, which was treated as follows: 51,135 tons in a cyanidation-concentration mill, 1,069,745 tons in concentrating mills, and 10,401 tons shipped crude to smelters.

Cyanidation mills.—The cyanidation-concentration mill of Knob Hill Mines, Inc., was the only plant of this type active in 1943. It treated a total of 51,135 tons of gold ore and consumed 69,700 pounds of calcium cyanide, 8,580 pounds of zinc dust, and 489,400 pounds of lime; the operation was continuous throughout 1943.

Concentration mills.—Nine concentration mills treated a total of 1,069,745 tons of ore, as follows: One plant 720,560 tons of zinc-copper ore, four plants 327,376 tons of zinc-lead ore, one plant 19,412 tons of zinc ore, and three plants a total of 2,397 tons of copper and silver ores.

Details of the treatment of all ore produced in Washington in 1943 are given in the following tables.

Mine production of metals in Washington in 1943, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore cyanided	47,004	2,083	10,770			
Concentrates smelted	66,465	60,944	347,432	14,598,181	9,830,308	24,406,000
Ore smelted	10,401	2,101	12,221	31,819	213,692	
Placer		116	17			
		65,244	370,440	14,630,000	10,044,000	24,406,000
Total, 1942		[1] 75,396	[1] 369,038	16,060,000	9,702,000	28,796,000

[1] Includes 264 ounces of gold and 87 ounces of silver recovered in amalgamation bullion; no amalgamation in 1943.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Washington in 1943, by types of mills and by counties, in terms of recovered metals

CYANIDATION MILLS

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal		
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)
Ferry	51,135	2,083	10,770	4,153	18,749	152,830
Grand total: 1943	51,135	2,083	10,770	4,153	18,749	152,830
1942	[1] 71,357	[2] 4,207	[2] 18,178	3,506	17,757	125,094

[1] Also 180,000 tons of current tailings (from copper ore concentrated in Chelan County) were cyanided.

[2] Includes 264 ounces of gold and 87 ounces of silver recovered in amalgamation bullion; no amalgamation in 1943.

Mine production of metals from concentrating mills in Washington in 1943, by counties, in terms of recovered metal

BENTON COUNTY

The gold output from Benton County in 1943 came from a dry-land dredge operating on the Columbia River.

CHELAN COUNTY

Chelan Lake district.—The Holden mine of the Howe Sound Co. was the leading producer of gold and copper, second in silver, and third in zinc in Washington in 1943. The company treated 720,560 tons of zinc-copper-gold-silver ore, which averaged 0.075 ounce of gold and 0.27 ounce of silver to the ton, 1.09 percent copper, and 0.62 percent zinc. Although the company treated 4,834 tons more ore than in 1942, the metal content, particularly the copper, was lower, resulting in decreased copper production for the State. The smaller gold content aided materially in lowering the State total gold output. In 1942 the company added equipment to its 2,000-ton flotation concentrator and took other steps necessary to effect recovery of zinc from its zinc-copper ore. Zinc concentrates were first shipped in January 1943. The Howe Sound Co. states in its printed annual report, dated December 31, 1943, that at the Chelan Division the shortage of labor continued throughout 1943. It became necessary, as in 1942, for the Army to release men for work in the base-metal mines. The Holden property received its proportional quota; but, in spite of the help, the number of underground employees at the close of the year was materially less than on January 1, 1943. Because of this situation it was impossible to carry on the required amount of development and exploration; and a shaft, which is being sunk below the main haulage adit, could not be completed. Ore reserves developed in prior years cannot be made available for milling until this shaft is completed. Although the plant was operated at full capacity throughout the year with only minor delays, a substantial portion of the ore produced was broken in low-grade areas. To maintain production of copper for the war program, the War Production Board granted price consideration for this material, which otherwise could not have been handled. At the end of the year the ore-reserve situation was excellent, but until the main hoisting shaft is completed the principal source of production will be the low-grade ore bodies mentioned. Total footage of development completed in 1943 was equivalent to about one-half that completed in 1942 and included the completion of 267 feet of shaft, 8,650 feet of drifts and raises, and 6,455 feet of diamond drilling.

FERRY COUNTY

Danville district.—The Morning Star Mining Co. operated its gold-copper property from January to September 15, 1943, and shipped 272 tons of gold-copper ore crude to Tacoma.

Republic district.—Mines in the Republic district were the chief source of siliceous ores in Washington in 1943. They produced 60,730 tons, of which 51,135 were treated by cyanidation-concentration and 9,595 shipped crude to the Tacoma smelter. Knob Hill Mines, Inc., operated throughout 1943, treated 51,135 tons of ore from its Knob Hill mine in its 400-ton cyanidation-concentration mill. The mill produced 4,153 tons of gold concentrates, which were shipped to Tacoma for smelting; the gold bullion was shipped to the Seattle Assay Office. The ore treated in 1943 had a higher gold and silver content than in 1942; in consequence, the Knob Hill mine became the leading silver producer and the second-largest gold producer in the State. The company stated that all production in 1943 came from underground mining. Development in 1943 amounted to completion of 1,100 feet of drifts.

The Aurum Mining Co. property was operated by lessees in 1943; production was considerably smaller than in previous years, but the property remained the chief source in Washington of siliceous ores shipped crude to a smelter. The Valley mine and dump produced 1,302 tons of highly siliceous gold ore, which was shipped direct to the Tacoma smelter. Other production in the district included crude ore shipped direct to a smelter from the South Penn and Mountain Lion properties.

OKANOGAN COUNTY

Conconully district.—The Conconully district in 1943 produced ore, which was shipped crude to smelters from the Lone Star and Silver Star properties.

Loomis-Oroville district.—The Kaaba-Texas Mining Co. operated its 150-ton flotation mill intermittently in 1943 and treated 14,431 tons of zinc-copper-lead-gold ore. The ore treated was quite low grade (averaging 2.4 ounces of silver to the ton, 0.3 percent copper, 1.4 percent lead, and 1.0 percent zinc), and the company could not maintain steady mill runs until October 1943 owing to machinery trouble and lack of manpower; mill recoveries during the year were high. The average daily tonnage of ore treated during the last quarter of 1943 was 105 tons. The mine is developed through a

390-foot shaft, from which about 2,000 feet of drifts have been driven. The Bureau of Mines examined the property in 1943 and by sampling indicated the presence of approximately 40,000 tons of ore of about the same metal content as shown above. Recommendations were made that if carried out would explore certain areas of the mine that show promise of containing higher-grade ore.

PEND OREILLE COUNTY

Metaline district.—Mines in the Metaline district continued to supply the major portion of the lead and zinc output in the State. The value of the recoverable metal was $2,699,363 in 1943 compared with $3,150,270 in 1942. The decrease was the combined result of labor shortages, power shortages, and lowering of the zinc content of the ores treated.

An extensive drilling campaign was started in 1943 by the Bureau of Mines, working through its Western Regional Office at Salt Lake City, Utah, on the mineral-bearing areas controlled by the Pend Oreille Mines & Metals Co. and the American Zinc, Lead & Smelting Co. From the time the program was begun in January 1943 up to February 1944 a total of 17,332 feet of hole had been drilled. Of this total, 5,905 feet were drilled on the Metaline Mining & Leasing Co. ground (controlled by the American Zinc, Lead & Smelting Co.) and the rest on Pend Oreille Mines & Metals Co. ground. As of February 1, 1944, it is estimated that Bureau of Mines diamond drilling has indicated approximately 9,000,000 tons of about 5 to 7 percent combined metals in zinc-lead ore. Additional reserves totaling about 3,000,000 tons have been outlined over a period of years by the principal operating companies in the district. The Bureau of Mines made certain recommendations calculated to increase the output of zinc and lead in the district.

The Pend Oreille Mines & Metals Co. was again the leading producer of zinc and lead in the district. The company operated its property throughout 1943 and treated daily an average of 504 tons of ore in its 700-ton concentration mill. On account of a labor shortage at the mine during 1943 and a shortage of electric power that developed in the latter part of March and continued throughout April, the tonnage of ore mined dropped approximately 13 percent from 1942. The lead concentrates produced averaged about 78 percent and the zinc concentrates 61 percent. The average grade of the ore treated in 1943 was 1.41 percent lead and 3.34 percent zinc compared with 1.66 percent lead and 4.28 percent zinc in 1942. The printed annual report of the Pend Oreille Mines & Metals Co., dated for the fiscal year ended April 30, 1943, states:

> Every effort was made to maintain output at the highest possible level but at the expense of underground development work, which, on account of the labor shortage, was necessarily curtailed. As soon as men are made available, our development work will be greatly accelerated in view of increasing operations.

According to the company report for the calendar year 1943, mine development amounted to completion of 3,302 feet of shafts, raises, and tunnels and 24,669 feet of diamond drilling.

The rest of the production of the district came from the Grandview mine of the American Zinc, Lead & Smelting Co. and the property of the Metaline Mining & Leasing Co., both operated by the American

Zinc, Lead & Smelting Co. The Grandview mine produced 81,881 tons of milling ore, which was concentrated into 7,885 tons of zinc and lead concentrates. Because of a power shortage, production from the mine was very small during March, April, and May. The printed annual report of the American Zinc, Lead & Smelting Co., dated December 31, 1943, states:

> Development work consisted of 2,922 feet of drifts and raises, 5,510 feet of surface diamond drilling, and 10,840 feet of underground drilling. Development was expanded during the year up to the limit of available manpower, which permitted increased production rate for the last half of the year. At the end of the year, the developed condition of the mine was much improved and satisfactory for the maintenance of the current expanded production rate. Surface diamond-drill prospecting ahead of the underground development has indicated further ore extensions. Our present underground development program contemplates making these ores available for mining the latter part of 1944.

The property of the Metaline Mining & Leasing Co., operated by the American Zinc, Lead & Smelting Co., produced 46,322 tons of zinc-lead ore, which was concentrated into 3,883 tons of zinc and lead concentrates. The output from this property was curtailed in April because of a power shortage. When enough power was made available, the production rate again reached normalcy consistent with the availability of manpower. Development on the property was expanded during the year to the limit of available manpower.

SNOHOMISH COUNTY

Index district.—The only active producer in the Index district in 1943 was the Kromona Mines Corporation. The output in 1943 was substantially the same as in 1942 and included crude copper ore shipped direct to the Tacoma smelter.

STEVENS COUNTY

Bossburg district.—Russell Parker operated the Bonanza mine throughout 1943 and shipped 232 tons of silver-lead ore crude to the Bunker Hill smelter. The ore averaged 4.5 ounces of silver to the ton and 22 percent lead.

Deer Trail district.—The production from the Deer Trail district in 1943 comprised zinc-lead ore milled from the Cleveland mine and crude lead ore shipped direct to a smelter from the Deer Trail mine.

Northport district.—The Sierra Zinc Co. operated its Blue Ridge property throughout 1943 and was the largest producer in the district. The company treated 19,412 tons of zinc ore in its 90-ton flotation mill. The lead concentrates produced averaged 66 percent lead and the zinc concentrates about 55 percent zinc. The ore milled during 1943 averaged about 0.35 ounce of silver to the ton, less than 1 percent lead, and slightly over 6 percent zinc. Development during the year included the completion of 700 feet of raises and tunnels and 300 feet of diamond drilling. During 1943 the Bureau of Mines, working through its Western Regional Office in Salt Lake City, Utah, examined the property. It was determined that present ore reserves show approximately 23,000 tons of measured and indicated ore containing about 11 percent zinc and 2 percent lead. Surface outcrops of ore indicate an expectancy of several times this tonnage. Based upon this examination, the Bureau began a diamond-drilling campaign in 1944 to explore adequately the possible extension of surface ore indications.

Other production in the Northport district included lead ore, from the Electric Point and Gladstone Mountain mines, that was shipped crude to a smelter, and silver ore, from the Frisco-Standard mine, that was milled to produce lead-copper concentrates.

Springdale district.—Copper ore from the Lucky Boy mine treated in the Deer Trail flotation mill comprised the only output in the Springdale district in 1943. The copper concentrates produced were shipped to Tacoma.

WHATCOM COUNTY

Mount Baker district.—Gold-silver ore was shipped crude to a smelter from the Silver Tip mine in 1943.

GOLD, SILVER, COPPER, AND LEAD IN WYOMING

(MINE REPORT)

By CHAS. W. HENDERSON AND R. V. CUSHMAN

SUMMARY OUTLINE

Page
Summary 196
Calculation of value of metal production 496

SUMMARY

There was no production from either lode or placer mines in Wyoming in 1943.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1939–43

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1939	$35.00	[4] $0.678+	$0.104	$0.047	$0.052
1940	35.00	[5] .711+	.113	.050	.063
1941	35.00	[5] .711+	.118	.057	.075
1942	35.00	[5] .711+	.121	.067	.093
1943	35.00	[5] .711+	.130	.075	.108

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver.

[3] 1939–41: Yearly average weighted price of all grades of primary metal sold by producers; 1942–43: Price includes bonus payments by Metals Reserve Co. for overquota production.

[4] $0.67878787.

[5] $0.71111111.

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1939 to 1943; it also gives the total production of metals from 1867 to 1943. About three-fourths of the total recorded value of the four metals is in copper, most of which was mined before 1924 in the Encampment district, in Carbon County, and the Hartville district, originally in Laramie County, now in Platte County.

Mine production of gold, silver, copper, and lead in Wyoming, 1939–43, and total, 1867–1943, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1939	57	583	$20,405	75	$51					$20,456
1940	813	740	25,000	114	81	4,000	$452			26,433

GENERAL SUMMARY

The recovery of nonferrous secondary metals from purchased scrap in 1943 was increased by record-breaking quantities of industrial scrap emanating from the manufacture of war equipment. The flow of segregated metal clippings and turnings from factories back to wrought-alloy producers and ingot makers was maintained in a never-ending stream, with such dispatch that corrosion and contamination were held to a minimum, and an unusual proportion of the new scrap generated was suitable for blending with primary metal in alloys produced to standard specifications. Toward the end of 1943, when the supply of nonferrous metals caught up with requirements, a few types of scrap, such as leaded-brass rod turnings and mixed aluminum, started to pile up enough to cause some concern as to their disposal, but this problem did not become serious.

Sources of old scrap were depleted, and collection drives held in various parts of the country had little success; but the quantity of obsolete and worn-out metal objects unearthed by scrap-metal dealers was nevertheless more than had been expected, particularly in view of a severe labor shortage brought about by the drain to both the armed services and higher-paid industries.

Salient statistics of nonferrous secondary metals recovered in the United States, 1942–43

Metal	New scrap		Old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1942						
Aluminum	154, 831	$45. 272. 585	[1] 41, 633	[1] $12, 173, 489	[1] 196, 464	[1] $57, 446, 074

[1] Revised figures.

---

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Although the value of metals recovered in 1943 from old scrap alone was $197,045,568, slightly more than in the year before, the value of metals reclaimed from new scrap rose to $310,770,206 compared with $229,126,659 in 1942, raising the total value of secondary metals to $507,815,774 in 1943 in contrast with $425,398,488 in 1942.

Remelters and smelters of aluminum, copper, and brass scrap expanded to virtually full capacity, and a number of the smaller concerns were able to grow enough to entrench themselves as recognized competitors to older firms; but there was little opportunity for newcomers to enter the field of secondary smelting in 1943, not only because it was difficult to find building materials and equipment, but also because Government war agencies were loath to approve new installations when existing plants had sufficient capacity to carry the load.

Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1939–43, in short tons

	1939	1940	1941	1942	1943
Aluminum	53, 947	80, 362	106, 857	196, 464	313, 961
Antimony	9, 810	11, 421	21, 629	18, 200	15, 483
Copper	499, 700	532, 046	726, 396	927, 755	1, 085, 317
Lead	241, 500	260, 346	397, 416	323, 001	341, 243

Tin	29, 160	33, 222	42, 033	37, 918	37, 820
Zinc	189, 640	222, 013	283, 967	330, 526	368, 488

[1] Data not available.

The technology of smelting secondary metals made notable advances during both 1942 and 1943. The composition of nonferrous alloys made from scrap was controlled by chemical analysis and physical testing to a degree never before attained, and the care exercised in the makeup of scrap melts to avoid contamination of the resulting product showed great improvement. Realloyed aluminum ingot made entirely from scrap met a number of specifications formerly requiring primary metal, and when the supply of zinc ore could not fill the raw material needs at primary zinc smelters, zinc-bearing flue dust was consumed in increasing quantities for production of distilled metal. Another development was the widespread practice of smelting low-grade copper, brass, and bronze scrap in cupolas to produce a stock alloy that could be used as a base to make soft red brass or composition ingot.

Scrap and secondary metals were rigidly controlled to prevent their use in nonessentials, and despite the thousands of concerns engaged in buying and selling or remelting and smelting scrap metals, prices were kept well under restraint.

The American Institute of Mining and Metallurgical Engineers at its annual convention in New York in February 1943 devoted an entire day to a Secondary Metals Symposium. Papers presented were printed in Metals Technology—American Institute of Mining and Metallurgical Engineers, volume 10, No. 7, October 1943, as follows:

Problems of the Producer in Segregation and Reclamation, by F. E. Bliven.

Mechanics of Secondary Metals Collection, by Ray Schmidt.

Problems of the Consumer of Scrap in Segregation and Reclamation, by L. S. Deitz, Jr.

Specifications and Conservation, by C. S. Cole.
Available Brass and Bronze Ingots for Implements of War, by W. Romanoff.
Recovery of Copper from Clad Steel Scrap, by G. L. Craig.
Metallurgy of Secondary Tin and Lead, by G. E. Behr.
Scrap Metals from Ordnance, by L. S. Thomas.
Secondary Aluminum in War Production, by J. J. Bowman.
Secondary Magnesium, by C. E. Nelson.
Wartime Changes in the Secondary Metals Industry, by F. H. Wright.

Other articles of interest were published early in 1944:

Kempf, L. W., Considerations Regarding the Post-war Utilization of Aluminum and Magnesium: Am. Metal Market, vol. 51, No. 10, January 14, 1944.

Korn, A., The Aluminum Scrap Market and Post-war Secondary Industry: Am. Metal Market, vol. 51, No. 108, June 3, 1944.

POST-WAR PROSPECTS

Numerous suggestions were advanced both from industrial and Government sources during 1943 for disposal of semifabricated metal parts and scrap left in manufacturing plants as war contracts ended. Uncut metal stock and semifabricated parts left over from a few plants that had already ceased operations were redistributed to other manufacturers, and clean-up scrap was readily absorbed, but the expectation of a major cut in production at the end of the war in Europe posed serious problems for the future, particularly in aluminum and brass.

Because new industrial scrap was not allowed to accumulate to any great extent during full-scale war production, disposal of the remainder when production ceased might not be difficult, but if several hundred thousand tons of semifabricated aluminum and brass were to be thrown on the scrap market all at once, the effect would be disastrous. This problem will be aggravated further by the availability, in unprecedented quantities, of old scrap from battle fronts and surplus or obsolete matériel. Estimates ranging from 250,000 to 500,000 tons of aluminum and from 750,000 to 1,000,000 tons of copper (mostly in brass) have been suggested as the quantities that might be expected to be reclaimed annually from old scrap for 4 or 5 years following the end of the war, provided industry could absorb that much. Although the zinc contained in brass might be sufficient to curtail drastically the refined-zinc requirements for post-war brass production, other war uses of zinc for smoke screens and galvanizing dissipated the metal, and no unusual return of zinc-base scrap could be expected. The outlook for lead promised enlarged supplies of old scrap in post-war years, owing to the increased consumption of both domestic and imported metal.

It was proposed that the Government retain title to both scrap and semifabricated metals already in its possession and either release them gradually as needed for civilian production or have them converted by secondary smelters and refiners into ingots, bars, and billets for stock piling, but no legislation toward this end was enacted either in 1943 or the first half of 1944.

SCOPE OF REPORT

Statistics on scrap and secondary metal for 1943 were derived from a variety of surveys covering all known dealers and consumers of purchased nonferrous scrap metals. Reports were received upon a monthly or annual basis from 375 plants classed as remelters, smelters, or refiners; from 1,030 plants classed as rolling mills, foundries, chemical works, or other manufacturers; and from approximately 4,500 dealers in nonferrous scrap metal. The major parts of the secondary lead and zinc industries and the entire scrap-dealer trade were canvassed monthly by the Bureau of Mines, but figures for consumption of aluminum scrap and ingot production by makers of aluminum ingot, as well as the detailed break-down of copper alloys produced by makers of brass ingot, were obtained from monthly surveys conducted by the War Production Board. All other figures in this report were derived from annual surveys conducted by the Bureau of Mines.

"Secondary metals" are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of metal and has no relation to the type of product recovered, either as to degree of purity or impurity or physical characteristics.

"Purchased scrap" means all scrap that entered the gates of any plant in scrap form and includes scrap treated for customers upon a toll basis or conversion agreement and interplant transfers of scrap.

"Interplant transfers" are those made between separate plants owned or operated by the same parent company but not located on the same ground. A transfer of scrap from a machine shop to a foundry at the same plant location is not an interplant transfer, and such "home scrap" is not included in this report.

"New scrap" is defined as the refuse produced during the manufacture of articles for ultimate consumption, including all defective finished or semifinished articles that must be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slag.

"Old scrap" is defined as scrap consisting of metal articles that have been discarded after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired cartridge cases, automobile crankcases, used pipe, and lithographers' plates.

SECONDARY ALUMINUM [2]

The recovery of aluminum from scrap in 1943 was far greater than ever before, totaling 313,961 short tons valued at $90,546,352 compared with 196,464 tons (revised) valued at $57,446,074 in 1942. The 1943 total was almost six times the quantity recovered in 1939, a typical prewar year, with the difference attributed entirely to new industrial scrap from war production. Values were computed upon the basis of the replacement value of primary aluminum at 14.42 cents a pound in 1943 and 14.62 cents a pound in 1942.

---

[2] The term "secondary aluminum" is used broadly to cover aluminum and aluminum alloys, including the weight of alloy constituents, such as copper, silicon, magnesium, and others.

Secondary aluminum [1] recovered in the United States, 1942–43, in short tons

Secondary aluminum recovered			Recoverable aluminum-alloy content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As metal	14,104	5,926	New scrap:		
Aluminum alloys	178,951	305,357	Aluminum-base [2]	154,436	280,065
In brass and bronze	1,268	1,279	Copper-base	297	724
In zinc-base alloys	473	219	Zinc-base	98	78
In chemical compounds	1,668	1,180			
				154,831	280,867
	196,464	313,961			
			Old scrap:		
			Aluminum-base [3]	[4] 41,221	32,414
			Copper-base	213	540
			Zinc-base	199	140
				[4] 41,633	33,094
				[4] 196,464	313,961

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Aluminum content of new aluminum-base scrap was 143,633 tons in 1942 and 261,282 tons in 1943.
[3] Aluminum content of old aluminum-base scrap was 38,144 tons in 1942 and 29,714 tons in 1943.
[4] Revised figures.

Production [3] of realloyed (secondary) aluminum ingot rose from 83,933 short tons in 1941 to 144,694 tons in 1942, then to 196,373 tons in 1943, and output of wrought aluminum from purchased scrap at the plants of primary producers and other rolling mills went up from 14,221 tons in 1941 to 53,080 tons in 1942, then to 121,827 tons in 1943. This increased use of purchased scrap in wrought-aluminum products represented a triumph for the fabricators responsible for maintaining segregation of each type of scrap from the moment of generation at the machine until delivery to a remelter.

Production of secondary aluminum and aluminum-alloy products in the United States, 1941–43, gross weight, short tons

	1941	1942	1943
Secondary-aluminum ingot: [1]			
Pure aluminum (98.5 percent)	3,449	2,924	715
95.5 (silicon)	4,014	2,896	471
Other aluminum-silicon alloys	3,356	10,393	13,348
No. 12 aluminum	21,708	13,577	11,302
Other aluminum-copper alloys	6,477	24,135	25,160

Aluminum alloy castings	9,851	480	448
Aluminum in chemicals	935	1,668	1,180

[1] Gross weight of alloys, including copper, silicon, and other added elements; total secondary ingot contained 1,038 tons of primary aluminum in 1941, 938 tons in 1942, and 8,471 tons in 1943.
[2] "Primary" ingot is a new classification of ingot made from scrap with 30 to 50 percent primary aluminum added to bring specifications of the alloys equal to those made entirely from primary metal.
[3] Combined with primary aluminum in the products of aluminum rolling mills.
[4] Data not available.
[5] Includes 18,552 tons produced on toll.

---

[3] Figures for aluminum scrap consumed by smelters and aluminum ingot produced were derived from a survey conducted by the War Production Board.

Makers of secondary aluminum ingot used 8,471 tons of primary aluminum and 8,916 tons of alloying ingredients, such as copper, silicon, and others, in addition to aluminum scrap. Technical advances in both remelting methods and quality of products were notable, and the secondary-metals industry earned a prominent position as a supplier of aluminum alloys meeting rigid specifications. In particular, its production of 45,063 tons of remelted aluminum suitable for blending with primary metal for use in wrought aluminum demonstrated the care with which scrap was handled and impurities held to a minimum at secondary smelters. The recovery of metal by all scrap users amounted to 89 percent of the gross weight of scrap consumed.

As in 1942, aluminum scrap was channeled either to primary producers or to approved secondary smelters, and manufacturers could obtain it only on special authorization. In consequence, only small amounts of aluminum chemicals, powder, and castings were made directly from scrap, although large quantities of these products were produced from secondary ingot and shot.

Consumption of purchased aluminum scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Aluminum rolling mills		Foundries and other manufacturers

	[1] 192,872	33,688	123,261	295	1,725	283	352,124

[1] Includes 26,616 tons treated on toll.

Consumption of aluminum scrap totaled 352,124 short tons (gross weight) in 1943, an increase of 62 percent over the 217,611 tons melted in 1942. Ingot makers consumed 226,560 tons at 57 plants, of which 20 were "approved" smelters, 36 "limited" smelters, and 1 experimental. Primary producers and other rolling mills used 123,556 tons at 21 plants, and the remaining 2,008 tons were consumed by chemical works, foundries, and miscellaneous manufacturers numbering approximately 200. The sources of old aluminum scrap, such as pots and pans and obsolete castings, were depleted to such an extent that the downward trend in the use of old scrap in evidence since 1940 was extended more sharply, and only 34,266 tons were used in 1943 compared with 43,248 tons in 1942. Consumption of new aluminum scrap totaled 317,858 tons, almost double the quantity consumed in 1942.

The new scrap consumed by makers of aluminum ingot consisted of 50 percent segregated borings and turnings, 12 percent mixed borings and turnings, 14 percent segregated solids including both sheet and cast, 6 percent mixed solids, and 18 percent low-grade scrap such as skimmings and grindings. Purchased new scrap consumed by primary producers and other rolling mills consisted of 94 percent solids and 6 percent borings and turnings, presumably all segregated.

Dealers in scrap metal entered the aluminum field to a much greater extent in 1943 than ever before. Their receipts of aluminum scrap increased 40 percent—from 103,856 tons in 1942 to 145,975 tons in 1943—and shipments to consumers increased 30 percent to 130,295 tons, while stocks in dealers' yards soared from 8,720 tons at the beginning of the year to 25,072 tons at the close. Part of the idle stocks apparently consisted of mixed industrial scrap fit only for low-grade ingot, but even so there was not enough of a pile-up to cause serious concern.

During the first half of 1943, smelter demand for aluminum scrap paced supply, and wrecked aircraft from both foreign battle fronts and our own training fields were bought up "as is" by a number of makers of aluminum-ingot. This policy brought immediate disastrous results, for unexploded ammunition, vapor-filled gasoline tanks, and oil-charged hydraulic landing-gear cylinders caused numerous explosions in the plants; further, not only was it difficult to handle large airplane sections in the smelters, but the metal recovered from uncleaned scrap was of poor quality. On June 26, 1943, the War Production Board prohibited the delivery of unprepared wrecked aircraft to anyone except dealers; and from that time on, a system of double inspection for unexploded ammunition in battle front scrap was carefully carried out at Army salvage centers. Approximately 3,000 tons of wrecked airplanes were brought to the United States from battle areas in 1943, mostly during the last 6 months of the year, but disposal became such a problem that orders to stop this importation were issued on January 20, 1944.

Many of the large lots of wrecked aircraft advertised for sale by the Army and Navy were bought by scrap dealers who had little or no previous experience with aluminum. As clean industrial aluminum scrap was being purchased by dealers at 5 or 6 cents a pound, the opportunity to buy wrecked aircraft at 0.38 to 0.75 cent a pound was hard to resist, and huge piles of the bulky scrap rose in many yards. According to a study made early in 1944, at least 45 dealers had stocks of wrecked aircraft exceeding 25 tons apiece, and some of them had more than 10 times that amount.

Ingot makers reported consumption of 2,981 tons of wrecked aircraft in 1943, and dealers in scrap metal had about the same amount on hand at the end of the year. With poor demand and an unfavorable price structure for wrecked aircraft scrap, dealers had little incentive to spend much effort on preparation, and some lots were sold with only the largest pieces of foreign material removed and the aluminum either baled or sheared to size.

Consumers' stocks of purchased aluminum-base scrap in the United States at end of year, 1942–43, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1942	Dec. 31, 1943
Castings and forgings	1,690	785
Sheet, turnings, clippings, etc	5,020	7,843
Miscellaneous aluminum and dross	1,915	3,109
	8,625	11,737

On January 1, 1943, the order controlling the use and distribution of aluminum scrap, which was due to have expired December 31, 1942, was extended indefinitely. On March 16, 1943, the War Production Board tightened its orders by an amendment which required segregation of aluminum scrap by persons generating 500 pounds or more of aluminum scrap per month, but after October 6 the regulation was limited to those generating 1,000 pounds or more per month. On December 20, 1943, the requirement that aluminum scrap held by generators or dealers be moved within 60 days was revoked.

On January 5, 1943, a maximum base price of 15 cents was set for secondary aluminum ingot, except low-grade, which was set at 14.5 cents, but smelters were permitted to ask higher prices for special alloys. The base price was dropped to 14 cents on June 18, 1943, to conform with the 14-cent price of primary aluminum pig, and the ceiling prices of aluminum scrap, which until that time had remained unchanged from 1942 levels, were lowered 0.5 to 1 cent a pound, with segregated clippings of 17S, 18S, 32S, and 52S aluminum assigned a maximum price of 14.5 cents. Ceiling prices of both secondary aluminum ingot and aluminum scrap were dropped another 1.5 cents a pound on December 18, 1943, bringing the base price for ingot to 12.5 cents and reestablishing the pre-war spread between prices of primary and secondary aluminum. Prices actually paid for aluminum scrap were said to be well below ceilings during the latter half of 1943.

Dealers' buying prices for cast-aluminum scrap in New York averaged 6.99 cents a pound in 1943, the lowest in 10 years, whereas the average in 1942 was 8.62 cents. Monthly average quotations held at 8.12 cents from January to May 1943, then dropped to the low point of 5.18 cents in December. New aluminum clippings averaged 7.72 cents a pound in 1943 compared with 9.50 cents in 1942. The monthly average in 1943 was 9.12 cents for the first 5 months but gradually decreased to 5.79 cents in December.

Imports of aluminum scrap through commercial channels totaled 241 tons in 1943, but an additional 3,000 tons (approximate) of aluminum scrap from foreign battle fronts were brought back to the United States by the Army. Imports of aluminum scrap in 1942 totaled 24 tons (revised); exports totaled 14 tons in 1943 compared with 32 tons in 1942.

SECONDARY MAGNESIUM

The 11,404 short tons of secondary magnesium (including alloying constituents) recovered in 1943 almost doubled the 6,238 tons reclaimed from purchased scrap in 1942 and was more than six times the quantity recovered in 1941. The value of secondary magnesium totaled $4,798,803 computed at 21.04 cents a pound in 1943 and $2,794,624 computed at 22.4 cents a pound in 1942.

As in the previous year, recovery of magnesium from old scrap amounted to only 1 percent of the total because objects for which magnesium was used had not yet started to return as old scrap to any appreciable extent.

Magnesium was recovered from purchased scrap as secondary magnesium ingot or blended with primary magnesium at 10 plants representing 8 concerns, and secondary magnesium was recovered by direct use in castings at 8 foundries, 6 of them operated by the American Magnesium Corporation. Altogether, 35 plants of various types reported consumption of a total of 13,909 tons of magnesium scrap. Minor uses took only 34 tons of recoverable magnesium, consumed in zinc alloys, in fluxing compounds, in metallurgical processing, in the Grignard reaction, and for production of magnesium nitrate and chloride.

Secondary magnesium recovered in the United States, 1942–43, in short tons

Type of product or use	1942	1943
Magnesium-alloy ingot[1] (gross weight)	6,045	11,009
Magnesium-alloy castings (gross weight)	93	327
In aluminum alloys	46	34
In lead alloys	2	
In zinc alloys	1	1
Consumed in chemical and metallurgical processes	51	33
	6,238	11,404
From new scrap	6,151	11,254
From old scrap	87	150

[1] Includes secondary magnesium incorporated in primary magnesium ingot.

Of the 13,909 short tons of purchased magnesium scrap consumed, 1,295 tons consisted of solid scrap and 12,614 tons consisted of borings, grindings, and dross, with borings the major item. Owing to the fire hazard presented by storage and the contamination of sand and iron that interfered with remelting, large quantities of magnesium sawings and grindings were burned or otherwise disposed of without recovery.

Stocks and consumption of magnesium scrap in the United States in 1943, gross weight, in short tons

	On hand—		Consumption during 1943
	Dec. 31, 1942	Dec. 31, 1943	
Cast scrap	9	32	1,152
Solid wrought scrap	8	14	143
Borings, grindings, drosses, etc	215	279	12,614
	232	325	13,909

The Government control of magnesium, including scrap and secondary metal, was continued in 1943 with only minor changes. Sales of magnesium scrap could be made only to primary producers or a list of six approved secondary remelters, except under specific authorization. According to an order effective December 31, 1942, segregation of magnesium scrap by alloy type was required at the source of generation, and maximum prices for scrap and remelt magnesium ingot were scheduled on January 20, 1943.

New segregated solids were exempt from ceilings, but segregated borings had a maximum price of 9 cents a pound, with mixed borings at 8 cents and mixed solids at 12 cents. The ceiling on Class A remelt magnesium ingot was 21.5 cents a pound. On June 26, 1943, dealers who previously had been at a loss as to how to assist their regular scrap suppliers to dispose of magnesium scrap were allowed to accept a service charge for picking up and loading it on railroad cars, the charge to be subtracted from the price paid by the buyer.

SECONDARY COPPER AND BRASS

Recovery of secondary copper totaled 1,086,047 short tons valued at $256,307,092 in 1943 compared with 927,755 tons valued at $218,950,180 in 1942. The value of copper has remained at 11.8 cents a pound for the last 3 years.

Contrary to all expectations, recovery of copper from old scrap did not decrease in 1943 but amounted to 427,521 tons, almost the same as the 427,122 tons recovered in 1942. The factors contributing to the maintenance of the flow of old copper and brass scrap included the replacement of copper bus bars in aluminum reduction plants by silver, the enforced sale of excess or idle inventories of copper and brass stock shapes, and the return of used matériel, notably fired cartridge cases.

Secondary copper recovered in the United States, 1942–43, in short tons

Secondary copper recovered			Recoverable copper content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As unalloyed copper:			New scrap:		
At primary plants	85,143	122,464	Copper-base	492,392	643,623
At other plants	29,504	15,419	Aluminum-base	7,389	13,348
			Nickel-base	851	1,555
	114,647	137,883	Tin-base	1	----------
In brass and bronze	779,062	912,782		500,633	658,526
In alloy iron and steel	1,164	1,021			
In aluminum alloys	13,894	19,396	Old scrap:		
In other alloys	1,533	1,946	Copper-base	424,441	425,264
In chemical compounds	17,455	13,019	Aluminum-base	1,973	1,664
			Nickel-base	633	409
	813,108	948,164	Tin-base	75	184
	927,755	1,086,047		427,122	427,521
				927,755	1,086,047

The unsurpassed production of munitions brought about a 32-percent rise in the recovery of copper as metal and in alloys from new scrap, from 500,633 short tons in 1942 to 658,526 tons in 1943. This total was more than four times the recovery from new scrap in 1939, when the influence of war had not been felt by our manufacturers.

The production of refined copper (electrolytic grade) from scrap rose to 128,836 short tons in 1943 from 102,975 tons in 1942, the increase being attributed to greater supplies of low-grade copper-bearing residues, such as brass ashes, and to a surplus of contaminated yellow brass that could not be used for brass ingot, and was therefore refined for its copper. Of the 11 refineries using scrap, 9 were well-known primary producers. Total recovery of unalloyed copper from scrap increased from 114,647 tons in 1942 to 137,883 tons in 1943.

Analysis and production of secondary copper and copper-alloy products in the United States, 1942–43

Item produced from scrap	Approximate analysis (percent)						Gross weight produced (short tons)	
	Cu	Sn	Pb	Zn	Ni	Al	1942	1943
Refined copper (electrolytic grade)	100						102,975	128,836

Brass and bronze sheet, rod, tubing, etc							[2] 531,159	[2] 605,009
Brass and bronze castings							[3] 111,631	[3] 109,472
Copper in chemical products (content)							17,455	13,019

[1] Includes 24,055 tons of ingot formerly classified as high-strength yellow brass.

[2] Gross weight of secondary brass and bronze in commercial shapes; included 370,837 tons of copper, 379 tons of nickel, 5,489 tons of lead, 273 tons of tin, 154,107 tons of zinc, 72 tons of aluminum, and 2 tons of antimony in 1942, and 422,818 tons of copper, 246 tons of nickel, 4,390 tons of lead, 282 tons of tin, 177,255 tons of zinc, and 18 tons of aluminum in 1943.

[3] Gross weight of secondary brass and bronze castings; included 95,224 tons of copper, 602 tons of nickel, 7,235 tons of lead, 5,389 tons of tin, and 3,181 tons of zinc in 1942, and 91,548 tons of copper, 18 tons of nickel, 7,840 tons of lead, 5,838 tons of tin, and 4,228 tons of zinc in 1943.

Commercial production of brass and bronze ingot rose to 488,185 short tons (gross weight) in 1943 compared with 402,660 tons in 1942. The copper content of brass ingot made in 1943 was 398,451 tons, of which 12,505 tons came from refined copper and the balance directly from scrap. Shipments of ingot totaled 494,370 tons, causing producers' stocks to fall from 15,356 tons (revised) at the beginning of the year to 9,171 tons on December 31, 1943. There were 75 plants producing brass ingot for sale in 1943, and 3 foundries made ingot for their own use. Copper shot and nickel-copper alloys were made at 2 additional plants that did not produce brass.

The melting capacity of brass mills was overtaxed during part of the year, and arrangements were made to have brass mill billets and cakes poured from scrap melts at 10 brass ingot plants. These smelters produced 25,991 tons of yellow rod brass, 4,305 tons of yellow brass, 1,683 tons of manganese bronze, 957 tons of gilding metal, 274 tons of tin bronze, 226 tons of aluminum bronze, and 13 tons of special alloys for shipment to brass rolling mills.

Brass mills recovered 1,586 tons of unalloyed copper products and 605,009 tons of brass and bronze sheet, rod, tubing, and other shapes from purchased scrap at 37 plants during 1943. As manufacturers were required to segregate "brass mill" scrap and to return it either directly or through a dealer to the brass mills, the condition of scrap as received at the mills was better than usual, and little difficulty was encountered in consumption of the huge volume of new scrap very nearly as rapidly as it was generated.

Foundries produced 109,472 tons of brass and bronze castings from purchased scrap, more than half this total consisting of railroad bearings made from scrap supplied by the railroads upon a toll basis.

Consumption of purchased copper scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Brass mills		Foundries and other manufacturers

	349,411	441,525	575,922	33,667	32,423	100,875	1,533,823

Consumption of purchased copper and brass scrap totaled 1,533,823 short tons, gross weight, in 1943 compared with 1,308,782 tons in 1942. Refineries and brass ingot makers together increased their consumption 27 percent to 790,936 tons, and brass mills raised their 1942 record 11 percent to 609,589 tons, but the 754 foundries and other manufacturers that used purchased copper and brass scrap dropped their consumption 2 percent to 133,298 tons in 1943. Remelting of fired cartridge cases rose from approximately 8,000 short tons in 1942 to 46,872 tons in 1943. Brass mills used one-third of this total and began to increase their purchases early in 1944. Most fired shell cases larger than 40 mm. were resized and reloaded, while smaller sizes were scrapped.

Except for scrap obtained from our own training camps or from naval vessels returning to home ports, there was little opportunity for used war matériel to be made available for recovery during 1943. Supply ships unloading near battle areas could not often wait to be loaded with bulky scrap for the return trip, although the end of the North African campaign provided a lull during which 264 tons of copper and brass scrap were sent back, along with 48,069 short tons of iron and steel and 2,921 tons of other nonferrous scrap, before the end of the year.

Although the return of yellow brass cartridge cases from sea actions started without much delay as the war developed, unalloyed copper and tin bronze were mostly installed in types of service that might take years to reach the scrap stage. Small bronze parts in guns, trucks, and tanks, and copper-base ship fittings are thus not expected to return as scrap for some time.

Throughout the year there was never enough unalloyed copper scrap or red brass and bronze scrap to meet demand. Many ingot makers found it expedient to process low-grade scrap in cupolas to make a stock alloy similar to black copper to be used in lieu of scarce red brass scrap, and a number of small metal-concentrating plants sprang up to recover the metallics from foundry skimmings for use in ingot rather than for refining. After most of the excess and obsolete inventories of copper and brass stock reported by manufacturers had been sold to war industries that could use them, 10,575 tons of these materials were allocated to ingot makers to help alleviate the shortage of scrap. At the end of September the Ordnance Department started selling gilding-metal clips to ingot makers at less than ceiling prices; nevertheless, 12,505 tons of refined copper, 8,643 short tons of pig tin, and lesser quantities of other refined metals were needed to fill material requirements for ingot.

Consumers' stocks of purchased copper-base scrap in the United States at end of year 1942–43, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1942[1]	Dec. 31, 1943
Unalloyed copper	9,235	10,255
Copper-base alloy	75,111	52,658
Low-grade scrap and residues	34,924	38,804
	119,270	101,717

[1] Revised figures.

Scrap consumers' stocks of copper and brass scrap dropped 15 percent from 119,270 tons (revised) at the beginning of the year to 101,717 tons on December 31, 1943.

Scrap-metal dealers supplied 496,943 tons of copper and brass scrap to consumers during 1943, just 2 percent more than the year before. Stocks of copper-base scrap in dealers' yards dropped 11 percent, from 54,815 tons on hand January 1, 1943, to 48,640 tons on December 31, 1943. There were approximately 4,500 scrap dealers whose monthly transactions in nonferrous scrap averaged more than 3 tons per month, but about 2,200 of these conducted 95 percent of the business.

Ceiling prices for brass and bronze ingots were continued throughout 1943 at the level fixed on August 19, 1942, with 85–5–5–5 at 12.25 cents a pound, 88–10–2 at 16.50 cents, 80–10–10 at 14.25 cents, and yellow brass at 10.00 cents a pound delivered in carlots. Including 4 types added to the list on February 1, 1943, 84 specific alloys of brass and bronze ingot were covered by the formal price order.

Maximum prices that could be paid for copper and brass scrap were carried into 1943 at the levels set on August 17, 1942, but 16 additional classes of scrap were added to the formal list on March 20, 1943, and 2 more on June 10, 1943, bringing the total number of specific kinds or grades other than "brass-mill scrap" to 46 for the balance of the year. Ceiling prices for the basic scrap items were unchanged, with No. 1 wire and heavy copper at 9.75 cents a pound, No. 2 wire and mixed heavy copper at 8.75 cents, No. 1 composition at 9.00

cents, and old rolled (yellow) brass at 7.75 cents a pound f. o. b. Scrap generated from the use of brass stock produced by brass mills was officially designated as "brass mill scrap," and maximum prices were first established on June 18, 1941. In 1943 the list contained 32 different classes, with a separate price within each class for clean heavy scrap, rod ends, and clean turnings. In general, brass mill scrap could be sold only to dealers or to brass mills. Plain heavy copper scrap falling within the brass mill group could be sold at 10.25 cents a pound, and yellow brass clips at 8.62 cents a pound f. o. b.

Dealers' buying prices[1] for copper-base scrap held at reasonable levels below ceilings, with monthly average quotations at New York for No. 1 copper scrap maintained throughout both 1942 and 1943 at 9.37 cents a pound. Prices for No. 1 composition scrap were quoted at 8.87 cents a pound all through 1943 compared with the year's average of 8.82 cents in 1942.

Complete allocation of all copper and copper-base materials, including scrap, to each specific use was continued in 1943 without much change from the controls in force at the end of 1942. Copper-base scrap could be sold only to dealers, brass mills, or consumers who had allocation certificates authorizing the purchase of such materials within prescribed quantity limits. The use of copper in any form was absolutely prohibited for many items, and relaxation of stringent conservation did not begin to appear until the second quarter of 1944.

Brass and copper scrap imported into and exported from the United States, 1942–43, in short tons

	1942	1943
Brass scrap imported	[1] 10,519	7,401
Scrap copper imported	912	3,002
Brass scrap exported	168	6
Scrap copper exported	[1] 1,215	443

[1] Revised figures.

SECONDARY NICKEL

The recoverable nickel content of nonferrous scrap used in 1943 totaled 6,917 short tons valued at $4,841,900 compared with 4,142 tons valued at $2,899,400 in 1942. As in the previous 2 years, the value was computed at 35.0 cents a pound, the spot-delivery price of electrolytic nickel, including duty.

Secondary nickel (nonferrous) recovered in the United States, 1942–43, in short tons

Secondary nickel recovered			Recoverable nickel content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As metal	90	796	New scrap:		
In nickel-base alloys	2,230	2,705	Nickel-base	1,698	4,385
In copper-base alloys	1,470	2,096	Copper-base	732	673
In cast iron [1]	114	522			
In chemical compounds	238	798		2,430	5,058
	4,142	6,917	Old scrap:		
			Nickel-base	1,373	1,215
			Copper-base	339	644
				1,712	1,859
				4,142	6,917

[1] Includes only nonferrous nickel scrap added to cast iron.

---

[1] Quoted from the American Metal Market.

Recovery of nickel as metal increased from 90 tons in 1942 to 796 tons in 1943, and the production of secondary monel-metal pig and shot went up from 2,564 tons in 1942 to 3,336 tons in 1943, whereas production of secondary copper-nickel pig and shot dropped from 1,154 tons averaging 40 percent nickel in 1942 to 875 tons averaging 46 percent nickel in 1943. Increases in nickel recovery from nonferrous scrap resulted mostly from the greater use of nickel residues and the expanded supply of new monel-metal clippings. Consumption of nonferrous nickel-bearing scrap rose to 14,409 short tons gross weight in 1943 compared with 7,908 tons in 1942. Scrap-metal dealers shipped 5,158 tons of scrap nickel and monel to consumers in 1943 compared with 3,297 tons in 1942. Dealers' stocks of nickel-base scrap varied only from 911 tons on hand January 1, 1943, to 811 tons on December 31, 1943, but consumers' stocks of purchased nickel-bearing scrap fell from 2,515 tons (revised) to 1,509 tons on these respective inventory dates.

Consumption of purchased nickel scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Pure nickel	268	35	147	255	705
Monel metal	4,184	1,034	320	142	5,680
Nickel silver	1,144	1,638	1,328	17	4,127
Miscellaneous nickel alloys	10	18	8	10	46
Nickel residues	3,109	194	359	189	3,851
	8,715	2,919	2,162	613	14,409

Primary nickel was put under complete allocation on May 15, 1941, and use of the metal in many items was prohibited after April 1, 1942, to conserve secondary nickel and nickel of any sort in fabricators' inventories. Segregation of all scrap containing nickel was ordered on April 24, 1942. Restrictions were tightened again on October 2, 1942, limiting the use of nickel in any form to implements of war, with a few specific exceptions. Even the use of nickel in coinage was stopped in September 1942, and a new alloy containing 35 percent silver, 56 percent copper, and 9 percent manganese was used thereafter in the familiar 5-cent piece. Control of nickel in its nonferrous applications was continued throughout 1943 without changes of any importance.

Maximum prices for nickel scrap remained as they had been set on June 2, 1941, with pure nickel scrap at 26 cents a pound and new monel-metal clippings at 20 cents a pound. Dealers' buying prices for nickel clips in New York were quoted at 21.00 cents a pound from the beginning of 1943 until the first week of November, then dropped to 20.00 cents for the remainder of the year, and monel clips were steady all year at 16.00 cents a pound. The average price of nickel clips in 1943 was 20.83 cents a pound compared with 23.00 cents in 1942, and monel clips averaged 16.00 cents in 1943 compared with 17.00 cents in 1942.

No imports of nickel-bearing scrap were reported, but exports totaled 5,633 short tons in 1943 and 4,498 tons in 1942.

Consumers' stocks of purchased nonferrous nickel scrap[1] *in the United States at end of year, 1942–43, gross weight, in short tons*

Scrap item	On hand—	
	Dec. 31, 1942[2]	Dec. 31, 1943
Unalloyed nickel	125	139
Nonferrous nickel alloys	1,863	1,108
Nickel residues	527	262
	2,516	1,509

[1] Includes nickel-silver scrap.
[2] Revised figures.

SECONDARY LEAD

The secondary-lead industry improved in 1943, with 341,243 short tons of lead valued at $43,679,104 recovered compared with 323,001 tons valued at $40,698,126 in 1942, but activity was still 56,000 tons below the 1941 record. Values were computed at 6.4 cents a pound in 1943 and 6.3 cents a pound in 1942. Production of soft lead from scrap dropped 15 percent to 58,591 tons compared with 68,870 tons in 1942, but the secondary-lead content of antimonial lead rose 3 percent to 176,076 tons in 1943 in contrast with 170,559 tons in 1942. Secondary lead recovered in solder rose 90 percent—from 17,611 tons in 1942 to 33,529 tons in 1943—while the secondary-lead content of type-metal production remained almost the same, at 23,201 tons in 1943 compared with 23,741 tons in 1942. An additional 1,489 tons of scrap type metals were withdrawn from circulation and separated into antimonial lead (1,398 tons) and tin (45 short tons) in the tin-conservation program supported by the Metals Reserve Company.

Secondary lead recovered in the United States, 1942–43, in short tons

Secondary lead recovered			Recoverable lead content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As metal:			New scrap:		
At primary plants	12,856	21,634	Lead-base	8,569	22,361
At other plants	55,746	36,688	Copper-base	5,844	9,030

[1] Difference between gross weight of product and secondary-metal content represents added primary metals or impurity content.

Of the total secondary lead recovered, 315,758 short tons were reclaimed from lead- and tin-base scrap, whereas the remaining 25,485 tons were lead contained in secondary brass and bronze produced by remelting copper-base scrap. A total of 3,140 tons of lead reclaimed from lead-base scrap was added to brass and bronze to bring the total recovery of secondary lead in this type of product to 28,625 tons.

Consumption of purchased lead scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead		48,779	940	795	50,514
Hard lead		18,763	2	2,132	20,897
Cable lead		17,607		47	17,654
Battery-lead plates		229,059		6	229,065
Mixed common babbitt		8,907		7,486	16,393
Solder and tinny lead	100	13,889	3,656	44	17,689
Type metals		18,321		100	18,421
Dross and residues	24,206	25,474	221		49,901
	24,306	380,799	4,819	10,610	420,534

Consumption of lead-base scrap totaled 420,534 short tons, gross weight, in 1943 compared with 396,531 tons used in 1942. The use of soft lead scrap rose 10,003 tons, of battery-lead plates 7,483 tons, mixed common babbitt 5,382 tons, and solder scrap 6,135 tons; but consumption of type-metal scrap dropped 2,268 tons, and treatment of drosses and residues fell off 7,653 tons. Purchased lead-base scrap was consumed at 290 plants classed as remelters, smelters, or refiners and at 263 plants classed as foundries or other manufacturers. Consumption of lead scrap at plants of remelters and smelters was highest in April, then dropped to the year's low in May and June. Further peaks of activity were noted in August and October, with other months near the average rate.

More secondary lead could have been recovered in 1943, because demand was fairly strong and additional scrap, particularly battery lead, was available for collection, but both dealers and smelters were hampered by lack of manpower. The armed forces and highly paid war industries took heavy toll of the peddlers who normally gathered scrap from farms, households, stores, and garages, and there was the added difficulty of obtaining sufficient gasoline, tires, and parts to keep trucks in continuous operation. Few men could be found to fill the unpleasant job of breaking up old batteries in dealers' yards, particularly in the winter. Occasional reports indicated that primary lead was used by some secondary smelters to fill orders for antimonial lead that ordinarily would have been produced from battery plates if workers had been available.

Pigged percentage metals circulated among remelters and smelters in 1943 totaled 56,853 short tons consisting of 31,500 tons of antimonial lead, 7,873 tons of soft lead, 6,294 tons of solder, 4,465 tons of lead-base bearing metals, 2,848 tons of type metals, 1,757 tons of tin babbitt, 1,671 tons of cable lead, 205 tons of pewter, 181 tons of remelt tin, and 59 tons of tin-bearing lead.

When a new type of monthly survey was applied to the secondary-lead industry, the inventory of lead scrap and residues at smelters, previously reported for December 31, 1942, as 53,460 tons, was revised upward by more exact reporting to 76,171 tons. Improved demand for secondary-lead-base products during 1943 brought stocks of soft lead scrap down from 4,802 tons to 2,459 tons and stocks of lead-base alloy scrap down from 47,280 tons to 37,647 tons on December 31, 1943, but the lack of extra manpower needed to work low-grade materials caused an increase in accumulated stocks of drosses and residues from 24,089 tons to 31,394 tons (gross weight). Total stocks of scrap and residues at remelters' and smelters' plants were reported as 71,500 short tons on December 31, 1943.

Consumers' stocks of purchased lead-base scrap in the United States at end of year, 1942–43, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1942[1]	Dec. 31, 1943
Unalloyed lead	4,802	2,459
Lead-base alloy	47,280	37,647
Drosses and residues	24,089	31,394
	76,171	71,500

[1] Revised figures.

Scrap-metal dealers' stocks of lead-base scrap fell from 37,333 tons on December 31, 1942, to 35,810 tons on December 31, 1943, and shipments of lead scrap from dealers to consumers totaled 279,580 tons in 1943 compared with 306,192 tons in 1942. Movement of scrap through dealer channels was brisk at the beginning of 1943 but dropped month by month to a low point in May, then stayed quite level for the balance of the year, except for a temporary peak in November.

The maximum prices for lead scrap that had been fixed on January 15, 1942, were continued throughout 1943, but effective January 20, 1943, 6 new basing points for determination of prices were added to the list, raising the total number to 152. With the ceiling on primary pig lead at New York fixed at 6.50 cents a pound f. o. b., the comparable price for heavy lead scrap, according to the formula, was the base price of primary lead less 0.55 cent, or 5.95 cents a pound.

Dealers' buying prices for heavy lead scrap in New York averaged 5.37 cents a pound in 1943 compared with 5.49 cents in 1942. There was no change in the monthly average quotation after it dropped to 5.37 cents in August 1942. Dealers' buying prices for battery-lead plates at New York were quoted at 2.75 to 2.87 cents a pound throughout 1943 without change. Since toll agreements for smelting scrap were prohibited except by specific authorization by the Office of Price Administration, battery-plate smelting charges were not regularly quoted.

Both scrap and secondary lead remained subject to allocation by the Government in 1943, but very little interference with free movement was found necessary. Scrap dealers were prohibited from receiving lead scrap unless they had moved, in the preceding 60 days, a quantity at least equal to their inventory at the current date, this regulation having been in effect since May 18, 1942. On January 6, 1943, the quota for production of storage batteries was raised from 90 to 100 percent of 1941 production, and on May 26, 1943, the 90-percent limitation on use of lead in essential items was removed, and a few additional uses of lead were permitted. These changes improved the market for secondary lead.

Imports of lead scrap totaled 496 short tons in 1943 compared with 1,305 tons in 1942 and no exports were recorded in 1943 compared with 26 tons listed in 1942.

SECONDARY TIN

Secondary tin recovered from scrap in 1943 totaled 37,820 short tons valued at $39,332,800 compared with 37,918 short tons valued at $39,434,720 in 1942. The value was computed at 52.0 cents a pound in both years.

Detinning plants produced 4,327 short tons of pig tin from new tinplate clippings and old cans, and 900 short tons (tin content) of secondary pig tin and 25 tons of tinfoil were produced at various plants from tin-base scrap and residues. The total recovery of unalloyed tin from scrap was 5,252 short tons in 1943 compared with 5,799 tons in 1942. Recovery of secondary tin in solder remained almost the same as in the previous year; but tin in tin-base babbitts was almost doubled in 1943, and tin reclaimed in lead-base alloys was virtually cut in half. Owing to the increased use of high-tin bronzes in war applications, the recovery of secondary tin in bronze increased from 17,444 tons in 1942 to 19,171 tons in 1943.

Secondary tin recovered in the United States, 1942–43, in short tons

Secondary tin recovered			Recoverable tin content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As metal:			New scrap:		
At detinning plants	5,261	4,327	Tin plate	4,896	2,591
At other plants	538	925	Tin-base	2,980	2,197
			Lead-base	1,796	1,708
	5,799	5,252	Copper-base	4,385	6,147
In solder	6,579	6,588		14,057	12,643
In tin babbitt	1,597	3,112			
In chemical compounds	303	250	Old scrap:		
In lead-base alloys	6,196	3,447	Tin cans	597	1,986
In brass and bronze	17,444	19,171	Tin-base	3,490	4,795
			Lead-base	7,871	6,542
	32,119	32,568	Copper-base	11,903	11,854
	37,918	37,820		23,861	25,177
				37,918	37,820

Very little block-tin scrap could be found anywhere, and the flow of tin dross and residues was lessened in 1943, but babbitt scrap was available in unusually large quantities. Almost half of the secondary tin reclaimed for use was contained in brass and bronze scrap, and tin-base, lead-base, and tin-plate scrap supplied the remainder, the proportion decreasing in the order given. Type-metal scrap that was available in excess of industrial requirements was treated by the National Lead Co. for the account of the Metals Reserve Company, starting in April 1943, and tin was removed as sodium stannate, then reduced to pig tin at another plant. Only 45 short tons of tin emerged from this process in 1943.

Consumption of purchased tin scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		737	10	85	832
Tin scruff and dross	2,612		4		2,616
No. 1 pewter		562			562
High-tin babbitt		4,040		82	4,122
Residues	1,376	113			1,489
	3,988	5,452	14	167	9,621

All classes of scrap having any appreciable tin content were in good demand all year, for every effort was made to conserve the dwindling stock pile of imported tin. The surrender of a used collapsible tube when each new tube of toilet preparations was purchased was continued throughout 1943, and the Tin Salvage Institute as agent for the Metals Reserve Company recovered 257 short tons of tin in 1,014 tons of lead-tin alloys from collapsible tubes during the year. Owing to the use of lead-tin composition tubes in place of tin tubes for most applications, the recovery of tin from this source declined rapidly as time went on.

The dealers' buying price for block-tin pipe scrap at New York was quoted at 45.50 cents a pound throughout 1943, as it had been in 1942. Dross and residues of tin, solder, babbitt, and type metals were exempt from price control, and metallic scrap-tin materials were also exempt when sold to dealers or smelters. When sold to an industrial consumer, tin scrap was subject to the provision of the General Metals Price Regulation based upon pre-war sales prices.

Consumers' stocks of purchased tin-base scrap in the United States at end of year, 1942–43, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1942 [1]	Dec. 31, 1943
Unalloyed tin	151	69
Tin-base alloys	682	419
Drosses and residues	1,624	1,387
	2,457	1,875

[1] Revised figures.

Tin scrap was subject to allocation whenever necessary, but Government powers were seldom invoked in this regard during 1943. Scrap-metal dealers' inventories were limited by a 60-day turn-over rule and remained low.

Detinning plants.—There were 7 detinning plants in operation in 1943: Johnston & Jennings Co., Metal & Thermit Corporation (3 plants), Standard Metal Refining Co., and the Vulcan Detinning Co. (2 plants). Construction on 10 detinning plants to be built by the Government was halted in February 1943, before actual building had begun, because the available supply of cans was far below existing capacity, but plans for one plant at Birmingham, Ala., were later reinstated. This plant was built during 1943 and was to start operations early in 1944.

Secondary tin recovered at detinning plants in the United States, 1942–43

	1942	1943
Scrap treated:		
Clean tin plate ... long tons	287,660	206,336
Old tin-coated containers ... do	51,721	175,870
	339,381	382,206
Tin recovered as metal:		
New tin-plate clippings ... short tons	4,664	2,432
Old tin-coated containers ... do	597	1,895
Tin content of tin compounds produced ... do	231	250
	5,492	4,577
Weight of tin compounds produced ... do	484	537
Average quantity of tin recovered per long ton of clean tin-plate scrap used ... pounds	34.03	25.12
Average quantity of tin recovered per long ton of old tin-coated containers used ... do	23.06	22.58
Average delivered cost of clean tin-plate scrap ... per long ton	$18.97	$16.62
Average delivered cost of old tin-coated containers ... do	$12.37	$13.88

Although most large municipalities were ordered to collect used cans that had been washed and flattened for shipment to detinning plants, the public response to appeals for cooperation in preparing the cans was disappointing in many localities. Only 175,870 long tons of old tin-coated containers were made available for detinning, and part of this quantity consisted of unprepared cans put through shredding plants. Prepared cans from Army depots comprised almost one-fifth of the total.

The substitution of electroplating for hot dipping of tin plate in a number of plants brought about a decline in the average quantity of tin recovered per long ton of clean tin-plate scrap, from 34.03 pounds in 1942 to 25.12 pounds in 1943. The effect of the reduced thickness of tin coating was not so well-marked in old cans, owing to the time lag before canned goods reached the ultimate consumer, and recovery dropped only from 23.06 pounds to 22.58 pounds of tin per long ton of cans treated.

Imports of tin-plate scrap totaled 19,591 long tons compared with 24,082 long tons in 1942. Exports of tin-plate scrap, circles, wastewaste, and clippings dropped to 1,740 long tons contrasted with 4,639 long tons in 1942 and 14,168 long tons in 1941.

SECONDARY ANTIMONY

Recovery of secondary antimony in lead-base and tin-base alloys totaled 15,483 short tons valued at $4,929,787 in 1943 compared with 18,200 tons valued at $5,663,840 in 1942. The value was computed at 15.92 cents a pound—the average selling price for ordinary brands of American-grade antimony in 1943—and at 15.56 cents a pound in 1942.

Secondary antimony recovered in the United States, 1942–43, in short tons

Secondary antimony recovered			Recoverable antimony content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
In antimonial lead	11,943	9,255	New scrap:		
In other lead alloys	6,019	5,444	Lead-base	(1)	62
In tin-base alloys	201	784	Tin-base	3	
In copper-base alloys	37				
				3	62
	18,200	15,483	Old scrap:		
			Lead-base	18,017	15,109
			Tin-base	180	312
				18,197	15,421
				18.200	15,483

[1] Less than 1 ton.

The maximum antimony content of battery grids had been limited to 7.5 percent in the first half of 1942, and apparently this contributed to the drop in recovery of antimony from old battery-lead plates to 7,215 tons during 1943 compared with 10,237 tons reclaimed from this source in 1942. Recovery of antimony from other classes of scrap, such as bearing metals, type metals, and drosses, increased 305 tons in 1943. Remelters and smelters recovered 92 percent of the secondary antimony, and the other 8 percent was reclaimed by bearing manufacturers. Consumption of purchased scrap from which antimony was recovered may be found in lead-base and tin-base scrap-consumption tables in the sections of this chapter devoted to those metals, and products in which secondary antimony was recovered are included in the lead- and tin-products table. As far as could be determined, all antimony recovered from scrap remained in the alloyed state, and none was recovered as unalloyed metal or in chemical compounds.

The maximum allowable antimony content of storage battery grids was raised from 7.5 to 12 percent on August 8, 1942, but on March 8, 1943, all limitations on the antimony content of alloys were removed. Allocation of antimony to consumers was started May 1, 1942, and ended at the close of 1943.

The ceiling price for antimony in alloy metals or metallic scrap remained at 15.50 cents a pound of contained antimony, this ceiling having been last adjusted April 1, 1942, but there was no regulation of prices for antimony in drosses or other residues. The prices of primary antimony had been voluntarily held down by producers and importers since March 1942 at the request of the Government, but formal ceilings at the same level were established on December 4, 1943.

The maximum price for standard-grade antimony, 99 to 99.8 percent pure, was fixed at 14.50 cents a pound at Laredo, Tex.

SECONDARY ZINC

Secondary zinc recovered in 1943 from purchased scrap totaled 368,488 tons with a value of $63,379,936 calculated at 8.6 cents a pound, the average selling price for the year of all grades of refined zinc. This total was 11 percent higher than in 1942, when 330,526 tons with a value of $57,511,524 at 8.7 cents a pound were recovered.

Secondary zinc recovered[1] in the United States, 1942–43, in short tons

Secondary zinc recovered			Recoverable zinc content of scrap		
Form of recovery	1942	1943	Kind of scrap processed	1942	1943
As metal:			New scrap:		
By distillation:			Zinc-base	95,296	94,845
Slab zinc	52,712	47,791	Copper-base	162,242	189,414
Zinc dust	17,685	22,336	Aluminum-base	1	4
By remelting	11,048	8,765			
				257,539	284,263
	81,445	78,892	Old scrap:		
In zinc-base alloys	3,670	4,808	Zinc-base	29,200	29,588
In brass and bronze	212,038	253,082	Copper-base	43,787	54,637
In aluminum-base alloys	18	96			
In chemical products:				72,987	84,225
Zinc oxide	4,373	5,375			
Zinc sulfate	2,150	2,707		330,526	368,488
Zinc chloride	10,815	11,104			
Lithopone	15,750	11,110			
Miscellaneous	267	1,314			
	249,081	289,596			
	330,526	368,488			

[1] Zinc content.

There was a 19-percent rise in the secondary zinc recovered from purchased scrap in brass and bronze products, a 26-percent gain in the secondary zinc in zinc dust, and smaller gains in the secondary-zinc content of zinc-base alloy products and most pigments and salts. The recovery of secondary zinc in lithopone fell 29 percent but was still higher than in any of the other zinc-chemical products. Of the 253,082 tons of secondary zinc recovered in brass and bronze, only 9,031 tons came directly from zinc-base scrap, the remainder being reclaimed from brass scrap. The increased recovery of zinc in new brass scrap, from 162,242 tons in 1942 to 189,414 tons in 1943, resulted mostly from the expanded ammunition program, whereas the increase in zinc recovered in old brass scrap, from 43,787 tons in 1942 to 54,637 tons in 1943, was attributed to the remelting of fired cartridge cases.

Production of secondary-zinc and zinc-alloy products in the United States, 1942–43, gross weight, in short tons

Products	1942	1943
Redistilled slab zinc	53,195	48,215
Zinc dust	18,101	22,788
Remelt spelter[1]	8,637	7,406
Remelt die-cast slab	2,488	2,641
Zinc-die and die-casting alloys	1,403	2,617
Galvanizing stock	683	591
Rolled zinc	1,958	909
Zinc in chemical products	33,355	31,610

[1] Includes small tonnages of zinc anodes.

Total production of redistilled slab zinc, 48,215 tons, represented a 9-percent decline from the 1942 total, but 22,788 tons of zinc dust were produced from scrap in 1943—an increase of 26 percent over the 1942 output. Zinc dust made from scrap amounted to 87 percent of the total production from all sources. The increased recovery of secondary zinc in dust almost counterbalanced the decline in redistilled slab, the total redistilled production for 1943 amounting to 71,003 tons compared with 71,296 tons in 1942. Twenty-four distillers used zinc scrap in 1943, and of these 14 made only redistilled slab, 4 made only dust, and the other 6 made both. Four plants that had been active as redistillers in 1942 showed no production of either redistilled slab or dust in 1943. Of these, 1 had been a dust producer and 3 had made slab zinc.

Other metallic zinc products reclaimed from scrap in 1943 dropped to 14,164 tons compared with 15,169 tons in 1942 as a result of declines of 1,231 and 1,049 tons, respectively, in the production of remelt spelter and rolled zinc, partly counterbalanced by increases in the output of remelt die-cast slab and zinc die and die-casting alloys made from scrap. A considerable quantity of a new type of scrap from the manufacture and use of zinc-alloy forming dies entered the industry in 1943 and was reused in further production of zinc dies. Another new type of scrap consisted of turnings from the production of zinc-alloy screws, and this scrap was also remelted and returned to its original application.

Although the trend of zinc chemical production increased throughout 1943, the 31,610 tons of secondary zinc recovered in pigments and salts at 60 chemical plants were 1,745 tons less than in 1942 and 16,894 tons (35 percent) less than the 48,504 tons recovered in 1941. Most of the zinc sulfate and chloride and nearly all the zinc dust produced in the country are made from scrap, but most lead-free zinc oxide and most lithopone are made from other raw materials, such as ore, by-product residues from ore treatment, refined zinc, remelt spelter, and remelt die-cast slab.

In addition to the distillers and chemical works that recovered secondary zinc, 122 remelters, including brass-ingot makers, zinc smelters, and scrap-metal dealers, and 110 foundries and other manufacturers consumed purchased zinc scrap in 1943.

Consumption of purchased zinc scrap in the United States in 1943, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	3,901		1,142		5,043
Sheet and strip		6,928		340	7,268
Engravers' plates		2,875		212	3,087
Skimmings and ashes	41,388		22,949		64,337
Dross	43,610		284		43,894
Die castings and other alloyed zinc	3,201	10,934	93	170	14,398
Flue dust and residues	12,024	11,908	12,551	11,242	47,725
	104,124	32,645	37,019	11,964	185,752

Consumption of zinc-base scrap in 1943 was 185,752 tons—4,922 more than in 1942—but the consumption of all types of scrap except flue dust and residues decreased, and the latter two types together gained 11,903 tons. The declining trend in consumption of solid-metal scrap was more pronounced in the latter half of the year than in the first half, but use of drosses and residues increased at a steady rate throughout the year. Although only 16 percent of the total weight of zinc-base scrap processed in 1943 was solid metal and 84 percent drosses, skimmings, flue dust, and other residues, three-fourths of the zinc recovered from zinc-base scrap emerged in metal products and only 25 percent in zinc chemical form. Results of a special study of the distribution of zinc scrap in December 1943 indicated that consumption of metallic zinc scrap was concentrated in the areas surrounding New York and Chicago and less than 10 percent was used throughout the rest of the country. About one-third of the total metallic zinc scrap handled by dealers was gathered in 6 States in the general vicinity of New York and Philadelphia, and another third in 7 States surrounding Chicago. The balance of the metallic zinc scrap reported by dealers was scattered among 35 States, with only California and Texas showing any considerable collection.

Consumers' stocks of purchased zinc-base scrap in the United States at end of year, 1942–43, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1942	Dec. 31, 1943
Metallic zinc scrap	2,960	3,574
Dross	4,232	6,579
Skimmings and residues	34,625	27,485
	41,817	37,638

Nonferrous-scrap-metal dealers' shipments of zinc-base scrap and residues to consumers totaled 50,435 tons in 1942 but only 44,483 tons in 1943, having exhibited a declining trend throughout most of the latter year. Of this total, 25,753 tons were metallic scrap, which represented 81 percent of all the metallic scrap used by consumers of zinc-scrap. Only 12 percent of the drosses and residues purchased by scrap users was furnished by dealers, the remainder having been shipped directly to smelters from the plants where it was generated.

On March 18, 1943, the Office of Price Administration effectuated amendments to maximum price regulations to equalize prices for less-than-carlots of secondary slab zinc at the prices for carlots. The new regulation also provided that secondary slab of lower grade than Prime Western should be sold at prices under the maximum for that grade. The maximum base price for Prime Western secondary slab zinc during 1943 was 8.25 cents a pound. Ceiling prices for zinc scrap remained unchanged in 1943, with new clippings at 7.25 cents and old zinc at 5.75 cents a pound, but dealers' buying prices edged slightly lower during the year and were always 1.50 to 3.30 cents lower than the ceilings. At New York dealers' buying prices for new zinc clippings averaged 5.88 cents a pound during 1943 and ranged from a high of 6.00 cents in January and February to a low monthly average of 5.65 cents a pound in December. The average monthly price for old zinc scrap was 4.12 cents a pound throughout the year.

Imports of old zinc scrap into the United States amounted to 114 tons in 1943 compared with 143 tons in 1942. Drosses and residues imported totaled 5,032 tons in 1943, a rise of 1,833 tons from the 3,199 tons imported in 1942. Large quantities of fume from a primary smelter in Canada were imported by one company for the manufacture of zinc sulfate, but the zinc reclaimed from this material was not counted as secondary zinc.

MAXIMUM PRICES FOR CERTAIN SCRAP METALS

COPPER AND BRASS SCRAP

(Set by OPA; Effective June 10, 1943)

The following are maximum prices, f. o. b. freight cars, trucks or other means of transportation at the point of shipment and include all commissions and service charges:

Item No.	Grade of scrap	Maximum price per pound of material (cents)
1.	No. 1 copper wire and No. 1 heavy copper	9.75
1.	No. 1 tinned copper wire and No. 1 tinned heavy copper	9.75
1.	No. 2 copper wire and mixed heavy copper	8.75
1.	Copper tuyeres	8.75
1.	Light copper	7.75
1.	Copper borings	9.75
1.	Lead covered copper wire and cable	([1])
1.	Insulated copper	([2])
2.	Bell metal	15.50
2.	High grade bronze gears	13.25
2.	High grade bronze solids	([3])
2.	High grade—low lead bronze borings	([4])
2.	Babbitt lined brass bushings	13.00
2.	High lead bronze solids	([5])
2.	High lead bronze borings	([6])
2.	Red trolley wheels	10.75
2.	Tinny bronze (phosphor bronze) solids	10.50
2.	Tinny bronze (phosphor bronze) borings	10.50
2.	Copper nickel solids and borings	9.25
2.	Bronze paper mills wire cloth	9.50
2.	Aluminum bronze solids	9.00
2.	Soft red brass (No. 1 composition)	9.00
2.	Soft red brass borings (No. 1 composition borings)	9.00
2.	Contaminated gilding metal turnings	8.50
2.	Unlined standard red car boxes	8.25
2.	Lined standard red car boxes	7.75
2.	Cocks and faucets	7.75
2.	Mixed brass screens	7.75
2.	Red brass breakage (irony composition)	7.50
2.	Old nickel silver solids	6.25
2.	Old nickel silver borings	6.25
2.	Yellow brass castings	5.25
2.	Copper-lead solids	6.25
2.	Copper-lead borings	6.25
3.	Zincy bronze solids	8.00
3.	Zincy bronze borings	8.00
3.	Fired rifle shells	8.25
3.	Brass pipe	8.00
3.	Old rolled brass	7.75
3.	Admiralty condenser tubes	8.00
3.	Muntz metal condenser tubes	7.50
3.	Plated rolled brass sheet, pipe and reflectors	7.50
3.	Manganese bronze solids (0.4% pb. or less)	7.25
3.	Manganese bronze solids (0.41% to 1% pb.)	6.25
3.	Manganese bronze borings (0.4% pb. or less)	6.50
3.	Manganese bronze borings (0.41% to 1% pb.)	5.50
4.	Automobile radiators	7.00
5.	Refinery brass (over 60% cu.)	([7])
5.	Refinery brass (50.01% to 60% cu.)	([8])

[1] (a) Multiply gross weight, less weight of lead covering and any insulation by price for applicable grade of copper wire; (b) divide result by gross weight; and (c) deduct from resulting quotient 0.15c. This is maximum price. In addition payment may be made for lead covering at maximum price established by MPR 70. Maximum price may be determined by applying foregoing to representative sample.

[2] (a) Multiply gross weight less weight of insulation by price for applicable grade of copper; (b) divide result by gross weight; and (c) deduct from resulting quotient 0.15c. This is maximum price. Maximum may be determined by applying foregoing computation to representative sample.

[3] Price shall be determined by application of section 1309.70 (b) (3) of MPR 20 to analysis, other than by inspection, of material. If consumer receives less than 5,000 pounds in a shipment, he may determine by inspection that material meets specifications but in such case, the maximum is 10.75c. In either case, price is subject to 1% deduction for each 1% of dirt, etc.

[4] Price shall be determined by application of section 1309.70 (b) (3) of MPR 20 to wet or natural analysis after button analysis has determined proper classification. If consumer receives less than 2,000 in a shipment at one time, he may determine by inspection that material meets specification but in such case maximum is 10.00c subject to 1% deduction for each 1% of dirt, etc.

[5] Maximum shall be calculated by application of following method to analysis other than by inspection:
1.25% zn or less: cu content x 9.25c + sn content x 33c
1.26% to 4% zn; cu content x 9c + sn content x 32c
4.01% zn or more: cu content x 8.5c + sn content x 30c
However, 0.01c per pound of material shall be added or deducted for each 0.01% antimony below 0.25% or above 0.75%. If consumer receives less than 40,000 pounds in a shipment at one time he may determine by inspection that material meets specifications but in such case maximum is 9.50c. In either case, price is subject to 1% deduction for each 1% of dirt, etc.

[6] Apply same method as for high lead bronze solids to wet or natural analysis after button analysis has determined proper classification of zinc content. If consumer receives less than 5,000 in a shipment at one time, he may determine by inspection that material meets specifications but in such case maximum is 9.25c subject to 1% deduction for each 1% of dirt, etc.

[7] 60.01% dry copper content (61.31% wet assay) times 8.00c.
50.01% dry copper content (51.31% wet assay) times 7.75c.

QUANTITY PREMIUMS.

(i) For shipment at one time of 60,000 pounds or more of only one item other than Item 4 or Item 5—¾c per pound;

(ii) For shipment at one time of 40,000 pounds or more of one or two items—½c per pound.

(iii) For the shipment by one person in one railroad car of 60,000 pounds or more of material eligible for the 0.75 cent per pound premium provided for in subdivision (i) of this paragraph and, in the same railroad car, 20,000 pounds or more of any one other group—0.50 cent per pound for the material composing such other group in addition to 0.75 cent per pound for the 60,000 pound group.

No quantity premium may be added if any special use, briquetting or crucible shape premium has been added to such price.

BRIQUETTING AND CRUCIBLE SHAPE PREMIUMS.

No. 1 copper wire and No. 1 heavy copper	1¼c
No. 1 tinned copper wire and No. 1 tinned heavy copper	1¼c
No. 2 copper wire and mixed heavy copper	1c
Manganese bronze solids	2½c
All other copper alloy scrap	1¼c

Above premiums not applicable on sales to copper refiner or brass and bronze ingot manufacturer.

SPECIAL USE PREMIUMS.

To the maximum price of any grade of copper scrap a special use premium of 1¼c may be added if the material has been prepared to meet the consumer's specifications and is suitable for direct use without further preparation. Not applicable on sales to refinery, ingot maker, foundry or brass mill.

No special use, briquetting or crucible shape premium may be added if any quantity premium has been added.

BRASS-MILL SCRAP

Revised to Oct. 29, 1942, by OPA (f. o. b. shipping point)

	Heavy Scrap	*Rod Ends*	*Turnings*
Copper	10¼	10¼	9½
Tinned copper	9⅝	9⅝	9⅜
Commercial bronze:			
95% or more Cu	9½	9¼	8¾
90% to 95% Cu	9⅜	9⅛	8⅝
Red brass: 80% or more Cu	9⅛	8⅞	8⅜
Best quality brass: 71% to 80% Cu	8¾	8½	8
Yellow brass	8⅝	8⅜	7⅞
Muntz metal	8	7¾	7¼
Nickel silver:			
5% Ni	9¼	9	4⅝
10% Ni	10⅛	9⅞	5 1/16
15% Ni	10⅞	10⅝	5 3/16

Maximums are for shipments of less than 15,000 pounds. For 15,000 to 40,000 pounds add 0.62½c but heavy scrap may not be mixed with rod ends and/or turnings. For over 40,000 pounds add 1.00c for any mixture.

ZINC SCRAP

Established Oct. 17, 1941 by OPA (Per lb. f. o. b. point of shipment)

(Prices are for clean, dry scrap, free of iron and other foreign material).

New zinc clippings and trimmings	7.25c
Engravers' and lithographers' plates	7.25c
Old zinc scrap	5.75c
Unsweated zinc dross	5.80c
Die cast slab	5.80c
New die cast scrap	4.95c
Radiator grilles, old and new	4.95c
Old die cast scrap	4.50c

Premium of 0.50c per pound allowed for shipments at one time of 10,000 pounds of new zinc clippings, engravers' and lithographers' plates and old zinc scrap or any combination of the three; and for shipment at one time of 20,000 pounds of new or old die cast scrap and radiator grilles or any combination of the three. No premium is allowed on galvanizers' dross or die cast slab.

ALUMINUM SCRAP

Revised to Dec. 23, 1943, by OPA (f. o. b. shipping point)

Following are the maximum prices for aluminum scrap (in cents per pound):

	I Lots of under 1,000 lbs.	II Lots of 1,000 to 20,000 lbs.	III Lots of 20,000 lbs. or more
1. Plant scrap, segregated:			
Solids:			
All S-type alloys except 2S	8½	9½	10
2S	8	9	9½
High grade alloys	7	8	8½
Low grade alloys (includ. No. 12 and piston alloys)	6½	7½	8
Borings and turnings:			
High-grade alloys (including all S-type)	5½	6½	7
Low grade alloys (includ. No. 12 and piston alloys)	5	6	6½
2. Plant scrap, mixed:			
All solids	6	7	7½
Borings and turnings	4	5	5½

Following are the maximum prices for aluminum scrap (in cents per pound)—Con.

	I Lots of under 1,000 lbs.	II Lots of 1,000 to 20,000 lbs.	III Lots of 20,000 lbs. or more
3. Obsolete scrap:			
Pure cable	8	9	9½
Old sheet and utensils (98% minimum aluminum)	7	8	8½
Old castings and forgings	6½	7	7½
Pistons free of struts	6½	7	7½
Pistons with struts	4½	5	5½
Old alloy sheets	5½	6	6½

4. Wrecked aircraft (prepared):

90% plus aluminum alloy content	7
70–90% aluminum alloy content	6
50–70% aluminum alloy content	4

Per pound of aluminum alloy recovered, irrespective of quantity.

5. Drosses, skimmings, grindings, sweepings, sawings, spatters:

50% plus aluminum	5½
Under 50%	4½

Per pound of aluminum contained, irrespective of quantity, as determined by fire assay or hydrogen evolution.

4. Wrecked aircraft (prepared):

90% plus aluminum alloy content	7
70–90% aluminum alloy content	6
50–70% aluminum alloy content	4

5. Drosses, skimmings, grindings, sweepings, sawings, spatters:

50% plus aluminum	5½
Under 50%	4½

Note 1. Meaning of terms. "Plant scrap" means scrap generated in the course of fabrication or manfacture and includes new material or parts rejected or discarded because defective, damaged in processing, part of surplus or idle inventory, or otherwise unfit for use. The mean plant scrap generated by shearing, clipping, cutting, blanking, or similar process, also defective or rejected wrought aluminum parts, defective or rejected castings, and gates, sprues, risers or similar foundry scrap. Scrap shall not be deemed "segregated", whether in the form of solids or in the form of borings, turnings or other machinings, unless it consists of one alloy only and is so identified and handled as to be accepted for reprocessing into aluminum of the original alloy specifications without the necessity for other than routine examination by the processor. The supplier must deliver to the buyer Segregation Certificate PD-706 showing alloy number and specification, and that scrap meets the specification. "Segregated low grade" scrap includes all alloys containing over 1% iron by weight (including free iron) except alloy PM 754.

"Segregated S-type alloy solids" consist of scrap generated from the wrought or S-type alloys such as 17S or 24S. All segregated alloy solids which are not low-grade or S-type are "high-grade."

Note 2: Iron, oil, moisture, etc. If borings, turnings and similar machinings or other grades of aluminum scrap contain oil, water or other forms of contamination, maximum prices may be paid only on basis of actual weight of aluminum or aluminum alloy contained. If aluminum or aluminum alloy content by weight is less than 85% of weight of material, buyer may only pay delivery charges on that portion of weight of material represented by weight of aluminum or aluminum alloy content.

Note 3—Quantity differentials—The requisite quantities for which premiums are provided in columns II and III, may consist of various grades of aluminum scrap, but other metals may not be included for the purpose of making up such quantities.

In computing the weight necessary to obtain a quantity differential, the actual weight of the material at the point of shipment, as determined by the public carrier, or as certified to and accepted by the public carrier, or as certified by a public weigher, is to be used. If the weight of the material at the point of shipment is not determined by any of the methods herein specified the actual weight of the material at the buyer's receiving point shall be used.

Note 4—Aluminum foil and light gauge aluminum sheet which does not exceed 0.006 of an inch in thickness is not considered within this regulation, but the provisions of the General Maximum Price Schedule shall apply.

Note 5: Wrecked aircraft (prepared): Maximum prices are for actual aluminum alloy content of ingot recovered by the buyer's first melt of the entire shipment. By mutual agreement of buyer and seller, 20% of shipment by weight may be used as representative sample in determining amount of aluminum alloy recovered. Where less than 10,000 pounds are received at one time the buyer may estimate the amount of aluminum alloy which will be recovered and make settlement on the basis of that estimate.

Note 6: Premiums for special preparation. Upon the sale of segregated solid aluminum plant scrap of any of the wrought aluminum or S-type alloys, except 2S and 3S, to the Aluminum Company of America, the Olin Corporation, or the Reynolds Metals Company, the following premiums may be charged, demanded, paid or offered.

	Premium (cents per pound)
Baled or packaged, for briquetting	½
Briquetted, or in large pieces too heavy to briquett	1

The above premiums may also be charged upon sale of segregated solid 17S, 24S, or 52S plant scrap to any other person if, but only if, the sale is made pursuant to a specific authorization or directive from the WPB, removing sale from restrictions of Order M-1-d.

Upon sale of wrecked aircraft, prepared, a premium of ½c per pound may be charged, if such scrap is baled by compression or briquetted.

GENERAL SUMMARY

Since the beginning of the war in 1939 expanding war-industries needs have been responsible for a continued stimulus in the production of steel ingots and castings; consequently, a new record has been established each year. Despite work stoppages which caused a production loss of 500,000 tons or more, 1943 was no exception, and steel output increased 3 percent over that in 1942; as a consequence, the use of ferrous scrap in steel-making furnaces rose 4 percent above the consumption in 1942, creating a new record. This occurred contrary to expectations that the expanded pig-iron-producing capacity would effect a reduction in the use of ferrous scrap, and it was a direct consequence of the superb effort of the scrap industry to maintain the flow of prepared scrap to consuming mills, despite virtual exhaustion of most of the natural sources of material for preparation. Pig-iron production increased 3 percent over that in 1942, and the use of this material in the manufacture of steel ingots and castings rose 4 percent. During the 12 months of 1943 scrap consumption was fairly stable, since steel-ingot production upon a monthly basis ranged from about 94 to 101 percent of capacity. The consumption of scrap reached a high point in October 1943, being surpassed only by October 1941—the all-time peak in scrap use.

The total consumption of ferrous scrap and pig iron in 1943 increased 2 percent over that in 1942. Charges to steel furnaces totaled 101,268,425 short tons; 19,376,729 tons were melted in iron furnaces, making a total of 120,645,154 tons that were remelted in the manufacture of steel and iron products. In addition, 1,320,961 tons of scrap were used in the production of ferro-alloys and for miscellaneous purposes, such as rerolling and chemical use, producing a new record for total consumption of ferrous scrap and pig iron—121,966,115 tons. In making the average ton of steel in 1943, less scrap and more pig iron were used than in 1942; the relative consumption of purchased scrap declined considerably in 1943 from 1942, whereas consumption of home scrap increased greatly. In iron furnaces, however, the relative use of total scrap increased while that of pig iron declined, owing to the inability of small foundry operators to obtain pig iron under allocation, which compelled them to use more purchased scrap. The imposition of certain limitation orders restricting the manufacture of cast-iron products for civilian purposes caused a general reduction in the use of ferrous scrap and pig iron in cupola furnaces throughout the country. Nevertheless, this diminution of consumption in cupola furnaces was more than offset by the increased use in the steel-making furnaces of the greatly expanded industry. Moreover, air-furnace capacity for the production of malleable iron, having been found to be inadequate to meet requirements, was enlarged by the construction of new plants, thereby assisting in counterbalancing the reduction in use by cupola-furnace operators.

---

[1] Minerals Yearbook, 1939, p. 513, gives definitions of the various scrap terms used in this report.

Prices for scrap were unaltered in 1943, remaining at the maximum levels established in 1941 by the Office of Price Administration. The quotation throughout the year for No. 1 Heavy-Melting steel scrap at Pittsburgh was $20 per gross ton ($17.86 a short ton), according to Iron Age, and No. 1 Cast Cupola scrap was quoted at the same level. The price of basic pig iron, established in December 1940 at $23.50 per gross ton ($20.98 a short ton) at Valley furnaces, prevailed throughout 1943.

Exports of ferrous scrap from the United States in 1943 were the lowest in many years, declining 61 percent from those in 1942. Several factors were combined to cause this large reduction—the high demand for and dwindling supplies of scrap, the Federal control of exports, and the need for shipping facilities to transport finished materials in preference to scrap.

Because of the continued high operating rate of the steel industry and the depletion of scrap reserves, dealers and brokers had considerable difficulty in maintaining the flow of much-needed scrap to the consuming mills, with scrap shipments declining steadily during the summer months. After the middle of the year, dealers depended more and more on industrial scrap to fill their orders, since collections from country points became increasingly difficult because of tire and gasoline rationing, and household scrap (usually gathered by peddlers) had practically vanished; also, salvage by automobile wreckers diminished rapidly. The decreased auto-wrecker salvage was due mainly to Conservation Order M-311, which, being designed to prevent the scrapping of serviceable automotive parts, naturally had a deleterious effect on the flow of scrap from automobile graveyards. A partial solution to the supply problem was anticipated by the return of battlefield scrap from overseas; but, contrary to the expectations of industry, which had been promised large tonnages of such material, very little had been received up to the end of the year, mainly because the time required for loading ships in foreign ports would have been too great.

All of the foregoing factors combined to produce a precipitate decline in inventories of purchased scrap, which were reduced over 600,000 tons throughout the year. However, in contrast to 1942, little alarm was expressed regarding the position of domestic stocks of iron and steel scrap. The survey of suppliers', producers', and consumers' stocks at the end of 1943 [2] indicated inventories of 7,175,500 short tons, equivalent to 6 weeks' supply at the average weekly rate of consumption during the year, as compared with stocks of 7,803,151 tons at the beginning of the year. Consumers' stocks of scrap decreased from 6,316,138 tons at the beginning of 1943 to 5,872,251 tons at the close. In contrast with the decline in scrap inventories, pig-iron stocks increased approximately 200,000 tons—from 1,454,665 tons on January 1 to 1,634,701 tons at the year end.

[1] Includes open-hearth, bessemer, and electric furnaces.
[2] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces; also direct castings.
[3] Revised figures.
[4] Includes rerolling, reforging, copper precipitation, nonferrous, and chemical uses.
[5] Iron Age.

Figure 1 shows the consumption of purchased scrap and the output of pig iron and steel ingots and castings from 1905 to 1943, inclusive.

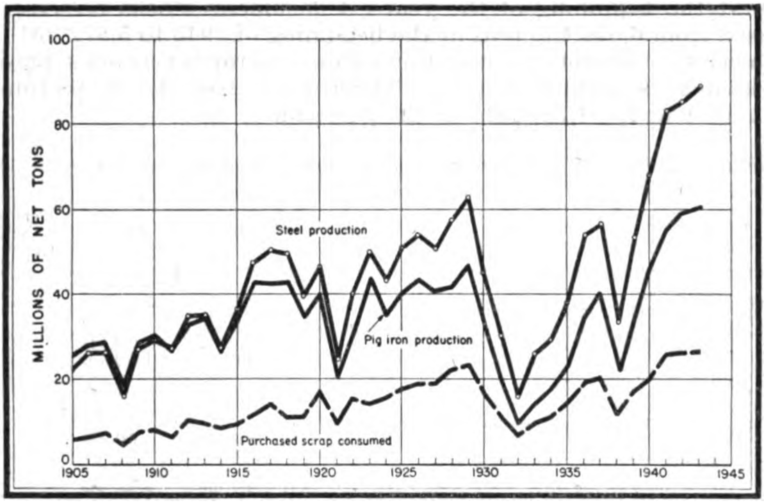

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–43. Figures on consumption of purchased scrap for 1905–32 are from *State of Minnesota vs. Oliver Iron Mining Co. et al.*, Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimates by authors; and those for 1935–43 are based upon Bureau of Mines reports. Data on output of pig iron and steel are as given by the American Iron and Steel Institute.

POST-WAR CONDITIONS

Requirements for iron and steel scrap are expected to decline sharply after the war. It has been estimated that production of steel ingots and castings will decline to 60,000,000 to 65,000,000 tons a year, a drop of nearly one-third from the war peak. The war-expanded pig-iron production capacity of the United States may greatly reduce scrap requirements if the increased ratio of pig-iron to scrap in steel-furnace operations remains unchanged after the war. The lessened requirements of scrap for the production of steel will be offset in part by an increase in scrap requirements for foundries as these plants resume the output of civilian products. Total requirements for iron and steel scrap will probably be greater than before the war. Post-war supplies of scrap, on the other hand, may increase greatly. Despite the great reduction in manufacturers' scrap following war-contract cancellations, the potential supply of purchased scrap may exceed requirements. Much of the scrap available after the war will be held by various Government agencies, either in the form of "in-process" or semifabricated material or as surplus war equipment and battlefield scrap. The orderly disposition of this material will greatly reduce the possibility of unbalance in the scrap industry.

PRICES [3]

Price Schedule 4, issued in 1941, establishing maximum prices for iron and steel scrap, later revised in February 1942 and entitled Revised Price Schedule 4, remained in effect throughout 1943, thereby maintaining scrap prices at a constant level, although steel-ingot production consistently approached 100 percent of rated capacity. Market quotations for both No. 1 Heavy-Melting steel and No. 1 Cast cupola scrap continued unchanged at $20 a gross ton ($17.86 per short ton) Pittsburgh.

---

[3] Pittsburgh price quotations from Iron Age.

The Office of Price Administration issued four amendments to revised Price Schedule 4 during 1943 that were designed mainly to assist the dealers financially and encourage the processing of scrap. Some of the changes were of a minor nature, such as the extension of certain basing points and creation of new remote areas. Of major importance to dealers was the change made in January, reducing the price consumers could pay for unprepared scrap; also, the amendment issued on December 13 permitting foundries to pay transportation charges to dealers' yards on cast-iron scrap originating in remote areas or allocated to them.

The price of basic pig iron, established at $23.50 per gross ton ($20.98 per short ton) at Valley furnaces late in December 1940, remained unchanged throughout 1943.

As the price of scrap exported from the United States was regulated by Revised Price Schedule 4, the export price structure remained firm during the entire year. However, export-scrap prices, as indicated by the declared value of iron- and steel-scrap exports, declined in 1943, averaging only $18.67 per gross ton ($16.67 per short ton) or approximately 20 percent lower than the 1942 average of $23.39 ($20.89).

LEGISLATION

No bills or resolutions of any nature regarding iron and steel scrap were introduced into the first session of the Seventy-eighth Congress. However, both the Office of Price Administration and the War Production Board, acting under Executive orders, issued amendments to previously instituted regulations, and introduced additional ones.

On March 24 an amendment to Supplementary Order M–21–a was issued, making it mandatory that each producer of alloy steel (including castings), except stainless and tool steel, should use alloy-steel turnings in specified amounts.

To conserve the supply of automotive parts the War Production Board, on May 20, issued Conservation Order M–311, which prohibited any person from scrapping, selling as scrap, or delivering as scrap certain used automotive parts, except when such part was "no longer serviceable." So that automobile wreckers could comply with this order, the Salvage Division of the War Production Board suspended the previously instituted agreement that required the owners of graveyards to scrap all cars within 60 days after they were acquired.

STOCKS

Available stocks of iron and steel scrap and pig iron in the United States at the end of 1943 were determined by the regular annual canvass of consumers of these materials and the monthly canvass of suppliers and producers. The final results of the annual survey indicate that on December 31, 1943, consumers', suppliers', and producers' stocks of iron and steel scrap totaled 7,175,500 short tons, which represents an 8-percent decline from the 7,803,151 tons on hand December 31, 1942. The largest part of this decline was directly attributable to the consistent decrease in inventories of cast-iron scrap, which diminished more than the total decline in stocks.

CONSUMERS' STOCKS

Consumers' stocks of home and purchased scrap were smaller at the end of 1943 than at the beginning of the year, indicating that despite the increased production of pig iron, iron and steel scrap was still important in establishing the new record for steel production. The supply of 1,668,103 short tons of home scrap on hand December 31 represented a 4-percent increase over the 1,605,756 tons on hand at the beginning of the year, while the supply of 4,204,148 tons of purchased scrap on hand at the end of 1943 was 11 percent smaller than the 4,710.,382 tons on hand at the beginning of the year. Thus, stocks of scrap totaling 5,872,251 tons at the year end were reduced 7 percent from the 6,316,138 tons on hand at the beginning of the year.

In contrast to consumers' stocks of scrap, inventories of pig iron totaling 1,634,701 tons at the year end had increased 12 percent from the 1,454,665 tons on hand at the beginning of the year. This increase in pig-iron stocks was undoubtedly created by the increased production facilities.

SUPPLIERS' AND PRODUCERS' STOCKS

Stocks held by dealers, automobile wreckers, railroads, and manufacturers declined from 1,487,013 short tons on December 31, 1942, to 1,303,249 tons on December 31, 1943. Thus, supplies of iron and steel scrap held by suppliers at the year end were over 12 percent less than those on hand at the beginning of the year. The entire decline in suppliers' stocks may be ascribed to decreases of 19 and 29 percent in inventories held by dealers and automobile wreckers, respectively, whereas railroad stocks were 32 percent larger at the end of 1943 than at the beginning, with supplies held by manufacturers increasing 13 percent during the same period.

Consumers' stocks of ferrous scrap and pig iron on hand in the United States on December 31, 1942, and December 31, 1943, by States and districts, in short tons

CONSUMPTION

In the canvass of consumers of ferrous scrap and pig iron in 1943, data were again assembled on the scrap used in miscellaneous operations, such as rerolling, reforging, and chemical uses, and for the production of ferro-alloys, in addition to that used in remelting processes. Statistics are compiled to show the consumption of scrap and pig iron by districts and States and by types of furnace. To avoid disclosing details concerning individual plants reporting, it is necessary in some instances to combine figures for some States. All such combinations are made with a view to revealing details of consumption by types of furnace rather than by geographic subdivision.

The importance of scrap in the conservation of resources can be illustrated by the relative quantities of scrap and ore used in the domestic iron and steel industry. The total scrap consumed in 1943 was equivalent to 126 percent of the iron content of all domestic and foreign iron and manganiferous ores used, as such, in blast furnaces, and purchased scrap alone equaled 54 percent of the iron content of the ores; in 1942 the comparable percentages were 114 and 51.

Scrap constitutes by far the greater part of the ferrous raw materials used in iron and steel plants in the New England, Southwestern, and Pacific Coast districts. These regions used only 6 percent of the total scrap consumed in 1943, the use of pig iron being less than 2 percent. The relative proportions of scrap and pig iron used in the United States in 1943 did not change from those in 1942. However, in two districts—the New England (a small pig-iron producing area) and the Middle Atlantic—proportionately more scrap was used in 1943 than in 1942, whereas in the remaining districts (Southeastern, Southwestern, North Central, Rocky Mountain, and Pacific Coast) proportionately less scrap was used. In six of the seven districts there was a definite decline in the proportion of purchased scrap contained in furnace charges, but in the other district (Rocky Mountain) no change occurred.

Open-hearth steel furnaces employ by far the largest quantities of ferrous scrap and pig iron, although in recent years the use of scrap has been steadily declining and the consumption of pig iron increasing. These furnaces consumed 65 percent of the total scrap in 1943 (66 percent in 1942), 73 percent of the home scrap (71 percent in 1942), 55 percent of the purchased scrap (59 percent in 1942), and 78 percent of the pig iron (77 percent in 1942).

In cupola furnaces, the second-largest consumers of scrap, the downward trend in the relative consumption of scrap and pig iron was again apparent. They used 10 percent of the home scrap in 1943 (12 percent in 1942), 17 percent of the purchased scrap (19 percent in 1942), and only 6 percent of the pig iron (8 percent in 1942).

Open-hearth and cupola furnaces together consumed 83 percent of the home scrap, 72 percent of the purchased scrap, and 84 percent of the pig iron in 1943.

Bessemer converters used 10 percent of the pig iron consumed in 1943 but only relatively small quantities of scrap (0.62 percent of the total). The increase in electric-furnace melting capacity during the year is revealed by the fact that this type of equipment consumed over 17 percent more scrap in 1943 than in 1942. Although furnaces of this nature use only a small part of the total scrap consumed, they took 11.2 percent in 1943, which represented a relatively large increase over the 9.8 percent consumed in 1942. Despite the fact that electric furnaces consumed only 11.2 percent of the total scrap used in 1943, they were important consumers of this material because almost 95 percent of the total charge to this type of equipment was home and purchased scrap.

Ferrous scrap and pig iron consumed in the United States and percent of total derived from home scrap, purchased scrap, and pig iron, 1942–43, by districts

[1] Revised figures.

[2] Includes some pig iron used in making direct castings.

[3] Where 2 or more separate departments, such as blast-furnace, open-hearth, foundry, etc., are situated at the same place and are operated by 1 establishment, each appears as 1 plant in the total.

CONSUMPTION BY DISTRICTS AND STATES

All 48 States, the District of Columbia, and Alaska contain plants that use ferrous scrap and pig iron, the greatest consumption being concentrated in the steel-making centers of the North Central, Middle Atlantic, and Southeastern districts. These areas include the 8 largest consuming States, which used 82 percent of the total scrap, 91 percent of the pig iron, and 86 percent of the total scrap and pig iron charged into furnaces in 1943; the percentages are unchanged from the comparable figures in 1942. The 8 States (the relative position of which varied only slightly from 1942) and the percentage of the total ferrous scrap and pig iron consumed in each in 1943 were as follows: Pennsylvania 29, Ohio 20, Indiana 11, Illinois 9, New York 5, Michigan 4, Alabama 4, and Maryland 4.

Despite the increased use of ferrous scrap and pig iron there were two districts (New England and Southeastern) in which the consumption of these materials declined, more especially in the New England area. This decrease undoubtedly was caused by the limitation orders imposed upon foundries, since the steel-industry expansion did not materially affect these regions.

Consumption of ferrous scrap and pig iron in the United States, 1939–43, by districts

CONSUMPTION BY TYPE OF FURNACE

Open-hearth furnaces.—Ferrous scrap and pig iron consumed in open hearths in 1943 totaled 87,321,326 tons—an increase of approximately 3 percent over 1942. This increase was made possible by the expansion of steel-making facilities during the year under the direction of the Defense Plant Corporation. Although electric-furnace capacity shared the expansion program, the major part of the tonnage was added to open-hearth capacity. Of the total scrap and pig iron used in open hearths in 1943, home scrap constituted 29 percent, purchased scrap 17 percent, and pig iron 54 percent. The use of purchased scrap decreased 8 percent, whereas the use of home scrap and pig iron increased 9 and 3 percent, respectively.

Charges to open-hearth furnaces in 1943 consisted of 46 percent total scrap and 54 percent pig iron, the proportions being unchanged from 1942. Of the total scrap consumed in open hearths in 1943, 37 percent was purchased scrap compared with 41 percent in 1942 and 40 percent in 1941. Higher proportions of scrap are used in areas remote from pig-iron-producing centers, but the practice of using scrap exclusively is relatively rare. In 1943 only 2 plants out of a total of 148 operated on a 100-percent scrap charge; they consumed only 87,337 tons, merely 0.1 percent of the total consumption of ferrous materials in open hearths.

Pennsylvania, the leading steel-producing State, outranked all others in 1943 in the consumption of ferrous scrap and pig iron in open hearths, followed by Ohio, Indiana, and Illinois.

Bessemer converters.—A total of 6,638,859 tons of ferrous scrap and pig iron was consumed in bessemer converters in 1943—a 2-percent increase over 1942. The proportion of scrap consumed in converter practice is low (amounting to only 5.7 percent in 1943), and the major portion was home scrap. Most of the small tonnage of purchased scrap consumed in converters was used in small steel-foundry plants.

As in the previous 2 years, Pennsylvania was the principal consumer of scrap in bessemer converters in 1943.

Electric steel furnaces.—The additional electric-furnace capacity resulting from the steel-industry expansion program was reflected by an increase in consumption of materials. Ferrous scrap and pig iron used in electric furnaces totaled 7,308,240 tons—a 22-percent increase over 1942. Of the 382 active plants reporting, 117 operated exclusively on scrap and consumed 1,051,653 tons—about 14 percent of the total scrap and pig iron used.

In 1943, as in 1942, Ohio led all States in the consumption of scrap in electric furnaces, followed by Pennsylvania, Illinois, Michigan, and California.

[1] Revised figures.

[2] Includes some pig iron used in making direct castings.

Cupola furnaces.—Consumption of ferrous scrap and pig iron in cupola furnaces totaled 11,606,904 tons—a 14-percent decrease from 1942. The use of home scrap declined 10 percent, purchased scrap 13 percent, total scrap 12 percent, and pig iron 20 percent. Again, the proportionate decrease in the use of scrap was less than that of pig iron, a circumstance undoubtedly due to the difference in price of the two materials and the inability of many small foundries to obtain pig iron under allocation.

Charges to cupola furnaces consisted of 31 percent home scrap, 38 percent purchased scrap, and 31 percent pig iron; in 1942 the percentages were 29, 38, and 33, respectively. Many cupola furnaces are operated on a 100-percent scrap charge; 421 plants reported the use of 674,973 tons of ferrous scrap without pig iron in 1943 compared with 509 plants that reported the use of 699,690 tons in 1942. However, the number of plants operating in this manner has been declining in recent years.

The relative position of States that are the principal consumers of scrap in cupola furnaces was altered in 1943 as compared with 1942. Michigan used the largest tonnage, followed in order by Ohio, Illinois, Pennsylvania, New York, and Wisconsin.

[1] Includes 3 Brackelsberg furnaces, 1 each in Indiana, Ohio, and Michigan.

Air furnaces.—Ferrous scrap and pig iron consumed in air furnaces in 1943 amounted to 1,767,330 tons—an increase of 4 percent over 1942. Although an increased production of malleable iron was indicated by this gain in ferrous materials used, the total furnace capacity was inadequate, and new malleable iron plants were under construction at the end of the year. As compared with 1942, the use of home scrap in air furnaces increased over 7 percent, purchased scrap 8 percent, and total scrap 8 percent; in contrast, the use of pig iron declined 3 percent.

Since 1940 no air-furnace operators have reported the exclusive use of scrap in charges to this type of equipment. There was no change in the relative position of the States that are the principal consumers of scrap in air furnaces. As in 1942, Ohio led in the use of scrap in air furnaces, followed in order by Illinois, Pennsylvania, Indiana, Michigan, Wisconsin, and New York.

Blast furnaces.—Ferrous scrap constitutes only a small proportion of the metal-bearing materials consumed in blast furnaces. Other materials used in 1943 were 96,819,571 tons of iron and manganiferous ores, 12,982,013 tons of sinter (produced from iron ore, flue dust, and other materials), 297,128 tons of pyrite cinder, 3,337,367 tons of mill cinder and roll scale, 3,392,178 tons of open-hearth and bessemer slag, 148,944 tons of raw flue dust, and 190,086 tons of other materials. Total consumption of scrap in 1943, as reported by 81 plants operating blast furnaces for the production of pig iron, was 3,567,948 tons—a 21-percent increase over 1942. Of the 1943 total 40 percent was home scrap and 60 percent purchased scrap; in 1942 the comparable percentages were 53 and 47. This direct reversal in the proportions of home and purchased scrap charged to blast furnaces occurred early in 1943, when a preponderance of lightweight scrap, such as turnings and borings, became available. The abundance of this material was caused by changes in manufacturing processes.

The downward trend in the ratio of scrap used to pig iron produced, manifest in 1942, was reversed in 1943 when it increased to 5.9 percent compared with 5.0 percent in 1942 and 5.3 percent in 1941. Purchased scrap was equivalent to 3.5 percent of the pig iron produced in 1943 compared with 2.3 percent in 1942 and 2.4 percent in 1941.

USE IN FERRO-ALLOY PRODUCTION

Consumption of iron and steel scrap in the manufacture of ferro-alloys totaled 376,519 tons—an 18-percent increase over the 318,125 tons used in 1942. Charges of scrap in ferro-alloy production consisted of 7 percent home scrap and 93 percent purchased scrap; no pig iron was reported as being consumed. Scrap was used for this purpose in 19 electric-furnace plants, 6 blast-furnace plants, and 2 aluminothermic-reduction-process plants. Of the total scrap used for ferro-alloy manufacture, 88 percent was charged to electric furnaces.

Iowa was the largest consumer of scrap in ferro-alloy production, followed by New York, Alabama, and Ohio.

MISCELLANEOUS USES

A substantial quantity of scrap is consumed each year in such miscellaneous uses as rerolling, reforging, flux in lead blast furnaces, and nonferrous-alloy manufacture and as a reducing agent in chemical processes. A total of 944,442 tons of ferrous scrap was used in these operations in 1943, representing only a slight decline from the 947,615 tons consumed in 1942. As with ferro-alloy production, the major part of the scrap consumed in miscellaneous operations was purchased scrap (93 percent). However, the use of home scrap increased 39 percent over that in 1942, while the use of purchased scrap declined 3 percent. The leading State in the use of scrap in miscellaneous operations was Illinois, followed in order by Pennsylvania, New Jersey, and Ohio.

FOREIGN TRADE [4]

Imports.—Imports of iron and steel scrap into the United States have never been exceptionally large, but because of augmented war demands they increased considerably in 1943, with the result that the usual trend was reversed, and imports were greater than exports. In 1943 such material imported totaled 145,252 short tons valued at $2,425,048 compared with 98,877 tons valued at $1,306,947 in 1942, an increase of 46 percent in tonnage. Of the 1943 total, 106,682 tons came from Canada, 16,991 tons from Cuba, 6,938 tons from the Panama Canal Zone, and the remainder from numerous other countries. In addition, 21,942 tons of tin-plate scrap were imported in 1943, largely from Canada, compared with 26,972 tons in 1942 and 25,312 tons in 1941.

Exports.—Ferrous scrap exports (all types) from the United States were the lowest in many years in 1943, being only 39 percent as large in tonnage and 32 percent as large in value as in 1942. However, this comparison does not fully indicate the tremendous decrease in exports since the beginning of the war. The decline can best be illustrated by comparing exports in 1943 with the average—3,298,326 tons per year—for the 5-year period (1935–39, inclusive) immediately preceding the war. A total of only 54,894 short tons valued at $1,070,809 was exported in 1943 compared with 141,736 tons valued at $3,321,523 in 1942. This indicates that exports in 1943 were less than 2 percent as large in volume as the pre-war average. The extremely low exportation of scrap in 1943 was caused by several factors, including the continuance of export licensing established in 1941 and the enduring high demand for scrap in the United States. The shipments in 1943 included 1,949 tons of tin-plate scrap, waste-waste tin plate, tin-plate circles, cobbles, and similar material, as well as terne-plate clippings, all valued at $188,460. In 1942 exports of this type of scrap totaled 5,196 tons valued at $469,458. The following table shows the principal countries to which scrap was exported during the 5-year period 1939–43.

WORLD ASPECTS

Statistics on the production of steel and pig iron, and consequently on the use of iron and steel scrap, during 1943 are not available, as publication of information has been suspended in many of the countries involved.

REVIEW BY COUNTRIES

Canada.[5]—Steel ingot and casting production in Canada in 1943 did not equal the record of 3,121,000 short tons established in 1942, declining 4 percent to 2,997,000 tons. In the production of steel, 1,515,000 tons of pig iron and 1,804,000 tons of iron and steel scrap were used, resulting in a ratio of 46 percent pig iron to 54 percent scrap, which indicates a change in melting practice from 1942, when the proportions were 47 percent pig iron and 53 percent scrap. This change was brought about entirely by the use of more home or revert scrap, since the scrap charge contained 55 percent home scrap and 45 percent purchased scrap, whereas in 1942 the proportion of home scrap in the total scrap charge was only 49 percent, with purchased scrap representing 51 percent.

Pig-iron production in 1943 did not reach the high level attained in 1942, declining more than did the manufacture of steel; it totaled only 1,758,000 tons compared with the record of 1,975,000 tons in 1942, a decrease of 11 percent. Slightly more than 111,000 tons of scrap were used in the manufacture of pig iron in 1943.

At various times during the year fears were expressed that a shortage of scrap might develop, as mills were forced to draw heavily on their surplus stocks to meet requirements, when outside sources of supply could not maintain adequate shipments.[6] Notwithstanding the apprehension felt by some regarding the critical scrap supply, the majority of mills were confident that the increased pig-iron capacity would suffice to replace scrap. Inasmuch as the Canadian Government was alarmed, in the early part of 1943, concerning a probable serious shortage of scrap, action was taken to begin nation-wide salvage campaigns earlier than in previous years, with the anticipation that the salvage record established in 1942 would be improved.[7] Despite these efforts collections fell far below expectations both from the rural districts as well as from mining areas;[8] and in addition, comparatively little scrap was received from automobile wrecking yards. This decline in collections of scrap and the relatively high demand for it created a problem toward the end of the year, since stocks in the yards of dealers were very low; and although mills had established fair stockpiles, inventories of scrap were only approximately half as large as on January 1.[9]

[8] American Metal Market, vol. 50, No. 229, December 2, 1943, p. 7.

On March 5, 1943, the Steel Controller issued Order SC 25, which provided for the federal licensing of certain dealers; on March 6 Order SC 27 was issued, establishing maximum prices for cast-iron scrap in Ontario and Quebec and for steel scrap in Ontario, Quebec, and the Maritime Provinces.[10] During May, in order to induce larger importation of scrap, the Finance Minister announced the removal of the 10-percent war-exchange tax previously imposed on imports of cast-iron scrap to be remelted for use by Canadian industries.[11]

United Kingdom.—Scrap continued to be a significant factor in the manufacture of iron and steel in the United Kingdom in 1943, especially since the record-making production of the previous year was maintained. The lack of imports was counteracted by a licensing system [12] previously instituted, whereby steel works were assured of receiving fairly regular deliveries of scrap derived from salvage drives, which had succeeded in increasing collections to over 100,000 tons a week.[13] By means of this licensing system deliveries of scrap were maintained at a level that supported capacity steel production,[14] however, less heavy scrap was being shipped than previously, which indicated the need for reliance on lighter grades.

The scrap industry was confronted with a shortage of labor suitable for the preparation of scrap, in addition to the problem of the disposition of steel turnings. Notwithstanding labor shortages and discontinuation of imports, the success of the drive for mobilization of the nation's scrap resources was reflected in the substantial stock piles of iron and steel scrap that were accumulated.[15] Under the scrap-salvaging plan scrap piles were maintained in strategic places as long as possible to serve as constant reminders to the public that the drive is a continuous one and that they were reservoirs to be used by industry. To augment these stock piles it was proposed, in the latter part of 1943, to strip 250,000 old automobiles of reusable parts and then break them up for ultimate use in war weapons; from these cars the automobile wreckers anticipated the salvage of a substantial tonnage of iron and steel scrap.[16] The program for compulsory collection and segregation of domestic scrap by local authorities was ordered to be relaxed after December 31, 1943, so that only those equipped to process the material into a state suitable for ready utilization would be included. This step was taken because large amounts of household scrap had been amassed, such as tin cans and discarded household utensils—a type of material that is bulky and expensive to treat and transport.[17] Thus, it is readily discernible that the scrap position was more favorable than it had been since the early days of the war, and as the drives for iron and steel scrap had been so successful any fears of a shortage of supplies were dispelled, at least for the present.

To segregate essential alloy-steel scrap more effectively, the Controller of Iron and Steel devised a color scheme to be used by producers and dealers for identifying various types of alloys. This was done because large amounts of valuable alloys were lost each week in steel mills on account of poor segregation at the producing source.[18] Then in July the Controller issued a new order to all alloy-steel ingot makers to standardize compositions, the primary purpose being to conserve the use of alloys; they were also directed to use more alloy-steel scrap to reduce the consumption of virgin metals.[19]

GENERAL FEATURES IN 1943

The domestic iron-ore industry in 1943 was featured by record demand, but shipments were hampered by an unusually late opening (April 28) of the Great Lakes shipping season, unfavorable shipping weather during the season, and several Lake shipping accidents; in consequence total production and shipments decreased 4 and 6 percent, respectively. However, estimated requirements declined during the year as a result of some tapering off of pig-iron demands and certain delays in completing blast-furnace capacities, and at the end of 1943 consumers and lower Lake stocks were adequate in both quantity and distribution to meet the 1944 season comfortably. At the beginning of the Lake shipping season the War Production Board had announced a goal of 95,000,000 gross tons[2] to be shipped down the Lakes, in addition to 2,000,000 tons all-rail. This quantity was based upon estimated requirements of existing blast furnaces and new capacity to be added during 1943. With the difficulties encountered in moving ore on the Lakes during the year, the required goal was gradually reduced to 86,500,000 tons.

Added to the troubles of the iron-mining industry in 1943 was a severe manpower shortage, especially in the northeastern district where it held production down virtually to the pre-war level.

The new MacArthur lock at Sault Ste. Marie was completed and opened to commerce on July 11, 1943. This lock is the largest of the five now completed and is 879 feet long, 81 feet wide, and 31 feet deep. The new emergency loading dock at Escanaba, Mich., which was started in 1942 was abandoned in 1943 after the timber construction was completed but before any steel work had been started. It would be relatively easy to install tracks and put the dock into operation should this added capacity become necessary.

---

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[2] The iron-ore industry has expressed a preference for the gross-ton unit (2,240 lb.), which will be used in this chapter. However, the chapter Pig Iron, Ferro-Alloys, and Steel in 1943 will continue to present data in net tons (2,000 lb.), the preferred unit in those industries.

Price regulations.—The quoted price of Lake Superior iron ore did not change during 1943. However, on December 15, a regulation was issued by the Office of Price Administration which permitted concerns to sell iron ore at the ceiling price of $4.45 per gross ton at lower Lake ports for Mesabi non-Bessemer ore. As iron ore is normally sold below the quoted price, the actual selling price had averaged around $4.30 since the shipping season of 1941. In effect, the use of the escalator clause permitting changes in iron-ore prices during the year in keeping with costs variations had been resumed. The increase was necessitated by rising production costs—particularly higher labor expenses—and applied to all ore shipped down the Lakes during 1943, on which accounts are settled at the season's closing.

A temporary 8-percent increase in Lake transportation rates was authorized by Office of Price Administration for the period August 31 to December 31. The rates had previously been frozen by the General Maximum Price Regulation of March 1942.

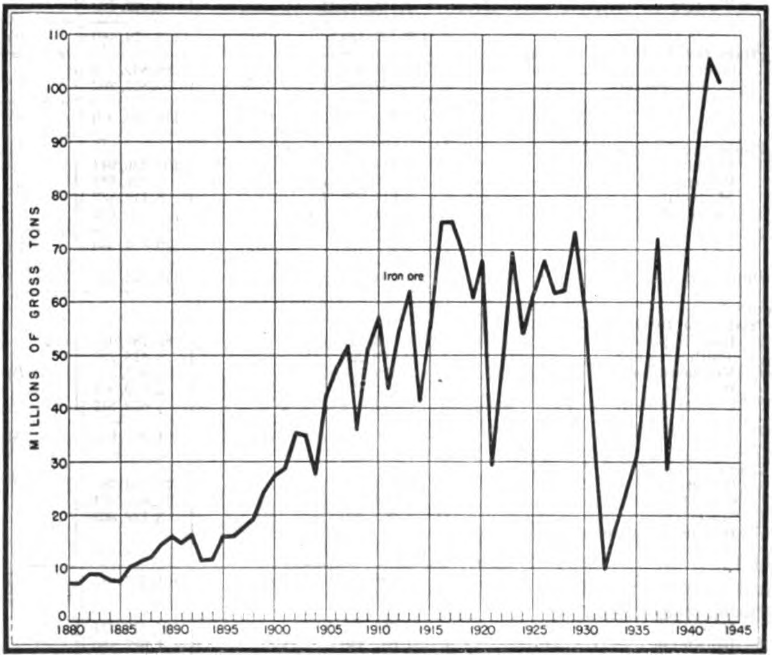

FIGURE 1.—Trends in production of iron ore in the United States, 1880–1943.

POST-WAR OUTLOOK

Iron-ore production in the post-war years will be considerably above pre-war levels but substantially below current rates. As usual, output will be geared to post-war steel activity, on which opinions vary sharply. Pent-up demands for civilian consumer goods, reconversion, and new construction justify the assumption that there will be a brisk demand for steel for several years following the war. That this demand will require continuation of the wartime rate of steel production of nearly 80,000,000 gross tons (90,000,000 net tons) a year seems unlikely. On the other hand, return to the pre-war average of approximately 46,500,000 tons is likewise not indicated. A 54,000,000-gross ton (60,000,000 net tons) steel rate, which seems reasonable, would require 70,000,000 gross tons of iron ore a year compared with 46,318,239 tons in the 5-year period 1935–39 and 73,027,720 tons in 1929.

No significant changes in sources of iron ore are anticipated. The Lake Superior and Birmingham districts will continue to supply most of the ore required for the production of pig iron, although the

Northeastern States and possibly the Western States will supply a somewhat larger proportion than heretofore. Foreign trade in iron ore will continue small in comparison with the domestic trade. Imports from South America and Cuba will be resumed and those from Canada probably increased.

Research on the beneficiation of low-grade ores, which has been under way for a number of years, was expanded in 1943. Additional emphasis on this problem may be expected after the war, not only to provide new sources to replace the high-grade deposits now being rapidly depleted but also to assure ample supplies of iron ore for future emergencies.

During the past few years the unprecedented demand for ore was met largely by stepping up production in the large open-pit mines, where increases in output can be realized much more rapidly and with less manpower than in underground mines. As these open-pit mines will soon be exhausted some alternate means for meeting emergency requirements must be devised.

Several proposals have been made to achieve this objective. It has been suggested that open-pit production should be restricted and the deposits held in reserve for emergency use. Another proposal calls for no interruption to open-pit mining and provision for large stock piles of ore for future peak needs. Stock-pile acquisitions through Government purchase of submarginal ores have been suggested as a means of developing new sources and conserving marginal ores in active mines that might otherwise be lost permanently. Although decisions on national policy regarding this important subject have not yet been arrived at, it is evident that the lower-grade iron-ore resources of the United States will receive increasing attention in the post-war years.

Conservation of high-grade deposits and concomitant development of low-grade iron ores are discouraged by the present tax policies of some States. Proponents of the plan point out that the burden of taxes on unmined reserves must be lifted or greatly reduced so that operating companies may be financially able to defer large-scale mining of these ores. A step in this direction was taken by the Minnesota legislature in 1943, when it reduced the ad valorem tax on taconite reserves.

PRODUCTION AND SHIPMENTS

United States iron-ore mines produced crude ore totaling 119,674,980 gross tons and shipped 118,622,412 tons in 1943—decreases of 5 and 6 percent from 1942. Of the 1943 shipments 34 percent was sent to beneficiation plants, and 66 percent went direct to consumers, compared with 35 percent and 65 percent in 1942. From the crude ore shipped to beneficiation plants, 17,622,674 tons of concentrate and 3,138,863 tons of sinter were produced. In addition, 652,513 tons of byproduct cinder and sinter were produced from the pyrite industry. In all, 100,595,322 gross tons of usable iron ore were produced at mines and mills in 1943. Output came from 287 mines, of which 25 mined over 1,000,000 tons of crude ore each. Minnesota with 69,084,907 tons supplied 69 percent of the usable ore, and Michigan with 15,425,788 tons or 15 percent was the second-largest producer. These two States and Wisconsin with 1,498,749 tons or 1 percent constitute the Lake Superior region (disregarding a small

PRINCIPAL MINES

In this discussion, the size of a mine is determined by the quantity of crude ore excavated. Consequently, mines providing low-grade ores, which require concentration, will be comparable in size to mines producing similar quantities of direct shipping ores. Twenty-five mines, each yielding more than 1,000,000 gross tons of crude ore, produced 52 percent of the United States output in 1943. Of these producers, 18 were in Minnesota, 3 in Alabama, 2 in New York, and 1 each in Wisconsin and Pennsylvania; 15 were open-pit operations, 7 underground, and 3 combination mines. Except for 3 mines that produced magnetite, all the million-ton mines produced hematite.

Iron-ore mines in the United States in 1943, by size of crude output

---

[1] Excludes an undetermined number of small pits. The output of these pits is included in the total given.

BENEFICIATION

Iron ore is concentrated by washing, jigging, and magnetic and high-density separation to remove objectionable impurities, thereby improving the grade of ore. Fine ores are agglomerated or sintered into lumps, which are desirable in blast and steel furnaces because of their porous character and their improved grade and structure. Sintering likewise has the beneficial effect of reducing the sulfur and moisture content. At many mines the ore is crushed and screened to improve its physical characteristics, but ore known to be so improved is not included in the statistics on beneficiated ore.

In 1943 a total of 20,761,537 gross tons of beneficiated ore was produced from 40,199,797 tons of crude ore. Beneficiation of iron ore was reported at 132 mines in nine states in 1943 compared with 120 mines in nine States in 1942. Beneficiated ore shipped from domestic mines in 1943 decreased 12 percent from 1942; concentrates comprised 17 percent and sinter 3 percent of total usable ore shipments.

The production of beneficiated ore, concentrates, and sinter in 1943 decreased 10 percent from 1942, chiefly owing to efforts of companies in the Lake Superior district to ship as large a tonnage of direct shipping ore as possible, thereby meeting shipping quotas with a minimum of manpower output. The ratio of crude ore used to usable ore produced was 1.936:1 in 1943 compared with 1.927:1 in 1942.

The beneficiation of low-grade iron ores aroused increased interest during the year, as various operating companies started individual and cooperative research, in addition to programs which have been under way for a number of years. Interest centered primarily on the low-grade ores, including taconite, in the Lake Superior district (see review of Lake Superior District). The magnetic taconites at the eastern end of the Mesabi range are easier to separate than the bulk of the ore which is nonmagnetic and requires a special roasting process. The iron oxide contained in both types is finely divided, necessitating fine crushing.

Experimental work is not only being conducted with regard to magnetic separation, but efforts are also being continued to improve the high-density or heavy-media method, which originated with the Chance process for sand flotation of coal in 1931. In 1936–37 the first iron and manganiferous iron ores were successfully treated by this technique at the Mines Experiment Station, University of Minnesota. Since that time the high-density treatment of iron ore has supplied a small quantity of hematite concentrates annually.

Preparations were under way in 1943 for the first commercial high-density concentration of brown ore. The Merritt plant on the Mesabi range has been dismantled to be reerected at the Scotia mine, Pennsylvania, for this purpose. This operation is scheduled for production in 1944.

Heavy-media separation processes are described in a paper[3] published by the American Cyanamid Co., in 1943.

The briquetting of soft iron ore attracted attention during the year as a patent was granted covering a process for the preparation of soft ores for satisfactory furnace use. In steel furnaces briquets are designed for use as a substitute for lump ore, either for charging or finishing. In blast furnaces briquets would lower dust losses, permit easier flowage of furnace gases, and generally provide a more acceptable burden in contrast to soft ores. Although briquetting is not common, it has been done to some extent in the past. With regard to Carnegie-Illinois practice, Reinartz[4] has stated:

---

[3] American Cyanamid Co., Heavy-Media Separation Processes, Fine Ore Concentration: Ore Dressing Notes, No. 12, August 1943, 16 pp.

> We have for years briquetted soft ore in a jarring machine by the use of 2 percent or less of cement as a binder. We then burn these briquets for 20 to 30 minutes in the open-hearth furnace at the time of charge to remove the combined moisture.

Statistics covering production of iron-ore briquets are not available.

Iron ore shipped from mines in the United States, 1925–29 (average) and 1939–43, in gross tons, and percentage of beneficiated ore compared to total shipped

[Exclusive of ore containing 5 percent or more manganese and ore sold for paint]

Year	Beneficiated	Total	Proportion of beneficiated to total (percent)	Year	Beneficiated	Total	Proportion of beneficiated to total (percent)
1925–29 (av.)	8,653,590	66,697,126	13.0	1941	19,376,120	93,053,994	20.8
1939	9,425,809	54,827,100	17.2	1942	[1] 23,104,945	[1] 105,313,653	21.9
1940	12,925,741	75,198,084	17.2	1943	[1] 20,117,685	[1] 98,817,470	20.4

[1] Includes ore for paint.

SINTER

Domestic sintering plants in 1943 used 10,362,946 gross tons of iron ore, 5,188,555 tons of flue dust, 286,876 tons of mill cinder and roll scale, 648,592 tons of pyrite cinder (including a small quantity of flue dust and iron ore not separated), and 15,756 tons of manganese-bearing ore to produce 14,467,018 tons of sinter—a yield of 88 percent.

Sinter production in 1943 came from plants at mines, blast-furnace plants, custom mills, and a number of rotary cement kilns converted to iron-ore roasting. Of the sinter produced in the United States in 1943, 22 percent was made at mine plants in 4 States, and 78 percent was produced at blast-furnace plants and custom mills in 16 States. In addition, a number of other sintering plants were under construction and are expected to be in production in 1944. Total sintering capacity on July 1, 1942, was listed at 14,617,000 tons; wartime expansion will raise capacity to 23,826,000 tons. Agnew[5] has described the development, use, process, and plant design, with regard to sinter production. Thyrre[6] has described the use of rotary kilns for the agglomeration of ores. A bibliography covering the sintering of iron ore and blast-furnace flue dust has been prepared by Filar.[7]

[1] Included with average for all States.

[2] Includes Arizona, Texas, Utah, Virginia, Washington, and Wyoming in 1942, and these States plus Arkansas, Colorado, South Dakota, and California in 1943.

[3] Cinder and sinter obtained from pyrite treated in, but not necessarily mined in, States indicated.

States or groups of States, except when there are fewer than three shippers of a certain class of ore in a State and permission was not given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately, as not all reports are comparable. Some evidently include mining costs only; others contain, in addition, the cost of selling and insuring the ore; others include an allowance for a sinking fund; and still others comprise only costs charged against blast furnaces. None of the reports, however, is supposed to include freight charges.

CONSUMPTION

A total of 100,273,451 gross tons of metallurgical iron ore was reported consumed in 1943. Of this, 85 percent was consumed in iron blast furnaces, 10 percent in sintering plants, 4 percent in steel furnaces, and 1 percent in ferro-alloy furnaces. The 183,538 tons of miscellaneous ore shipped from mines and mills in 1943 were assumed to have gone directly into consumption.

The tables giving consumption of all metalliferous materials in the production of pig iron, formerly included in this section, will be found in the chapter Pig Iron, Ferro-Alloys, and Steel.

Consumption of iron ore in the United States, 1943, by States and uses, in gross tons

[1] Shipments from domestic mines.

[2] Exact consumption in Minnesota not known; estimated equal to sinter production.

STOCKS OF IRON ORE

Stocks of iron ore at mines on December 31, 1943, increased 54 percent from 1942. Of the quantity in stock piles, 52 percent was at mines in Michigan, 36 percent in Minnesota, and 5 percent in

Wisconsin—a total of 93 percent at mines in the Lake Superior district.

Stocks of crude ore at mines totaled 3,934,316 gross tons on December 31, 1943, compared with 2,674,606 tons in 1942.

Stocks of iron ore at consuming plants totaled 38,337,616 gross tons on December 31, 1943, compared with 40,766,573 tons at the end of 1943. The decrease was the result of the decreased Lake shipments during the 1943 season. The distribution of stocks at the end of 1943 was more favorable than in the previous year as a result of informal allocation of 1943 shipments to assure satisfactory stocks at all consuming plants to meet the 1944 shipping season.

Stocks of iron ore at mines, December 31, 1942–43, by States, in gross tons

State	1942	1943	State	1942	1943
Alabama	29,507	24,833	New York	55,337	310,122

[1] Includes pyrite cinder.
[2] United Kingdom of Great Britain and Northern Ireland.

Exports of iron ore from the United States in 1943 totaled 2,424,801 gross tons valued at $8,117,156 ($3.35 a ton) compared with 2,515,388 tons valued at $8,114,586 ($3.23 a ton) in 1942. Of the total quantity of iron ore exported in 1943 Canada received 2,424,738 tons, Mexico 50 tons, Colombia 10 tons, and Australia 2 tons.

REVIEW OF LAKE SUPERIOR DISTRICT

Production and shipments.—Production of iron ore from mines in the Lake Superior district in 1943 was 6 percent lower than in the record year 1942 and supplied 85 percent of the Nation's output compared with 87 percent in 1942. The Mesabi was again the largest of the six producing ranges, supplying 76 percent of the district total and 65 percent of the United States total. The Lake Superior iron-ore data do not include 1,433,166 tons of ore containing 5 percent and more manganese.

The Lake Superior Iron Ore Association reported 83,946,827 tons of iron and manganiferous ore shipped down the Great Lakes from United States ports in 1943—a decrease of 8 percent from 1942. All-rail shipments, which totaled 2,015,341 tons in 1943, were made to blast furnaces for use in making pig iron and to industrial plants for paint, sashweights, and ballast.

Before the season opened the War Production Board set a quota of 95,000,000 tons of ore to be shipped down the Lakes in 1943. It was hoped that additions to the fleet would permit this goal to be reached. However, this quota was subsequently revised downward to 86,500,000 tons because of several contingencies. The 1943 season did not get underway on Lake Michigan until April 4, when the first loaded ore carriers left Escanaba, whereas in 1942 ore shipments started from Escanaba on March 23. The first ore carrier passed southward through the locks at Sault Ste. Marie on April 28, 1943—about a month later than in 1942. Shipments during the first few weeks of the season were retarded by heavy fogs and rain. Collisions sunk two ore carriers, and several others were damaged. Sixteen new maritime vessels were added to the fleet during the season; however, most of these were completed behind schedule. In both 1942 and 1943 the last shipments of ore were made early in December. At the end of the season the United States ore fleet comprised 319 vessels having a trip capacity rated at 2,984,490 tons (at 20 feet draft); 28 Canadian vessels were also in the ore trade.

Iron ore produced in the Lake Superior district, 1854–1943, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more maganese]

Year	Marquette	Menominee	Gogebic	Vermilion	Mesabi	Cuyuna	Total
1854–1941	213,048,628	191,272,379	225,607,448	70,520,400	1,178,414,192	27,987,266	1,906,850,313
1942	6,324,307	4,808,866	5,993,575	1,935,125	70,287,664	1,655,484	91,005,021
1943	5,680,727	5,366,595	5,877,215	1,782,237	65,334,939	1,747,304	85,789,017
Total	225,053,662	201,447,840	237,478,238	74,237,762	1,314,036,795	31,390,054	2,083,644,351

The new MacArthur lock was opened to ore traffic on July 11. This is now the largest lock at Sault Ste. Marie and should prove a valuable addition to the Great Lakes waterway.

Construction was started on a new emergency loading dock at Escanaba, Mich., in 1942, but was abandoned in 1943. Structural timber work was completed early in the year; however, track and chutes were not provided. Enough was accomplished to enable the dock to serve in an emergency, for it should be a relatively easy task to install necessary facilities when completion seems advisable.

Mining developments.—Three large new strip mines on the Mesabi range were developed during the year—the Embarrass, Longyear, and Columbia. However, only the Columbia, operated by the Interstate Iron Co., was able to ship ore in 1943. The Evergreen Mines Co. constructed two new beneficiation plants during the year. A washing plant built at the Buckeye mine on the western side of the Mesabi range has a daily capacity of 4,000 tons, and another of 3,000 tons capacity was constructed at the Douglas mine. Milling equipment for these plants came from Evergreen's Draper mine. The draining of 2 billion gallons of water from the Fayal mine at the Oliver Iron Mining Co., a subsidiary of the United States Steel Corporation, was started during the year in preparation for production during 1944. This mine, which has not been worked since 1933, is estimated to contain 8,026,038 tons of unmined ore. The Oliver Iron Mining Co. brought the Mountain Iron mine into production after 34 years of inactivity. A new ore producer on the Menominee range in 1943 was the Book open-pit mine, operated by the North Range Mining Co. At the Republic Steel Corporation Susquehanna mine on the Mesabi range, new 15-ton trucks were put into use to remove surface and rock stripping. These trucks eventually will be used to transport ore, replacing the electric haulage system now in use at the pit. Preparations were being made to install a crusher and belt-conveyor system at this mine. The new Mather mine, operated by the Cleveland-Cliffs Co., on the Marquette range, came into production in 1943. A 30-inch ventilation borehole was drilled to a depth of 1,000 feet at the Sherwood mine, and a 66-inch shot-drilled ventilation hole at the Cary was down to about a 2,000-foot depth at the end of the year. This latter hole will be completed at 2,585 feet and eventually will be enlarged to make a hoisting shaft. The Davidson No. 2 mine of the Pittsburg Coke & Iron Co. became exhausted in April 1943 after 33 years of production.

Average costs, per gross ton, of mining iron ore at underground mines and at siliceous open pits in Michigan in 1943 [1]

Item	Underground				Siliceous open pits
	Gogebic	Marquette	Menominee	Average	
Cost of mining:					
Labor	$1.2716	$1.5658	$1.1942	$1.3504	$0.2842
Supplies	.5953	.6193	.5667	.5937	.2614
Deferred costs	.2232	.0496	.1348	.1282	.0446
Taxes	.2185	.1783	.0989	.1607	.0614
General overhead	.1887	.2056	.1617	.1903	.1137
Transportation	1.8890	1.5898	1.6486	1.7032	1.5733
Marketing	.0610	.0968	.0804	.0813	.0871
Total ore cost	4.4473	4.3052	3.8853	4.2078	2.4257
Lake Erie value per ton	4.7745	4.6558	4.3633	4.5877	2.3540
Gross ore profit [2]	.3272	.3506	.4780	.3799	−.0717
Other costs:

[1] Pardee, F. G., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., 1944, 9 pp.

[2] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

Analyses.—The following table was compiled by the Lake Superior Iron Ore Association.

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron-ore from all ranges of Lake Superior district, 1939–43

Year	Gross tons	Iron (natural)	Phosphorus	Silica	Manganese	Moisture
		Percent	*Percent*	*Percent*	*Percent*	*Percent*
1939	44,983,754	51.75	0.085	8.27	0.76	10.73
1940	63,308,413	52.09	.085	8.00	.77	10.93
1941	79,941,240	51.83	.085	8.18	.78	11.01
1942	92,069,902	51.65	.089	8.21	.79	10.98
1943	85,116,347	51.58	.091	8.32	.82	11.06

Stocks at Lake Erie ports.—On December 1, 1943, just before navigation stopped, the Lake Superior Iron Ore Association reported 6,393,581 tons of iron ore at Lake Erie ports compared with 7,151,439 tons on the same date in 1942. At the opening of the 1944 season (May 1, 1944), 2,906,827 tons of ore were in stock at these ports compared with 2,814,990 tons on May 1, 1943. Withdrawals from stocks during this 5-month period in 1943–44 were 20 percent less than in 1942–43.

Prices of Lake Superior ore.—The prices established April 17, 1940, for the four standard grades of Lake Superior ore remained unchanged. Since that date the prices of the various grades quoted at Lake Erie ports for a long-ton unit were as follows: Old-Range Bessemer, 9.223 cents; Mesabi Bessemer, 8.932 cents; Old-Range Nonbessemer, 8.932 cents; and Mesabi Nonbessemer, 8.641 cents; respectively, $4.75, $4.60, $4.60, and $4.45 a gross ton. The base of the four standard grades for 1925–43 is an iron content of 51.50 percent natural. For the Bessemer grades, the allowable phosphorus content is 0.045 percent (dry), and for the nonbessemer grades the phosphorus content ranges from 0.045 to 0.18 percent. Ores containing more than 0.18 percent phosphorus are classed as high-phosphorus ores, whereas those containing 18 percent or more silica are classed as siliceous ores.

Reserves.—Considerable interest in low-grade iron ores was shown during the year by several Minnesota operating companies. Within the past few years, apprehension over the rapid decline of their ore reserves has prompted various companies to compete in the leasing of State and privately owned lands containing these low-grade ores. Other deposits of high-grade ore, which are small and costly to mine, attracted the attention of the operating companies. When the State offered land in June 6, 1943, 10 of the parcels bid for were lake-bed sites. Of 6 lake-bed prospecting permits issued, 5 were taken by the Evergreen Mines Co. Action on 4 others, the principal one of which was underlying Rabbit Lake, was held up pending settlement between the State and owners of the claimed riparian rights.

During the year the Minnesota State Legislature assisted the iron-ore industry by reducing the ad valorem tax on taconite properties. At the instigation of iron-range legislators, a tax of $1.00 per acre was levied on taconite reserves. When the taconite is mined and concentrated to a usable iron content, a tax will be placed on the concentrate produced. The rate will be determined by the iron content of the concentrate and will average about 6 cents per ton.

Iron-ore reserves in Michigan, January 1, 1940–44, in gross tons

Range	1940	1941	1942	1943	1944
Gogebic	37,160,900	31,603,731	30,073,528	32,901,951	32,791,848
Marquette	49,573,794	48,370,114	48,306,120	50,991,701	49,652,024

[1] Revised.

Prospecting.—Some prospecting was accomplished during the year, although most companies, particularly those operating underground mines, were forced to let their development programs fall behind as they concentrated upon production. Pennsylvania oil-drilling derricks were used by the Cleveland-Cliffs Iron Co. for deep core drilling on the Marquette range. Underwater deposits in the Lake Superior district continued to be drilled through the ice during the winter; at Pickands Mather's Rabbit Lake reserve 7,200,000 tons of ore were measured by this method. During the year the Federal Bureau of Mines drilled and trenched deposits on the Gogebic and Marquette ranges.

Research.—A research program sponsored by 12 iron and steel companies was started in 1943 in an effort to find a commercial method of beneficiating low-grade Lake Superior ores. The program, which is being conducted by the Battelle Memorial Institute, will cost about $50,000 annually. The problem of treating taconites and other low-grade ores economically has long been studied at the Minnesota Mines Experiment Station. Independent research on the same problem is being conducted by several companies, including the Oliver Iron Mining Co. and the Pickands Mather Co. The latter company constructed a laboratory and testing plant at Hibbing, Minn., and the Oliver Iron Mining Co. established a laboratory in Duluth. In addition, the research department of the United States Steel Co. has conducted a long-range experimental program for the past 8 years with a view toward conserving natural resources by increasing the use of low-grade iron ore.

MINING BY STATES

Alabama.—Iron-ore production in Alabama during 1943 decreased 9 percent from 1942, principally because of coal strikes, which caused a reduction of pig-iron output at Alabama blast furnaces and thereby lowered the demand for iron ore.

The Red Mountain group of mines—the Ishkooda, Muscoda, and Wenonah—operated by the Tennessee Coal, Iron & Railroad Co. were the largest producers in Alabama during 1943. These underground mines produced hematite, some of which was sintered before consumption, the rest being shipped direct to furnaces. Sinter was also produced at the Republic Steel Corporation's Spaulding mine. Hematite from this mine was concentrated and mixed with pyrite cinder from Virginia and other materials before being sintered. Sinter produced from materials other than iron ore has been excluded from Alabama statistics but has been credited to sinter production at consuming plants.

The Raimund mine of the Republic Steel Corporation near Birmingham was closed during the year owing to exhaustion of its commercial-grade ore. Some 4 or 5 million tons of ore remain unmined, but they occur in thin beds of low-grade material.

Late in the year a settlement of portal-to-portal pay for iron miners in Alabama was taken to the United States Supreme Court. Three companies—the Tennessee Coal, Iron & Railroad Co., Sloss-Sheffield Steel & Iron Co., and Republic Steel Corporation were primarily affected. Late in the year operators of 13 Alabama iron-ore mines, including the three concerns named above, sought a declaratory judgment freeing them from the necessity of paying portal-to-portal wages to approximately 6,000 miners. The controversy concerned the phrase "work week"—whether or not it could be interpreted to mean all time spent underground. The United States Supreme Court handed down the decision on March 27, 1944, that, under the Wage-Hour law, payment is required for portal-to-portal travel time at underground iron-ore mines.

Iron ore, principally brown ore, was purchased from the smaller independent operators by the Republic Steel Corporation; the Tennessee Coal, Iron & Railroad Co., and the Woodward Iron Co. during the early part of the year. However, only Republic provided a market in the latter months. Total production of crude brown ore in Alabama in 1943 decreased 21 percent from 1942. All this ore was washed before shipment for consumption. The ratio of concentration was 5.22:1 in 1943, compared with 5.07:1 in 1942. The Russellville Nos. 5, 11, and 12 and La Grange mines of the Sloss Sheffield Steel & Iron Co., the Giles mine of the Central Iron Ore Co., and the Auxford and Docray mines of the Shook & Fletcher Supply Co. were the large brown-ore producers in the State.

Usable hematite produced in 1943 averaged 35.01 percent Fe, 0.16 percent Mn, 0.32 percent P, 14.95 percent SiO_2, and 15.57 percent CaO. Washed brown ore in 1943 contained 44.87 percent Fe, 0.76 percent Mn, 0.50 percent P, and 11.56 percent SiO_2.

Arizona.—Iron-ore production during 1943 came from two open-cut mines in Yuma County, both operated by E. E. Carlisle. A small quantity of hematite was shipped from these operations to Alhambra, Calif., where it was consumed in acid electric furnaces.

Arkansas.—A small quantity of magnetite from the Magnet Cove mine in Hot Spring County was shipped for consumption in Alabama blast furnaces in 1943.

California.—Iron-ore production in 1943 established a State record, as the output increased eightfold over that in 1942. This large increase in iron-ore output was due to the increased demand for ore by the California pig-iron industry, which experienced its first full year with a modern blast furnace. Most of the ore produced during the year came from the Vulcan mine near Kelso, San Bernardino County, which shipped hematite to the Fontana furnace for consumption. A total of 94,889 tons of magnetite was produced near Redding, Shasta County, which was used as ballast on shipping vessels. Magnetite sand from a deposit near Watsonville, Santa Cruz County, was produced for use as ballast and for roofing paper. This ore is usually graded according to specific gravity.

Property owned by the Southern Pacific Land Co. in northeastern Riverside County was purchased by the Kaiser Co. in 1943. It is situated on the Eagle Mountain ore deposit which Bureau of Mines engineers have estimated to contain 21,629,000 tons of positive ore, 15,000,000 tons of probable ore, and a potential reserve of 70,000,000 tons.[8]

Colorado.—A few tons of brown ore were mined near Salida, Chaffee County, during 1943, and shipped to Pueblo for blast-furnace use.

Georgia.—Most of the Georgia output was brown ore and came from 23 mines in Bartow, Floyd, Polk, and Walker Counties. The mines operated by the Mitchell & Hodge Co. at Taylorsville were the largest producers in the State in 1943. Other important brown-ore mines were operated by the Albea-Baker-York Mining Co., the Arrington Mining Co., the Clemmons Hill Mining Co., and the Lucas Mining Co. Hematite produced during the year came from the Walker's Ridge and Shaw mines in Walker County.

Independent producers in Georgia, like those in Alabama, are directly affected by the Birmingham iron and steel industry. Although iron and steel companies purchased Georgia merchant brown ore during the year, expanded output of the captive iron mines brought about a reduction of such purchases and enabled buyers to be more exacting in specifications.

Michigan and Minnesota.—See Review of Lake Superior District.

Missouri.—Iron-ore production in Missouri decreased very slightly from 1942. Chapman & Doane and the Missouri-Cliffs Mining Co. supplied the bulk of the State output from numerous small brown-ore mines in Wayne, Butler, and Perry Counties. Hematite was produced from small operations in Crawford, Franklin, Iron, Phelps, and St. Francois Counties by the Missouri Mining Co., the M. A. Hanna Co., the M. & B. Mining Co., Julian Pickles, and C. O. Peterson. Plans were underway in 1943 for large-scale operations at the Iron Mountain mine, St. Francois County. This mine has produced only a small quantity of hematite since 1930, when annual production totaled 97,012 tons. The mine will be operated by the Ozark Ore Co., a subsidiary of the M. A. Hanna Co.

Nevada.—Production of iron ore was resumed in Nevada in 1943 with six operators producing a total of 7,368 tons of hematite and magnetite. Mines near Battle Mountain, Lovelock, McKay, and Yerington supplied most of the output, which was shipped to California for metallurgical use and for ballast in shipping vessels.

New Jersey.—A total of 1,263,537 tons of crude magnetite was produced from underground mines in New Jersey in 1943, most of which was later concentrated magnetically. None of the concentrates produced in New Jersey are sintered at mine plants. The Scrub

---

[8] Bureau of Mines, War Minerals Report 97: February 1943, 44 pp.

Oaks mine, operated by the Alan Wood Steel Co., was again the largest individual producer in the State. Other producers were the Richard mine operated by the Richard Ore Co., the Mount Hope mine operated by the Warren Foundry & Pipe Corporation, and the Washington mine of the Alan Wood Steel Co. Most of the State output in 1943 came from Morris County, except for the relatively small tonnage produced at the Washington mine in Warren County.

The iron-mining industry in New Jersey was adversely affected by a manpower shortage in 1943, as were mines throughout the entire Northeastern district. The concentrator at the Mount Hope mine was damaged by fire in June, causing the annual output of concentrates to fall somewhat below the 1942 figure. A new vertical, four-compartment shaft at this mine was nearly completed at the end of the year. This shaft is the deepest of the New Jersey iron-ore producers and will have a daily capacity of 3,000 tons. The Ringwood mine in Passaic County was being reconditioned preparatory to operation by the Alan Wood Steel Co. on behalf of the Defense Plant Corporation.

New Mexico.—The St. Louis Smelting & Refining Co.'s El Paso iron claim at Hanover, Grant County, supplied most of the State output in 1943. Other producers included the Magnetite Mining Co. and the Lincoln Ore & Metal Co., operating in Lincoln County; the Ancho Mining Co., Bernalillo County; and mines operated near Ancho, Lincoln County, in Socorro County west of Carrizozo, and Roswell, Chaves County.

New York.—Crude magnetite was produced from six mines in the Adirondack district during the year. Except for lump ore, which is used as a charge and finishing ore in open-hearth furnaces, all of the ore was shipped as concentrate or sinter. The Old Bed-Harmony mine at Mineville and the Chateaugay mine at Lyon Mountain, both operated by the Republic Steel Corporation, were again the largest shippers in the State. The bulk of the ore shipped from these two properties was in the form of sinter, with lesser amounts of concentrates and Old Bed lump ore. The Clifton mine also produced lump ore, although most of the ore shipped was sinter. The Benson mine, which came into production during the latter part of the year, shipped a small quantity of concentrate. Construction of a sintering plant at this mine will be completed in 1944. The MacIntyre mine shipped magnetite and ilmenite concentrates during the year. A new crushing plant, magnetic cobbing plant, and Greenwalt-type sintering plant were under construction in 1943. When these are completed the daily production capacity will be 800 tons of ilmenite concentrates and 2,000 tons of magnetite sinter. The 30-mile railroad spur (a Defense Plants Corporation project) from the railhead at North Creek to the mine site was near completion in December; it will enable National Lead to dispense with the present haul by truck.

Republic's new concentrating and sintering plant, Mill No. 7, was completed during the year, as was development work at the Fisher Hill mine. Although a small quantity of crude ore was hoisted from this mine during the development period, the lack of manpower caused it to remain idle after it had been made ready for large-scale production. This labor shortage which was felt by all other mines in the district, kept New York State production considerably below mine capacity, and caused the development of the Croton mines at Brewster, West-chester County, to be deferred. District mining activities have been described in detail by the officials of the various operating companies in the Adirondack Iron Mining Issue of Mining and Metallurgy [9] and by Otte.[10]

Pennsylvania.—The Bureau of Mines cannot reveal iron-ore statistics for Pennsylvania, as virtually all of the production in the State comes from one operation—the Cornwall mine in Lebanon County. In 1943 this mine produced a large quantity of crude magnetite, which was shipped to the concentrator at Lebanon. Usable ore shipped from Lebanon for furnace consumption included both concentrate and sinter. The only other iron-ore output in the State was a small quantity of siderite from the Hazard and Little Gap mine near Palmerton, Carbon County, which was shipped for use by the paint industry.

During the year preparations were started to recondition the old Scotia mine near State College, Center County. The Scotia Mining Co. engaged Butler Bros., iron-mine operators of Minnesota, to operate the property. This open-pit mine is scheduled to produce 400,000 gross tons of brown ore annually using a truck haulage system. A washing and high-density plant was being built to concentrate the ore. Measured ore reserves are adequate for several years of operation at the scheduled rate of production. A property at Boyertown, approved by the War Production Board, was drilled in 1943; however, further development of this project has been deferred because of the manpower shortage.

South Dakota.—A total of 1,678 tons of brown ore has been produced from the Iron Lode claim near Rochford, Pennington County, during the last 2 years. Of this total, 1,098 tons were produced in 1942. This information was received too late to be included with 1942 statistics and is combined with 1943. All of this ore was shipped for making paint.

Tennessee.—Again in 1943 the only output of iron ore in Tennessee was byproduct pyrite sinter produced by the Tennessee Copper Co. at Ducktown. Shipments of sinter in 1943 contained 67.3 percent iron, 0.09 percent manganese, 0.006 percent phosphorus, and 2.0 percent silica.

Texas.—Iron ore was shipped from two mines in Texas during the year—the Linden mine in Cass County and the Moss mine in Llano County—but only the latter was productive in 1943. Both the Sheffield Steel Corporation and the Lone Star Steel Co. were engaged during the year in preparatory work for mining and beneficiating Texas brown ore, with operations scheduled to begin in 1944.

Utah.—A total of 922,959 tons of iron ore was produced in Utah in 1943 to establish a new record. This surpassed the 321,034 tons produced in 1942 by 187 percent. Large-scale mining at the Duncan mine, operated by the Colorado Fuel & Iron Co., and increased output at the Iron Mountain mine, operated by the Columbia Iron Mining Co., accounted for the increase. The only other operation in Utah was the Great Western mine, which produced a relatively small quantity of ore. All of these open-pit mines produced semialtered magnetite from deposits near Cedar City, Iron County. Ore shipped averaged 53.69 percent iron, 1.23 percent manganese, 0.106 percent phosphorus, 7.89 percent silica, and 2.03 percent lime.

[10] Otte, Herman F., Expanding Mineral Industry of the Adirondacks: New York State Div. of Commerce, Publication 10, February 1943, pp. 11-51.

Virginia.—Brown ore produced from the American Pigment Corporation mine at Hiwassee, Pulaski County, constituted the only output from Virginia in 1943. All but a few tons of this ore was washed before consumption by the paint industry.

Washington.—A total of 13,446 tons of ore was produced from three mines in Washington during 1943. The Neutral mine, operated by the Magnetic Mining Co., was the largest producer. Other active mines were the Napoleon, and the Fuller Iron claim, operated by the Spokane Portland Cement Co. and Pateros Iron Co., respectively. All of the ore was shipped either for ballast on shipping vessels or for cement.

Wisconsin.—See Review of Lake Superior District.

Wyoming.—The only iron ore produced in Wyoming in 1943 was hematite from the underground Sunrise mine, which is operated by the Colorado Fuel & Iron Corporation. Production in 1943 was 15 percent less than in 1942 because construction of the new shaft interfered with hoisting operations.

Iron ore mined in the United States in 1943, by States and counties

[Exclusive of ore containing 5 percent or more manganese]

[1] In addition there is an undetermined number of small pits. The output of these pits is included in the tonnage given.
[2] Includes output from 2 plants reprocessing tailings.

EMPLOYMENT AT IRON MINES

Data on employment at iron mines in 1943 are not yet available. However, a slight decrease in employment and man-hours worked is indicated. The average number employed is estimated at 32,500 men, working a total of 75,000,000 man-hours to produce 100,595,322 tons of ore—an average of about 1.3 tons per man-hour and a slight decrease from 1942. It is interesting to note that the output of usable iron ore per man-hour dropped from 0.524 ton in 1916 to 0.490 ton in 1917 (a decrease of 7 percent), whereas output per man-hour dropped from 1.531 tons in 1941 to 1.394 tons in 1942 (a decrease of 9 percent).

The decrease in efficiency since 1941 is due primarily to the large turn-over in employment and the resulting shortage of experienced miners. Other factors that contributed to this lowered efficiency include depreciation of machinery and equipment and the mining of lower-grade crude ore.

Relations between industry and labor at iron mines were comparatively good. Only a few man-hours were lost during the strikes at Michigan iron mines, and the dispute between labor and management over portal-to-portal pay at Alabama mines was settled in orderly fashion.

Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1941 by districts and States

WORLD PRODUCTION

Because of space limitations and a desire to emphasize countries that are potential sources of iron ore for United States consumption, the following discussions for 1943 are limited to nations of the Western Hemisphere.

World production of iron ore, 1938–43, by countries, in metric tons [1]

---

[1] In addition to the countries listed China, Egypt, Eritrea, Finland, French West Africa, Madagascar, nd New South Wales report production of iron ore, but complete data are not available.
[2] Production of Tofo mines. [3] Data not available. [4] Slovakia only. [5] Estimate included in total.
[6] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese. [7] Estimate. [8] Exports.
[9] U. S. S. R. in Asia included with U. S. S. R. in Europe.
[10] Exclusive of bog ore, which is used mainly for purification of gas. [11] Croatia only.
[12] January to July, inclusive. [13] January to June, inclusive. [14] January to September, inclusive.

Brazil.—The most important iron-ore deposit in Brazil—and one of the largest in the world—is at Itabira, 350 miles by rail from the port of Victoria, in the State of Minas Gerais. The ore is a high-grade hematite, with measured reserves of 173,000,000 metric tons and inferred ore of 1,000,000,000 tons.[11]

During 1943 considerable work was done on a benching operation at Caue Peak, which supplied a small output in 1942 and 1943. Ore-moving equipment consists of two 4-yard electric power shovels, one 1¼-yard Diesel shovel, and twelve 35-ton Diesel trailer trucks. The ore passes through primary (48-inch) and secondary (20-inch) gyratory crushers and is delivered to rail loading bins by means of a 36-inch rubber conveyor belt. Construction of ore-loading facilities at Victoria begun in 1938 by German engineers and contractors was continued in 1943 by Brazilian and American engineers. The tracks and switching yard are completed, and conveyor equipment is now being installed. Before these facilities were completed the ore reaching Victoria was unloaded by hand and loaded on ships with cranes. All of the iron ore shipped from Victoria in 1943 went to the United Kingdom.

Canada.—The Helen mine shipped 450,973 tons of ore from the Michipicoten range in Ontario, Canada, a decrease of 7 percent from 1942. The water-diversion program at the Steep Rock iron mines was in progress during the year; however, production is not expected to begin until late in 1944. Arrangements were completed during the year for the construction of a high-level pocket-type ore-loading dock at Port Arthur, Ontario, for use in connection with shipments of ore from Steep Rock. During the year prospecting was conducted in the Gunflint district and at the Josephine, Ruth, and Lucy mines.

Chile.—The important iron-ore operation in Chile is the Tofo mine near La Serena, Province of Coquimbo. Production from this mine in 1943 totaled 294,684 gross tons. Of this, 34,968 tons were shipped to blast furnaces at Corral near Valdivia, and the remainder was stockpiled. Stocks at the mine amounted to 290,940 tons at the end of the year. The ore deposit at Tofo is a capping of magnetite, largely altered to hematite and martite, which forms an irregular blanket on top of two small hills made up of diorite. The original north and south hills have now been leveled, and the present workings consist of a series of long benches forming an amphitheater opening to the east along the major axis of the ore body. The lowest level near the bottom of the deposit is 1,930 feet above sea level.

Cuba.—In 1943, 46,369 gross tons of iron ore were produced from the Daiquiri open-cut mine in Oriente Province; all was stock piled. For the 10-year period ended in 1941 annual shipments of iron ore from Cuba averaged 243,086 tons. This was reduced to 18,043 tons in 1942, when war shipping limitations prevented further movement of iron ore from Cuban ports. Stocks totaled 263,345 tons at the end of 1943 compared with 216,976 tons in 1942.

---

Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1943, in gross tons

Year	Juragua, Daiquirí, and Estancia (hematite and magnetite)	Sigua (hematite)	Mayarí (brown ore)	Guama (hematite)	El Cuero (hematite)	Total
1884–1941	22,496,872	20,438	3,976,853	41,241	903,103	27,438,507
1942	6,202	----------	11,841	----------	----------	18,043
1943	----------	----------	----------	----------	----------	----------
	22,503,074	20,438	3,988,694	41,241	903,103	27,456,550

Labrador.—Six iron-ore deposits in Labrador were discovered during the period 1936–39 by the Labrador Mining & Exploration Co. of Montreal. The principal deposits are at Sawyer Lake, about 280 miles north of Seven Islands in the Gulf of the St. Lawrence. The company estimated that the deposits contained 2,200,000 tons of hematite ore (averaging 65 percent iron) per 100 feet of depth. The phosphorus content is under 0.04 percent. Four deposits of good-grade ore are estimated to contain 70,000,000 tons to a depth of 1,000 feet. Of the two remaining deposits, one is high in manganese and the other high in silica. Field work by the Hollinger Consolidated Gold Mines, Ltd., in 1942 has confirmed these earlier estimates. Exploitation of the deposits would require the construction of a railroad from the site of the deposits to the St. Lawrence River at Seven Islands, a port open to navigation throughout the year. Additional deposits have been discovered since 1939, but estimates of reserves for these deposits are not yet available.

Mexico.—Mexico has important deposits of iron ore in the States of Lower California, Coahuila, Durango, Guerrero, Michoacán, and Oaxaca. The largest deposits in Mexico are those of Cerro del Mercado, Las Truchas, and El Mamey, situated near the West coast, which have been estimated to contain 300,000,000 tons of high-grade hematite, amenable to open-pit mining.

Newfoundland.—The Dominion Steel & Coal, Ltd., Sydney, N. S., announced the temporary closing of its Wabana iron-ore mines on February 25, 1943, owing to shipping shortages that made continued operation impractical. At the start of 1943, operations were cut to 3 days per week, dropping production from 5,700 tons per week to 2,400. Operations were resumed on a 4-day-a-week basis in the middle of May, in spite of an acute manpower shortage. The stock pile of 570,000 tons on hand at closing was reduced to 300,000 in December by continued shipments to blast furnaces at Sydney.

Venezuela.—The Iron Mines Co. of Venezuela, a subsidiary of the Bethlehem Steel Co., is developing a high-grade hematite deposit at El Pao near Upata in the State of Bolívar and continued its preparatory program in 1943, including the completion of roads, ore-loading plant, and the railway to the port of Palua on the Orinoco River, 1½ miles from the town of San Felix. Although difficulties have been encountered in obtaining supplies and equipment during the war, work is continuing, with a view toward commencing operations in 1945.

PIG IRON, FERRO-ALLOYS, AND STEEL

GENERAL FEATURES IN 1943

The steel industry, in supplying record demands for armament, experienced the most productive year in its history. Output of steel ingots and castings during 1943 totaled 88,836,512 net tons compared with 86,031,931 in 1942. New records were also established in the pig-iron and ferro-alloys industries as 60,765,195 and 2,032,979 tons, respectively, were produced. Steel capacity at the end of the year was 90,636,000 tons, to be increased to 95,948,000 on completion of the expansion program. Blast-furnace capacity was 64,305,000 tons at the end of December, and additional plants will raise this total to 70,441,000 when expansion is completed.

Shipbuilding continued to require more finished steel than any other single consuming industry and used 22,000,000 tons (one-third of production). Miscellaneous industries and exports, largely arms production and Lend-Lease shipments, together received the largest share of the year's steel output, as in 1942. A substantial decrease in the consumption of finished steel was apparent in the construction industry in 1943 as war-plant expansion was nearly completed. Steel for use in civilian products was curtailed as a result of diversion from railroad, agricultural, and household equipment. Pressure for an increased quantity of steel for civilian use caused a study of civilian steel requirements to be started late in the year by Government and industry, but it did not seem likely that there would be any large-scale diversion of steel into this channel for some time, since plants equipped to manufacture most civilian goods were engaged in war production.

---

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

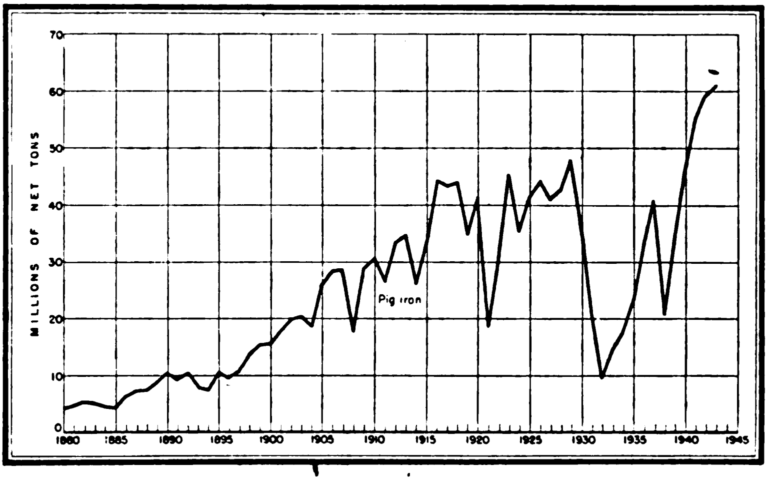

FIGURE 1.—Trend in production of pig iron in the United States, 1880–1943.

In 1943 the steel industry operated under the flexible Controlled Materials Plan, which was started during the first quarter. Under this plan it was able to improvise and to meet changing requirements with an efficiency that could not have been achieved under the old system of rigid priority controls.

[1] Data not available.

[2] Revised.

The problem of achieving the highest possible utilization of the Nation's manpower in war and essential civilian production was the most difficult one facing industry in 1943. Its critical nature was emphasized by the President in his message to Congress recommending a national service law. The redistribution of the Nation's manpower by means of shifts from civilian to war industries that characterized 1942 continued through 1943. These shifts are reflected in rates of employment turn-over. The average annual separation rate in manufacturing industries in the 5 years before Pearl Harbor ranged from 3.1 to 4.4 per 100 employees per month. This rate had increased in 1942 to 6.47 and is estimated at 7.22 for 1943. The character of the separations has also changed under the influence of wartime conditions. Voluntary quits, which averaged 1.97 per month per 100 employees in 1941, rose to 3.76 in 1942 and to 5.17 in 1943. Lay-offs per month per 100 employees averaged 2.82 during the 1930's and declined to 0.59 in 1943. The Bureau of Labor Statistics estimates that the time lost in 1943 by reason of strikes was 0.14 percent of the total man-hours in manufacturing industries. This compares with 0.05 percent in 1942 and 0.32 percent in 1941. The greatest loss to the 1943 production effort followed the year's three major strikes in the coal-mining industry, which accounted for one-third of the man-days of idleness during the year. If coal strikes are excluded, however, the man-days lost as a result of strikes still doubled the 1942 record. Concerning the effect of coal strikes on the iron and steel industry, the American Iron and Steel Institute reported a drop in pig-iron production from 5,123,703 tons in May to 4,786,944 in June, and steel production decreased from 7,543,127 tons to 7,010,334. Production of steel in the Pittsburgh-Youngstown district decreased from 99.0 percent of rated capacity in May to 91.0 percent in June, that in the Cleveland-Detroit district decreased from 104.5 percent to 99.5, and that in the Birmingham district from 95.5 percent to 88.0. A walk-out of 170,000 steel workers, chiefly in the Cleveland, Pittsburgh, and Youngstown districts, for 4 days beginning on Christmas caused an estimated loss of 125,000 tons of steel ingots.

The total wage earners in the iron and steel industry decreased from 522,000 in January to 508,000 in November. In complying with the 48-hour workweek recommended by the War Manpower Commission the average number of hours worked per week rose steadily from 41.9 in January to 45.6 in November. The average weekly earnings increased during this period from $46.16 to $51.74.

Late in the year the C. I. O.–United Steel Workers of America presented wage proposals including, among a list of 22 demands, a 17-cent hourly increase over the basic steel wage of 78 cents. Spokesmen for the steel companies maintained that the union's pay proposals would adversely affect the stabilization program and that any approved retroactive pay increases would necessitate substantial increases in the ceilings of steel prices.

POST-WAR OUTLOOK

Because of the accumulated unsatisfied demand for civilian consumer goods created during the war and an inevitable post-war reconstruction program, steel production is not likely to revert quickly to pre-war levels. However, unless retooling and reconversion for civilian production are permitted to get under way before hostilities close, a temporary drop in steel output may be expected during the reconversion period.

Production of steel for the 5-year period following World War I (1919–23) averaged 39,588,147 tons annually, an 11-percent increase over the 5-year (1912–16) period preceding the war, when annual production averaged 36,061,743 tons. If steel production in the post-war period continues at the wartime rate, this percentage increase will be far surpassed. However, if the industry were to operate at 62 percent of capacity, as it did following the last war (1919–23), annual steel production will average 60,000,000 tons, and pig-iron requirements (for both iron and steel furnaces) will total 40,000,000 tons yearly.

The demand for civilian products, which has accumulated in every steel market, will be met as soon as the task of reconversion is completed. The automotive industry, largest peacetime market for steel, will resume its former position. Automotive planners have estimated that a full year of production will be required to bring the Nation's car and truck total up to the 1941 level of 34,000,000 vehicles, and subsequent production will average 6,500,000 cars a year. The railroads, after carrying record-breaking volumes of freight and passenger traffic, will require large quantities of finished steel to replace worn-out rolling stock and rails, despite allocation of 4,260,000 tons to them in 1943.

When peace returns the construction industry will turn from war-plant expansion and shipbuilding to consumers' industries and public works projects. Preliminary surveys indicate a demand for about 1,000,000 tons of steel for highway bridges, in addition to steel required for grade crossings, docks and piers, schools, hospitals, and prefabricated parts for houses.

American producers are anticipating large exports of steel to meet rehabilitation requirements in war-devastated countries. Germany, formerly an important exporter, will find difficulty in competing in the world market, as virtually all of its steel capacity will be needed for reconstruction at home and probably will be called upon to restore devastated areas in other countries. Russia will need a considerable amount of American steel, at least for a few years, as will China. Australia, Brazil, Canada, Chile, India, Mexico, and South Africa have added to their own production facilities and are expected to import less steel.

Annual consumption of steel by the petroleum industry (largely as drill pipe, line pipe, and casing) has been estimated at 2,400,000 tons in the post-war period. Normal and replacement demand for steel by gas, water, and other utilities will consume additional tonnages.

Household appliances will provide a larger market after the war. Production of refrigerators, washing machines, ranges, irons, mixers, cooking utensils, and other household equipment have been curtailed perhaps more than any other commodities. The accumulated demand is far above the normal requirement, and when such goods are again made available steel consumption in these industries will be high.

It is expected that advancements in production technique will create a market in industrial machinery, as antiquated machines and equipment will be replaced by newer, more efficient types. Replacement of farm machinery and a general increase in agricultural mechanization will require additional quantities of steel.

The aircraft industry is expected to provide a post-war market for special alloy steels; however, the total quantity consumed will not affect steel output to a great extent, despite increased airplane production.

The container industry is expected to continue its position as a principal consumer; substitutes used in the war emergency, principally glass, paper, and various fibers, will largely give way to tin plate.

Shipbuilding, now the leading consumer of steel, will revert to its former position as a minor consumer after the war.

The pattern that ferro-alloys will follow after the war is uncertain. The future of this highly specialized industry will depend largely on technical developments. The increased use of alloying metals in the form of ores may reduce ferro-alloy requirements.

PIG IRON

PRODUCTION AND SHIPMENTS

Domestic production of pig iron, exclusive of ferro-alloys, increased 3 percent over 1942 in 1943 and established a new record. The output in 1943 comprised 60,692,620 net tons using coke and 72,575 using charcoal as fuel. Pennsylvania was the largest producer of pig iron in 1943, with 31 percent of the total; Ohio ranked second, with 23 percent.

Pig iron produced and shipped in the United States, 1942–43, by States

State	Produced		Shipped from furnaces

[2] Revised figure.

CONSUMPTION OF METALLIFEROUS RAW MATERIALS

The production of pig iron in 1943 required 109,801,584 tons of iron ore, sinter, and manganiferous iron ore, 3,337,369 tons of mill cinder and roll scale, 3,392,178 tons of open-hearth and Bessemer slag, 2,150,170 tons of purchased scrap, 297,128 tons of pyrite cinder, and 190,086 tons of miscellaneous material, an average of 1.961 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of pig iron made.

Of the pig iron manufactured in 1943, it is calculated that 89,334 tons valued at $1,023,928 were made from 161,402 tons of foreign ores, including ore from Africa, Canada, Cuba, Mexico, Newfoundland, Spain, and Sweden, indicating an average yield of 55.35 percent from imported ore. Domestic ore and sinter (109,640,182 tons) and other materials (9,366,931 tons) totaling 119,007,113 tons were reported as used in the manufacture of 60,675,861 tons of pig iron, indicating an average pig-iron yield of 50.99 percent from domestic materials. In addition, 1,417,778 tons of home scrap and 148,944 tons of flue dust were consumed in making pig iron in 1943.

Iron ore and other metallic materials consumed and pig iron produced in 1943 by States, in net tons

[1] Excludes recycled materials.

The iron ore used in Alabama (all domestic) in 1943 was mainly hematite from mines in Jefferson County. However, brown ore and small quantities of hematite from other districts in Alabama and Georgia were also used. In addition, ferruginous manganese ore of both domestic and Cuban origin amounting to 9,454 and 9,509 tons, respectively, were used. Because the average grade of ores used in Alabama is low, furnaces in this State use more ore per ton of pig iron than any other district in the United States.

The iron ore used in the Fontana (Calif.) furnace was hematite supplied by the Vulcan mine in San Bernardino County, Calif. Manganese-bearing ore of both domestic and Mexican origin was also used.

Maryland furnaces consumed chiefly domestic ore in 1943, but some iron ore from Africa and pyrite cinder of both domestic and foreign origin were used. These furnaces had a low consumption of ore per ton of pig; however, they used proportionately more miscellaneous materials than any other State.

Blast furnaces in Illinois, Indiana, Kentucky, Michigan, Minnesota, and West Virginia used Lake Superior iron ore and manganiferous iron ore almost exclusively.

In New York the furances in the Buffalo district used ore from the Lake Superior district and Canada, magnetite from New York, and some manganese ore from Cuba, and the furnace at Troy consumed magnetite sinter from the Chateaugay mine at Lyon Mountain, N. Y.

Foreign iron and manganiferous iron ore consumed in the manufacture of pig iron in the United States, 1942–43, by sources of ore, in net tons

Source	1942	1943	Source	1942	1943
Africa	4,871	36,034	Mexico		11,512
Australia	790		Newfoundland	24,180	23,035
Brazil	9,173		Spain	2,721	336
Canada	114,906	78,745	Sweden	990	702
Chile	662,420		Source not stated	1,932	
Cuba	77,368	11,038			
India	1,573			900,924	161,402

Ohio blast furnaces consumed magnetite sinter from New York in addition to hematite from the Lake Superior district.

Virtually all the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Those in the eastern part of the State used some Lake ore; magnetite ores from Pennsylvania, New Jersey, and New York; and some ore from Africa, Newfoundland, Spain, and Sweden.

The Colorado furnaces used hematite from the Sunrise mine in Wyoming, semialtered magnetite from the Duncan mine (Utah), and magnetite and manganese-bearing ores from New Mexico.

The Provo (Utah) furnace used semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, and manganese-bearing ores, chiefly from Nevada. The sinter used was produced at Provo.

VALUE AT BLAST FURNACES

The average value of all grades of pig iron given in the following table is based upon reports of producers to the Bureau of Mines. The figures represent the approximate values f. o. b. blast furnaces and do not include the values of ferro-alloys. The general average value for all grades of pig iron at the furnaces was $20.95 a net ton in 1943, $0.18 more than in 1942.

Average value per net ton of pig iron at blast furnaces in the United States, 1939–43, by States

State	1939	1940	1941	1942	1943
Alabama	$14.42	$14.30	$17.25	$17.30	$17.35

CONSUMPTION

Consumption of pig iron rose 2 percent in 1943 over 1942. Pig iron, a product of the blast furnace, is a semi-raw material and, except for the small quantity used in direct castings, moves to steel- or iron-melting furnaces for further refining or mixture with other required ingredients. In 1943, 89 percent of the pig iron went to steel-making furnaces (open-hearth, bessemer, and electric) to be processed into steel. Direct castings took 4 percent of the 1943 total, and the remaining 7 percent was consumed in iron-making furnaces, of which the cupola is the most important. The consumption of pig iron, by types of furnace, for 1940 to 1943 is shown in the following table. The quantities of pig iron used in these furnaces are supplemented by the addition of ferrous scrap. The proportion of pig iron to scrap used in steel furnaces increased in 1943 over 1942.

Consumption of pig iron in the United States, 1940–43, by type of furnace

Type of furnace or equipment	1940		1941		1942		1943	
	Net tons	Percent of total	Net tons	Percent of total	Net tons	Percent of total	Net tons	Percent of total

	46,185,828	100.0	56,185,472	100.0	59,042,883	100.0	60,315,159	100.0

[1] Some pig iron used in making direct castings included in cupola.
[2] Less than 0.05 percent.

Plants using pig iron are situated in all 48 States, the District of Columbia, and Alaska. As expected from the uses of pig iron, consumption is concentrated largely in the iron- and steel- making centers of the North Central, Middle Atlantic, and Southeastern States. These areas in 1943 used about 97 percent of the pig iron, Pennsylvania (the leading consumer) taking about 32 percent of the total and Ohio (the second-largest consumer) 21 percent.

[1] Pig iron is produced in Chile, New Zealand, and the Philippine Islands in addition to countries listed, but production figures are not available.
[2] Year ended June 30.
[3] Estimate included in total.
[4] Data not available.
[5] Estimated production.
[6] Approximate production as published by The Iron Age, vol. 147, No. 1, January 2, 1941, p. 61.
[7] Approximate production as published by Steel, vol. 106, No. 1, January 1940, p. 269.
[8] Included in the German figure in 1940.
[9] Beginning with March 1935, production of the Saar is included with that of Germany.
[10] Croatia only.

Reliable production data have not been available since 1939. An estimate of the 1943 world production, based upon the rate of increase for the years from 1934 to 1940, indicates a figure of 120,000,000 metric tons. Two counteracting forces undoubtedly have operated to throw production off the expected value. The effect of accelerated demand (evident in all commodities) has operated to raise the production of pig iron, while the effect of military attack (largely air) upon industrial centers has operated to offset this increase.

On the whole, the 1943 world production of pig iron may be expected to have reached 120 to 130 million net tons.

FERRO-ALLOYS

PRODUCTION AND SHIPMENTS

The production of ferro-alloys in 1943 totaled 2,032,979 net tons compared with 1,898,260 (revised figure) tons in 1942—an increase of 7 percent. In 1943 ferro-alloys were made at 18 blast-furnace plants, 25 electric-furnace plants, and 3 aluminothermic plants. In addition 2 plants made ferrophosphorus and 2 plants made ferrosilicon as a byproduct. Of the 1943 total, 1,118,066 tons were made in blast furnaces, 883,618 tons in electric furnaces, and 30,013 tons by the aluminothermic process; 1,282 ton of alloys were produced as byproducts. Shipments of all classes of ferro-alloys in 1943 increased 7 percent in quantity and 5 percent in value over 1942.

Ferro-alloys produced and shipped from furnaces in the United States, 1942–43

[3] Silicomanganese, manganese briquets, ferrochromium, chrome-manganese, ferrocolumbium, zirconium-ferrosilicon, and alsifer, and ferroboron in 1943.
[4] Revised.

Ferromanganese.—The output of ferromanganese in 1943 came from 11 blast-furnace plants and 2 electric-furnace plants compared with 11 blast-furnace plants and 3 electric plants in 1942. Of the manganese ore used in 1943, 85.6 percent was foreign ore. The ferromanganese produced in 1943 averaged 78.98 percent manganese. During 1943 steel producers used 13.0 pounds of metallic manganese as ferro-alloys, per ton of steel produced. Of this quantity 11.7 pounds were in the form of ferromanganese. A total of 736,288 tons of ferromanganese was consumed in 1943—virtually all by the iron and steel industry.

Spiegeleisen.—The spiegeleisen produced in 1943 came from seven blast-furnace plants, averaged 19 percent manganese, and had an average value of $32.16 per net ton at furnaces. All spiegeleisen in 1943 was manufactured from domestic materials and was made by the Carnegie-Illinois Steel Corporation, Pittsburgh, Pa.; the New Jersey Zinc Co., New York, N. Y.; the Sloss-Sheffield Steel & Iron Corporation, Birmingham, Ala.; E. J. Lavino & Co., Philadelphia, Pa.; and the Inland Steel Co., Chicago, Ill.

Ferrosilicon.—Of the total of 818,351 net tons of ferrosilicon produced in 1943, 309,068 tons were produced in blast furnaces, 508,260 tons in electric furnaces, and 1,023 tons as a byproduct in the manufacture of artificial abrasives in electric furnaces. The silicon content of the production in 1943 ranged from 9 to 95 percent and averaged 31 percent. Blast-furnace production averaged about 10 percent silicon.

Ferrophosphorus.—Most of the ferrophosphorus was made in electric furnaces in 1943. However, some was produced as a byproduct in the manufacture of phosphates. The ferrophosphorus produced in 1943 averaged 24 percent phosphorus, and shipments were valued at $63.78 per net ton f. o. b. furnaces. All was made from domestic materials.

Ferrotungsten.—Shipments of ferrotungsten gained 4 percent in quantity and 3 percent in value over 1942. The 1943 shipments contained 78.56 percent (11,632,568 pounds) of tungsten and were valued at $1.899 per pound of contained tungsten. Production totaled 7,561 net tons containing 78.54 percent (11,876,016 pounds) of tungsten. The ferrotungsten in 1943 was made in electric furnaces from both foreign and domestic ores.

Ferrochromium.—The industrial consumers of ferrochromium reported using 183,019 tons of ferrochromium during 1943.

Ferromolybdenum.—The bulk of the ferromolybdenum produced in 1943 was made by the aluminothermic process. All was produced from domestic ores and averaged 63 percent Mo.

Molybdic oxide, calcium molybdate, and molybdenum compounds.—As these products are used as alloying agents in the production of iron and steel, they are included with ferro-alloys. These compounds averaged 53 percent Mo in 1943. These materials are considerably less expensive than ferromolybdenum and consequently are used to a greater extent.

Ferrovanadium.—The ferrovanadium in 1943 was produced by electric and aluminothermic processes, using both foreign and domestic ores.

Silicomanganese.—The silicomanganese produced in 1943 averaged 67 percent manganese and was produced in electric furnaces.

Manganese briquets.—During 1943, manganese briquets averaged 57 percent Mn. This product is used chiefly in the foundry industry.

Ferrotitanium.—The bulk of the ferrotitanium produced in 1943 was made in electric furnaces, but some was produced by the aluminothermic process. Both foreign and domestic ores were consumed in the manufacture of ferrotitanium in 1943. Ferrotitanium is used chiefly as a deoxidizer and scavenger in steel making and is also valuable as an alloying agent in certain steels to prevent intergranular corrosion.

Ferroboron.—The ferroboron produced in 1943 averaged 16 percent B. Boron finds its main use in special steels as a hardening agent.

Ferrocolumbium.—Columbium additions have a valuable use in preventing intergranular corrosion. The production in 1943 averaged 57 percent Cb.

Zirconium-ferrosilicon.—The zirconium-ferrosilicon produced in 1943 averaged 14 percent Zr. Zirconium is a powerful deoxidizer and scavenger and reduces age hardening, thereby improving deep drawing properties of sheet steel.

FOREIGN TRADE

Imports and exports of the rarer metals are not recorded separately but are grouped as shown in the following tables. Ferromanganese and spiegeleisen comprised most of the imports in both 1942 and 1943.

Ferro-alloys and ferro-alloy metals imported for consumption in the United States, 1942–43, by varieties

Variety of alloy	1942			1943		
	Gross weight (net tons)	Content (net tons)	Value	Gross weight (net tons)	Content (net tons)	Value
Ferromanganese:

Other ferro-alloys [1]	14, 637	6, 459, 196	33, 787	5, 513, 018

[1] Includes ferrosilicon, ferrotungsten, ferrovanadium, and other ferro-alloys.

STEEL

GENERAL FEATURES

Steel production continued at a high rate throughout 1943, furnaces operating at an average of 98 percent of capacity for the year. Capacity for producing steel increased 343,000 net tons to reach a new record total of 90,636,000 tons. Total production of steel in the United States in 1943 was 88,836,512 tons, a record output. Of the total, 88.5 percent was made in open-hearth furnaces. 6.3 percent in bessemer converters, 5.2 percent in electric furnaces, and only 146 tons in crucible furnaces. The data concerning steel production used by the Bureau of Mines are furnished by the American Iron and Steel Institute. The output from steel foundries that do not produce steel ingots is not included in the statistics.

Steel capacity, production, and percent of operations, 1939–1943, in net tons [1]

[Ingots and steel for castings [2]]

Year	Capacity	Production					Percent capacity
		Open hearth	Bessemer	Crucible	Electric and all other	Total	
1939	81,828,958	48,409,800	3,358,916	931	1,029,067	52,798,714	64.5
1940	81,619,496	61,573,083	3,708,573	1,024	1,700,006	66,982,686	82.1
1941	[3] 85,158,150	74,389,619	5,578,071	2,313	2,869,256	82,839,259	97.3
1942	[4] 90,293,000	76,501,957	5,553,424	2,010	3,974,540	86,031,931	96.8
1943	[5] 90,636,000	78,621,804	5,625,492	146	4,589,070	88,836,512	98.0

[1] American Iron and Steel Institute.

[2] The figures include only that portion of the capacity and production of steel for castings used by foundries which were operated by companies producing steel ingots.

[3] Average annual capacity as of January 1 and July 1, 1941.

[4] Annual capacity as of January 1, 1943.

[5] Annual capacity as of December 31, 1943.

Monthly output ranged from a low of 6.8 million tons in February to a peak of 7.8 million tons in October, when operations were at 102 percent of capacity. During the first 3 months of the year the operating rate increased progressively from 98 percent to 100 percent of capacity. In the second quarter the operating rate decreased progressively to June, when strikes at coal mines caused a drop to 95 percent of capacity. The operating rate increased steadily from July until October, followed by decreases in November and December. The operating rate of 94 percent of capacity in December was the lowest of the year, because new additional capacity could not be fully utilized owing to the manpower shortage and a strike of steel workers.

In 1943, 92.5 percent of the domestic steel output was made in furnaces in the Northeastern district, 4.3 percent was produced in the Southern district, and 3.2 percent was made in the Western district compared with 92.9 percent, 4.3 percent, and 2.8 percent, respectively, in 1942.

Open-hearth steel ingots and castings manufactured in the United States, 1939–43, by States, in net tons

Steel electrically manufactured in the United States, 1939–43, in net tons

[Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots]

Year	Ingots	Castings	Total	Year	Ingots	Castings	Total
1939	951,522	77,545	1,029,067	1942	3,843,757	130,783	3,974,540
1940	1,608,032	91,974	1,700,006	1943	4,473,377	115,693	4,589,070
1941	2,758,611	110,645	2,869,256				

The steel output for 1943 includes 13,149,818 net tons of alloy-steel ingots and castings, which represents 15 percent of the total. This figure includes steels in which the minimum of the range specified in one or more of the elements named exceeds the following percentages: Copper, 0.60 percent; manganese, 1.65 percent; silicon, 0.60 percent; aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, and zirconium, any percentage. The output of alloy steels in 1943 increased 14 percent and that of total steel 3 percent over 1942. Of the total alloy-steel output in 1943, 65 percent came from basic open hearths, 5 percent from acid open hearths, 30 percent from electric furnaces, 136 tons from crucible furnaces, and none from bessemer converters.

From the accompanying tables it will be seen that most of the steel made in electric furnaces (86 percent in 1943) is alloy steel. Typically, steels with higher alloy content are made in electric furnaces and steel with lower alloy content by the open-hearth process.

Alloy-steel ingots and castings manufactured in the United States, 1939–43, by processes, in net tons

[Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots]

CONSUMPTION OF METALLIFEROUS MATERIALS

During 1943 steel furnaces used a total of 6,145,626 net tons of ores (excluding mill scale) and sinter. Of this quantity 74,924 tons were foreign, originating in Africa, Brazil, Mexico, and Sweden.

Both charge ore and feed ore are used in the basic open-hearth process. Charge ore is added for the purpose of furnishing oxygen to the charge before it is melted. This ore should be low in both combined and uncombined moisture, silica content, and fines. Ore containing high quantities of silica requires large additions of limestone and consequently large volumes of slag, which are expensive and reduce furnace efficiency.

Feed ore, which is added to the heat during the working period, should be hard, dense, coarse, and low in moisture. Although rather high silica ore can be used as feed ore it is undesirable, as in charge ore, because of the high volume of slag necessitated. Lump ore, which is preferred as feed ore, commands a high price because it is usually mined by underground methods, and the supply is limited.

Sintered pyrite ash and sintered iron ore frequently are used as charge and feed ores. However, these materials are less dense than lump ore and lower in oxygen content. Consequently, more sinter is required to accomplish the same amount of oxidation.

The following table was compiled from Bureau of Mines surveys. There are no comparable data for previous years.

Metalliferous materials consumed in steel furnaces in he United States in 1943, by districts, in net tons

District	Iron ore		Sinter	Manganese ore		Ferro-alloys	Iron and steel scrap		Pig iron

GENERAL PERSPECTIVE

The domestic manganese industry in 1943 was signalized by the Nation's ability to maintain comfortable ore stocks by continuing imports at a virtual pre-war level. This was achieved in spite of enemy submarine activity, which sought to create a shortage of this strategic metal in the United States when it was urgently needed to support steel production. The success of the import program has been the leading cause for permitting domestic production to lag considerably behind schedules made in 1941 and 1942. Several projects designed to supply a large proportion of our requirements during the war were either seriously delayed or deferred. Among these was the proposal[2] to build 12 concentrating plants in 8 States to utilize our large, low-grade ore reserves. Only 2 of these projects were completed—one at Las Vegas, Nev., designed to ship 100,000 tons of nodules per year, and one in Butte, Mont., to yield 20,000 tons annually. At the close of 1943, however, neither of these operations had begun to ship high-grade products.

Domestic shipments of manganese ore containing (natural) 35 percent or more manganese amounted to 205,173 short tons in 1943—8 percent more than in 1942 but 40 percent less than in 1918; in addition, 471,593 tons of ore containing (natural) 10 to 35 percent manganese and 1,251,275 tons containing 5 to 10 percent manganese were shipped during 1943. Consumption of manganese ore in the United States reached the record total of 1,588,323 tons during the year, imports amounted to 1,429,599, and total United States stocks of ore at the end of the year were 1,732,713 tons.

[1] Includes small quantity of miscellaneous ore.
[2] Imports for consumption.
[3] Manganese content.
[4] Includes small quantity of other manganese alloys.

Metals Reserve Co.—In spite of the heavy drain on available manganese ore, Government stock piles declined only slightly during 1943. Contract purchases continued at a high rate during the year. Foreign ore in stock, mostly at Baltimore and Pittsburgh, totaled 738,686 tons on December 31, 1943. Domestic contract ore in stock at the close of the year amounted to 115,017 tons. These totals were 0.4 and 22 percent less, respectively, than a year ago. Stocks of small-lot purchases at the end of 1943 totaled 24,378 tons of metallurgical ore averaging (dry) 41.88 percent manganese and 640,469 tons of low-grade ore averaging (dry) 24.88 percent manganese. Most of the low-grade ore was held for concentration by the Manganese Ore Co. at Las Vegas, Nev., and the Domestic Manganese & Development Co. at Butte, Mont. Payments by the Metals Reserve Co. for the concentrating-grade ore totaled $4,807,264 at the end of 1943, or an average cost of $7.51 per short ton.

Price regulation.—The ceiling prices of manganese ore were virtually unchanged from 1942. Two additional minor amendments to Maximum Price Regulation 248 were issued in 1943. Amendment 2, effective February 15, 1943, exempted from price control any ore sold to a processor who uses it in the production of spiegeleisen or of ferromanganese containing less than 75 percent manganese, or who charges it directly in the production of steel or in foundry operations. Amendment 3 clarified the term "basing point" to mean that point which would result in the lowest cost for the buyer. Both amendments affected very small portions of the total manganese ore.

Revised Maximum Price Regulation 138, covering ferromanganese, manganese alloys, and metal, became effective July 1, 1943. This revision incorporated into the order all types of manganese alloying materials, whereas the original maximum price regulation covered only standard ferromanganese. The revised regulation (besides providing dollars-and-cents ceilings for standard ferromanganese, with specific differentials to cover crushing and grinding) established specific maximum prices for spiegeleisen, silicomanganese, manganese metal, and substandard ferromanganese, previously covered by the general maximum price regulation. The prices provided in the new revised regulation were essentially the same as those previously in effect. An exception was a small increase made to cover the expenses of freight and handling of the two smallest sizes of standard ferromanganese. Minor revisions to this regulation were published in Amendment 1 to Revised Maximum Price Regulation 138, effective August 7, 1943.

Earlier regulations issued by the Office of Price Administration are described in the Manganese and Manganiferous Ores chapter of Minerals Yearbook, 1942.

POST-WAR OUTLOOK

Both domestic production and imports of manganese ore after the war will depend on steel requirements and the action taken in maintaining manganese stock piles. However, it is likely that imports will continue at a fairly high rate in view of our relatively small domestic output.

If steel operations after the war should continue for some time at the wartime rate, manganese-ore requirements will continue at 1,500,000 tons per year. However, at, say, 60,000,000 short tons of steel and 13 pounds of contained manganese used per ton (13.3 pounds in 1943) of steel, 390,000 tons of contained manganese would be required for steel. Added to this requirement would be the foundry, battery, chemical, and miscellaneous industries, which would place the total annual requirements for manganese ore at around 1,000,000 tons. The average apparent consumption for the 5 pre-war years 1935–39 was 758,000 tons. Steel production for this same period averaged 46,574,000 tons.

Dry-cell battery manufacture will continue to use most of the nonmetallurgical ores. However, the use of manganese in agricultural fertilizers has developed into a substantial industry and may increase after the war. The use of manganese ore by the photographic industry for the manufacture of hydroquinone should continue to be a major use of chemical ore. Of our annual requirements for battery and chemical ores—35,000 and 15,000 tons, respectively—perhaps 25,000 tons of battery ore but virtually no chemical ore will be available from domestic sources.

Electrolytic manganese, which now constitutes less than 0.5 percent of total manganese supplies, is expected to increase gradually in usage through new metallurgical applications and its advantage as a steel furnace addition owing to the absence of carbon and its high manganese content. Relative to a domestic economy this metal is important because it can be produced from low-grade ores. Advancements in technology should lower the production costs of this material to make it more competitive with other manganese alloys.

DOMESTIC PRODUCTION

The following table shows the various types of manganiferous materials shipped by domestic producers from 1939 to 1943:

Manganiferous raw materials shipped by producers in the United States, 1939–43, in short tons

Year	Metallurgical ore				Battery ore	Miscellaneous
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		
1939	20,810	268,289	526,067	144,747	8,699	3,315
1940	30,416	358,406	914,526	172,990	10,383	4,137
1941	73,852	512,162	918,725	282,049	11,399	2,543
1942	177,966	265,663	1,500,613	292,051	15,410	473
1943	195,096	468,862	1,251,275	270,328	12,704	104

Shipments of various grades of manganese-bearing ores during the last 5 years are given, by States, in the following tables. In addition, battery-grade ores were produced in California, Georgia, and Montana; a small quantity of miscellaneous ore came from Tennessee; and manganiferous zinc residuum was produced from New Jersey zinc ores.

[1] Containing 35 percent or more manganese (natural).

[2] Value included in total.

[3] 4 producers in California shipped both battery and metallurgical ore.

[4] Containing 10 to 35 percent manganese (natural).

[5] Excludes concentrating-grade ore shipped to Government stock piles.

[6] Containing 5 to 10 percent manganese (natural).

MINING BY STATES

Arizona.—The large producing manganese mines of Arizona in 1943 were the American mine in Gila County, the Black Warrior mine in Mohave County (Artillery Peak district), and the Denison and Shafer operations in Coconino County. The ferruginous manganese ore for metallurgical use came also from Coconino, Gila, and Mohave Counties. Not included in the statistical data for Arizona were 8,450 tons of concentrating-grade ore containing 2,135 tons of manganese, reported shipped to Government stock piles during 1943.

Arkansas.—The Arkansas Manganese Co. and the Walter H. Denison Manganese & Contracting Co., both of Batesville, continued to ship most of the manganese ore from Arkansas during 1943; however, there was a total of 20 active shippers during the year. Most of the ore came from Independence County, but small shipments were made from Izard, Pike, and Polk Counties. Included in the ferruginous manganese ore shipped was a small shipment from the Lindsey Cave mine in Stone County.

California.—Shipments from 19 counties comprised the State total in 1943. The largest producing mine was the Buckeye in Stanislaus County, which shipped 5,013 tons of ore averaging (natural) 39 percent manganese. The Barker mine in Santa Clara County shipped 1,844 tons of metallurgical ore averaging 38.25 percent Mn and 1,726 tons of battery ore averaging 66.30 percent MnO_2. The Iron Dyke and Lakeview claims in Plumas County shipped 2,211 tons of ore averaging 45.91 percent manganese.

A map showing the location and relative importance of California manganese deposits has recently been published by the California Department of Natural Resources.[3]

Colorado.—The bulk of the manganese ore produced in Colorado in 1943 came from the Whippoorwill mine in Ouray County. Small shipments were made from the Last Chance and Blackbird claims in Grand County, the Jo Dandy and Lucky Star claims in San Juan County, the Inspiration No. 1 claim in Gunnison County, and the Pershing mine in Saguache County.

Georgia.—Virtually all the manganese ore from Georgia in 1943 was shipped by Neel & Neel from the Aubrey mine in the Cartersville district; in addition, a small quantity of battery ore was shipped from the Etowah property in Bartow County, and a small shipment of metallurgical ore was made from Whitfield County. The ferruginous manganese ore was supplied by the Appalachian Manganese Corporation; the Aubrey, Bearden, Blue Ridge, Dobbins, and New Riverside Ochre Co. mines in Bartow County; and a small shipment from Murray County.

Idaho.—The small quantity of ore from Idaho was shipped from Bannock County by Peterson & Loose.

Michigan.—The Bengal mine on the Menominee range furnished the State total (all ferruginous manganese ore) in 1943. The ore averaged (natural) 10.51 percent manganese and 39.07 percent iron and contained 7.07 percent moisture.

Minnesota.—Upon a basis of contained manganese, Minnesota was the largest producing State in 1943. However, the ore was low-grade, the highest-grade being shipped from the Louise and Merritt mines, where it averaged (natural) 15.61 percent manganese. Shipments from these two mines totaled 253,779 tons of ferruginous manganese ore and 104,526 tons of manganiferous iron ore. The remainder of the manganiferous ore from Minnesota came from the Mahnomen and Sagamore mines and the Hillcrest-Alstead-Arko group in Crow Wing County, the Bennett mine in Itasca County, and the Corsica mine in St. Louis County.

---

[3] State of California, Dept. of Natural Resources, Economic Mining Map of California No. 5—Manganese: 1943.

Missouri.—The output from Missouri in 1943 came from the Smokey Mountain mine in Shannon County.

Montana.—The major producer in Montana, and in the United States, was the Anaconda Copper Mining Co. at Butte, which produced and shipped 128,084 tons of sintered nodules, with a natural analysis as follows: Manganese 61.10 percent, iron 2.51 percent, silica 7.90 percent, phosphorus 0.069 percent, and moisture 0.018 percent. Most of the ore for this operation came from the Emma mine, but some from the Travona and Orphan Girl mines was used; these three mines are in the Butte district, Silver Bow County.

The battery ore was supplied by the Moorlight and Trout mines in the Philipsburg district, Granite County.

In addition to the shipments from Silver Bow and Granite Counties, small shipments of metallurgical ore were made from the Cook Prospect in Missoula County and the Manganese mine in Jefferson County.

The 400-ton custom mill of the Domestic Manganese & Development Co. at Butte was just getting into operation at the close of 1943. About 2,000 tons of high-grade nodules per month are expected to be attained from this plant in 1944.

Nevada.—The Golconda Mining Co., with operations at the Black Diablo mine, continued in 1943 to be Nevada's largest shipper. Shipments from the mine since 1929, when it is believed the first were made, are given as follows:

Manganese and ferruginous manganese ores shipped from the Black Diablo mine, 1929–43, in short tons [1]

Year	Short tons	Percent Mn (natural)	Year	Short tons	Percent Mn (natural)
1929	114	28.9	1942	5,896	35.3
1937	597	33.4		2,743	31.0
1940	235	35.8	1943	7,888	35.8
	5,167	27.9		5,066	27.3
1941	2,789	37.4			
	8,073	31.3			

[1] None reported 1930–36 and 1938–39.

Vietti & Caviglia shipped 1,352 tons of ore containing 38 to 40 percent manganese from the Manganese Mining Co. mine in White Pine County. Relatively small shipments were made also from Elko, Humboldt, Lander, and White Pine Counties.

The Manganese Ore Co., operating in Las Vegas Wash, Clark County, did not ship any concentrates in 1943. However, at the year end the task of saturating the large quantities of solutions with manganese was under way.

New Mexico.—The production of manganese ore in New Mexico in 1943 was small and came from Hidalgo, Luna, Sierra, and Socorro

Counties. All the ferruginous manganese ore shipped came from the Boston Hill mine in Grant County.

North Carolina.—The Clough Manganese mine in Alleghany County supplied the State total of manganese-bearing ore in 1943.

Oklahoma.—The Ouachita Manganese Co. shipped ore averaging (natural) 40 percent manganese from McCurtain County.

Oregon.—W. E. Warren shipped manganese ore from the McAdams property in Curry County in 1943.

South Carolina.—Abernathy & Kehaya shipped ore containing (natural) 37.7 percent manganese from McCormick County. Ferruginous manganese ore was shipped from Aiken and Greenwood Counties.

South Dakota.—The very small output of metallurgical-grade ore from South Dakota came from the Ballard and Fremont claims in Lawrence County.

Tennessee.—The Embree mine continued in 1943 to be the largest shipper in the State. Shipments from this mine amounted to 1,595 tons of metallurgical ore containing 548 tons of manganese and 652 tons of ferruginous ore containing 125 tons of manganese. The rest of the shipments from Tennessee came from Johnson, Monroe, and Unicoi Counties.

The manganiferous and ferruginous chert of Perry and Lewis Counties has recently been described by Burchard.[4]

Utah.—The small shipments from Utah were made from the Manganese King, San Raphael, and Wild Cat mines in Kane, Grand, and Utah Counties, respectively.

Virginia.—Seventeen shippers in Augusta, Bland, Craig, Rockingham, Smyth, and Wythe Counties supplied the State total in 1943. The larger operations during the year, in order of importance, were the Virginia Hardwood Lumber Co. mine in Bland County, the Glade Mountain mine in Smyth County, and the Old Dominion mine in Augusta County. The Old Dominion, which has not operated since 1918 when 672 short tons were shipped, came into production during the last quarter of 1943 and shipped 1,211 tons averaging 46.15 percent manganese. This mine is expected to ship 25,000 tons per year under full production.

Manganese deposits of the Elkton area are described by King [5] and those of the Lyndhurst-Vesuvius district by Knechtel.[6]

Washington.—The total production from Washington was hausmannite ore, averaging (natural) 50.05 percent manganese, from the Crescent mine in Clallam County.

IMPORTS OF MANGANESE ORE

In addition to the data given in the following table, general imports of ferruginous ore and residuum in 1943 amounted to 11,113 tons containing 3,223 tons of manganese; of this total, 2,206 tons came from the Arabian Peninsular States, 8,881 tons from Egypt, and 26 tons from Mexico. Imports for consumption of these materials, amounting to 11,148 tons containing 3,232 tons of manganese, were valued at $127,479.

[1] Comprises ore received in the United States during year; part went into consumption, and remainder entered bonded warehouses.

[2] Comprises receipts during year for consumption and ore withdrawn from bonded warehouses during year (irrespective of time of importation).

[3] Less than 1 ton.

CONSUMPTION AND STOCKS OF MANGANIFEROUS RAW MATERIALS

The consumption of manganese ore in 1943 increased 7 percent over the 1,481,672 tons consumed in 1942. Of the 1943 total, 86 percent was of foreign origin, a significant change from the ratio of foreign ore used in 1942, when 97 percent (1,435,388 tons) came from foreign sources. Industrial stocks of manganese ore on December 31, 1943, were 4 percent less than the 885,744 tons on hand at the end of 1942.

The following table shows actual tons of manganese ore (containing 35 percent or more manganese, natural) and alloys consumed during 1943 and in stock at the end of the year.

Consumption and stocks of manganese ore and manganese alloys in the United States in 1943, gross weight in short tons

Manganese briquets	4,962	1,875	355

[3] The greater part of the ore consumed was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.

The following table shows ores available for consumption in the United States in 1943 but does not consider consumer or Government stocks at the beginning and end of the year.

Indicated consumption of manganiferous raw materials in the United States in 1943

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Short tons	Mn content (percent)	Short tons	Mn content (percent)	Short tons	Mn content (percent)
Domestic shipments	205,173	53.3	741,921	14.2	1,251,275	7.6
Imports for consumption	1,511,630	48.2	11,148	29.0	(1)	(1)
Total available for consumption	1,716,803	48.9	753,069	14.5	1,251,275	7.6

[1] Estimated as none consumed.

METALLURGICAL INDUSTRY

The steel industry in 1943 used an average of 13.3 pounds of manganese per short ton of steel produced—a considerable increase from 1942. Of the 1943 consumption, 11.7 pounds were in the form of ferromanganese, 0.7 pound as spiegeleisen, 0.6 pound as silicomanganese, and 0.3 pound as manganese ore used directly. In 1942 the consumption of manganese contained in ferromanganese, spiegeleisen, and silicomanganese amounted to 11.2 pounds, 0.6 pound, and 0.6 pound, respectively, per ton of steel; in addition, an undetermined amount of manganese ore was used.

The above data apply to the consumption of manganese ore in the manufacture of steel ingots and that part of steel castings manufactured by concerns which also produce steel ingots.

Open-hearth operations are the greatest users of manganese in the United States. Manganese is added to the open-hearth melt essentially as an alloying agent, a deoxidizer, and a desulfurizer. As an alloying agent, manganese has no marked effect on tensile strength of steel when below 0.3 or 0.4 percent. This is because other substances, especially iron oxide, mask the effect. Consequently, if the beneficial effects of manganese upon tensile strength are desired, it is important to maintain as much manganese as possible in the bath, as the amount to be added during recarburizing is reduced in direct proportion to the weight of the residual manganese.

Manganese is added to the bath near the end of the heat, in the form of a recarburizer, the original purpose of which was to raise the carbon content to the desired level. However, at present its most important purpose is to rid the bath of as much oxygen as possible. The recarburizer contains manganese, silicon, and carbon. It often consists of ferromanganese and ferrosilicon but has been replaced to some extent by silicomanganese, which is considered superior under certain conditions because the oxides formed from this alloy coalesce peculiarly and separate more easily from the steel, eliminating the so-called oxidized inclusions before the steel freezes. Unless manganese and silicon are added in quantities above that necessary to theoretically complete the oxidizing reactions, the effect will be incomplete. Consequently, the recarburizer is so calculated that about 0.50 percent manganese and 0.10 percent silicon are left in the open-hearth steel at the end of the heat.

Sulfur is eliminated from steel mainly through the formation of manganese sulfide, which separates from solution in the liquid bath and slowly rises to the surface. When in contact with a basic slag the manganese sulfide will convert to calcium sulfide and remain in the slag. As lime may be added only to basic furnaces, acid furnaces will not remove sulfur. The more manganese put in with the charge, the more sulfur is removed. For this reason, basic pig iron should be relatively high in manganese.

Ferromanganese.—The domestic output of ferromanganese in 1943, which increased 6 percent over 1942, was produced at the following plants:

Bethlehem Steel Co., Johnstown and Bethlehem, Pa.
E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Products Corporation, Rockdale and Rockwood, Tenn.
Colorado Fuel & Iron Corporation, Pueblo, Colo.
Electro Metallurgical Co., Alloy, W. Va.
United States Steel Corporation, Etna and Clairton, Pa.

In addition to the foregoing plants, shipments were made by the Jones & Laughlin Steel Corporation, Aliquippa, Pa.

Fourteen percent of the total manganese ore used in 1943 for the production of ferromanganese was of domestic origin compared with 1 percent in 1942.

Ferromanganese and spiegeleisen imported into and made from domestic and imported ores in the United States, 1942–43, in short tons

	Gross weight (short tons)	Mn content (short tons)	Value	Gross weight (short tons)	Mn content (short tons)	Value
Canada	6,453	5,040	$654,219			
India and Dependencies				2,302	990	$160,600
United Kingdom[1]	8,319	6,595	620,530			
	14,772	11,635	1,274,749	2,302	990	160,600

[1] United Kingdom of Great Britain and Northern Ireland.

The quoted price of ferromanganese (delivered Pittsburgh) decreased from $125.58 per short-ton in May to $125.29 in June as a result of a 6-percent decrease in freight, effective June 1, 1943. However, the base price at seaboard of $135.00 per long ton ($120.54 per short ton) remained unchanged.

Prices per short ton of ferromanganese in the United States, 1941–43, by months[1]

Month	1941	1942	1943	Month	1941	1942	1943
January	$111.90	$111.90	$125.58	July	$111.90	$125.58	$125.29
February	111.90	111.90	125.58	August	111.90	125.58	125.29

[1] Steel, vol. 114, January 3, 1944.

Spiegeleisen.—Production and shipments of spiegeleisen decreased 20 and 19 percent, respectively, from 1942. The decrease was due largely to the comfortable position held by ferromanganese during 1943.

Spiegeleisen produced and shipped in the United States, 1939–43

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1939	102,470	94,908	$2,484,042	1942	186,026	186,163	$5,931,728
1940	114,119	119,512	3,487,565	1943	149,036	150,136	4,827,954
1941	177,915	181,177	5,793,481				

Spiegeleisen was manufactured at the following plants during 1943:

E. J. Lavino & Co., Reusens, Va.
New Jersey Zinc Co., Palmerton, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Inland Steel Co., East Chicago, Ind.
United States Steel Corporation, Duquesne and Clairton, Pa.

All the spiegeleisen produced in the United States in 1943 was made from domestic raw materials. Imports of spiegeleisen for consumption increased 64 percent over 1942; all came from Canada.

Spiegeleisen imported for consumption in the United States, 1939–43

Year	Short tons	Value
1939	42,856	$1,329,814
1940	17,455	638,732
1941	4,741	215,108
1942	1,990	$95,853
1943	3,254	140,247

The prices of spiegeleisen (20-percent) at producers' furnaces, as quoted by Steel, remained constant at $32.14 per short ton during 1943.

Manganiferous pig iron.—Pig-iron blast furnaces used 52,067 tons of manganiferous zinc residuum and a total of 1,305,005 tons of domestic ore containing over 5 percent (natural) manganese in 1943; of this ore, 1,360 tons contained 35 percent or more manganese, 242,961 tons contained 10–35 percent manganese, and 1,060,684 tons contained 5–10 percent manganese. In addition, 18,423 tons of foreign ore containing over 35 percent manganese and 9,509 tons containing 10–35 percent manganese were used during the year.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1941–43, in short tons

Source of ore	Ferruginous manganese ore			Manganiferous iron ore		
	1941	1942	1943	1941	1942	1943
Australia				2,265	790	
Brazil	8,313	9,173

Sweden					990	
	8,313	13,950	9,509	2,265	1,780	

BATTERY AND MISCELLANEOUS INDUSTRIES

Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, copper, nickel, or cobalt, which are electronegative to zinc. Chemical ore has a wide range in analyses and a great many uses; the bulk is used in photography (in the manufacture of hydroquinone), in fertilizers, and in coloring agents for paints and ceramics.

Data covering production, imports, consumption, and stocks of such ores are given elsewhere in this chapter.

PRICES

Ceiling prices on foreign ore in effect at the close of 1942 continued throughout 1943. However, the Metals Reserve Co., which is exempt from maximum price regulations, issued a new purchasing schedule [7] which increased substantially the prices paid for certain domestic ores. Thirty-five-percent ore formerly purchased by the Metals Reserve Co. at $19.50 per long dry ton (disregarding penalties) was increased in price to $28.00 per ton. This schedule was designed to increase the price paid by the Metals Reserve Co. for ores containing just over 35 percent manganese and at the same time to maintain the previous price of $1.00 per long-ton unit ($48.00 per long dry ton) for standard 48-percent ore. This action did much to aid small producers of marginal ore.

---

[7] Metals Reserve Co., Information Concerning Purchase of Domestic Manganese Ores and Concentrates: May 15, 1943 (revised), Washington, D. C.

The average mine value reported for ore containing 35 percent or more manganese during 1943 was 73 cents per long-ton unit compared with 72 cents in 1942. Quotations on imported ore in the following table are from Engineering and Mining Journal. A duty of one-half cent per pound of contained manganese is imposed on all imported manganese ore except that from Cuba and the Philippine Islands, which enters duty free.

Domestic prices of imported metallurgical manganese ore in 1943, in cents per long-ton unit

[C. i. f. North Atlantic ports, cargo lots, exclusive of duty

	Beginning of year	End of year		Beginning of year	End of year
Brazilian, 48 percent Mn	$0.788	$0.788	Cuban (not dutiable)—Con.		
Chilean, 48 percent Mn	.788	.788	48 percent Mn	$0.900	$0.900
South African, 48 percent Mn.	.788	.788	Indian:		
Cuban (not dutiable):			50 percent Mn	.798	.798
51 percent Mn	.915	.915	48 percent Mn	.788	.788

According to Engineering and Mining Journal, prices for chemical ores per long ton in carlots at the end of 1943 were as follows: Brazilian, 80 percent MnO_2 minimum, $55.00; Javan or Caucasian, 85 percent minimum, $70 to $75; domestic, 70 to 72 percent, $45 to $50 f. o. b. mines.

WORLD PRODUCTION

Manganese ore produced in principal countries of the world, 1938–43, in metric tons[1]

---

[1] In addition to countries listed Belgium produces manganese ore, but data of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

[2] Data not available.

[3] Estimate included in total.

[4] Dry weight.

[5] Shipments by rail and river.

[6] Exports.

[7] January to September, inclusive.

[8] Estimate.

[9] Estimate excludes Ukraine.

[10] Croatia only.

[11] January to June, inclusive.

[12] Year ended June 30 of year stated.

Brazil.—Brazil continued to be second only to British India as a source of United States imports of manganese ore in 1943; however, it dropped below Cuba as a producer, because of the relatively long shipping distance from Brazil to the United States.

Virtually all the manganese-ore output of Brazil comes from the State of Minas Gerais. The two important districts of the State are the Miguel-Burnier district, 310 miles north of Rio de Janeiro on the Central Railway of Brazil, and the Lafayette (Queluz) district, about 20 miles south of Miguel-Burnier and 283 miles from Rio de Janeiro.

The Miguel-Burnier deposits consist chiefly of a mixture of psilomelane and pyrolusite, averaging 50 percent manganese, 1 percent silica, and 0.03 to 0.05 percent phosphorus. The draw-back to the district is the fact that the beds dip steeply and are relatively small in extent.

The Morro da Mina mine in the Lafayette district is the largest manganese mine in Brazil. The ore bodies lie at the top and on the flanks of a hill as a series of overlapping lenses. The ore, which consists mainly of psilomelane with manganite and pyrolusite, is mined in open cuts and is usually screened. The fine ore is the higher grade, but the coarse grade has been exported to some extent. The mine is operated by the Cia Meridional de Mineracão, a subsidiary of the United States Steel Corporation.

Cuba.—Cuba became the largest producer of manganese ore in the Western Hemisphere in 1943. Imports into the United States increased 36 percent over 1942, and the Metals Reserve Co. continued to stock-pile ore in Cuba to have manganese ore readily available without utilizing urgently needed ship bottoms. At the end of 1943, these stocks totaled 270,026 short tons. Park [8] has recently described the manganese ores of Cuba as follows:

> Manganese has been found in every Province of Cuba, but the deposits that have been most productive and that contain the largest known reserves are in Oriente Province. The Oriente deposits lie in a broad zone about the Sierra Maestra, which consists largely of Eocene volcanic rocks and limestone; with few exceptions they are either bedrock deposits in the Eocene rocks or the superficial accumulations known as granzon.
>
> The bedrock deposits are mainly either in tuff or in limestone. Their manganese minerals are mostly the oxides pyrolusite, psilomelane, and manganite. Much "bayate", or jasper, is associated with the ores, and zeolites are locally abundant. The manganese is thought to have been deposited by warm springs, which were active during the last stages of the Eocene volcanism that centered in the Sierra Maestra. Textural features show that the manganese oxides were in part deposited in open spaces—conduits of the spring waters and pore spaces in the rocks—and in part by replacement of the rocks. Some of the deposits are bedded and appear to be primary accumulations of manganese oxides, presumably derived from spring waters discharged into the sea. The lithologic character of these bedded ores indicates that they were deposited contemporaneously with the associated sedimentary rocks.
>
> The granzon ore consists of nodules or pellets of the manganese oxides found in soil or subsoil near the outcrops of the bedrock deposits. It is not concentrated in streams as gravel, but appears to be most abundant in nearly level areas or playas where surface water stands intermittently or runs off slowly.
>
> From 1888 to 1940, the Cuban deposits yielded a total of 1,237,858 long tons of manganese ore, valued at $21,386,706.

Chile.—General imports of manganese ore from Chile increased from a single ton in 1942 to 10,649 short tons in 1943. In addition, 182,953 tons were held in stock in Chile by the Metals Reserve Co.

Gold Coast.—Gold Coast was the third largest producer of manganese ore in the world in 1943. All the output (700,000 tons in 1943) from Gold Coast is supplied by the Nsuta mine, largest individual manganese producer in the world. The deposits, consisting essentially of pyrolusite and psilomelane, have been traced almost continuously from near the Sekondi-Kumasi Railroad for about 2½ miles northeast along two parallel ridges. The accessibility is unusual, the deposits being only 39 miles by rail from the port of Takoradi.

U. S. S. R.—Recent reports from the Soviet Union indicate that the 1942 production was considerably higher than estimated earlier. Excluding the Ukraine, which was occupied by enemy troops, it is estimated that 1,823,000 metric tons were produced in 1942. When this chapter was written (May 1944) no information was available on 1943 output, but it is likely that U. S. S. R. retained its position as the leading manganese-ore producer of the world.

SUMMARY

The major development in chromite in 1943 was the transition of the supply situation from one of anxiety to a comfortable working margin; it was achieved by a combination of the maintenance of foreign supplies, a peak domestic production, and the successful fruition of control actions taken by the Government war agencies.

Domestic production reached the unprecedented total of 160,120 short tons of chromite—a peak that may never again be equaled unless a similar emergency arises. Although below the quality standards normally set by industrial consumers, the output of domestic mines played an important role in guarding against disaster to foreign sources of supplies.

Supplies from abroad were lower than in either 1941 or 1942 but were high enough to provide a safe stock-pile margin under the revised stock-pile program requiring only 6 months stocks to be within the country. The almost complete defeat of the Axis attacks on shipping lanes made unlikely any recurrence of the critical supply conditions of 1941 and 1942.

Salient statistics of chromite in the United States, 1942–43

	1942		1943	
	Short tons	Value	Short tons	Value
New supply:				
Domestic production (shipments)	112,876	$2,994,081	160,120	$4,820,461
Imports for consumption	981,607	14,200,159	928,576	16,432,511
Total	1,094,483	17,194,240	1,088,696	21,252,972
Distribution:				
Consumption by industry	891,952	(1)	964,600	(1)
Exports	4,743	163,420	26,259	896,174
Additions to stocks	197,788	(1)	97,837	(1)
Total	1,094,483	17,194,240	1,088,696	21,252,972

(1) Not available.

Consumption of chromite totaled 964,600 short tons—a substantial increase over 1942 and a record level that will not be equaled in 1944 should that for the first quarter be maintained for the balance of the year.

An important feature of the international situation was the Turkish decision to halt exports of chromite to Germany. This decision, made early in 1944, may prove to be an important factor in the war, as the supply sources remaining available to Germany are not considered adequate to maintain its great demands.

Experience in the early months of 1944 suggests that domestic production probably will be less than half that for 1943. At this writing (June 1944) all but one of the six largest producers are closed and are not expected to resume operations. Imports probably will again be lower, but the almost complete freedom from Axis activity of shipping lanes to Africa—our most important source of metallurgical ore—makes this situation one to be handled on nearly peacetime standards, rather than on the driving requirements of a war emergency. Consumption for the first quarter of 1944 is lower than in the comparable period for 1943, but this condition can change overnight as losses of material on the war front or shifts in consumption patterns affect military demands.

POST-WAR OUTLOOK

The outlook for chromite indicates a higher consumption in the post-war years than in those just before the war. The backlog of postponed consumption for normal industrial and civilian uses is enormous. Construction, railroad, and automobile-industry demand, coupled with the entire reconversion program and aid toward rebuilding war-desolated countries, should elevate chromite consumption to new peacetime levels. Restraining factors—largely the result of wartime developments—such as the competition of low-alloy and heat-treated steels, competition from light metals, and the new emphasis on "performance" specifications—may create a highly competitive market, but the over-all demand should still be high. Factors affecting the supply side and as yet undeterminable in their effects will be the accessibility of foreign sources of chromite, the disposition of secondary metal (both war scrap and unused war materials), the speed of reconversion, and post-war financing problems of private industry.

WAR PRODUCTION BOARD REGULATIONS

Changes in Government controls during 1943 were largely in the nature of refinements of those previously established, except for the institution of complete allocation of chrome chemicals in September. Primary chrome chemicals for use in tanning, pigments, chromic acids, surface treatment of metals, plating, textile processing, and dyes became critically short in supply for war needs, largely because of inability to expand manufacturing capacity, coupled with labor-supply problems.

In April the War Production Board ordered a decrease in the quality of chromite used in manufacturing high-carbon ferrochromium. Under the terms of the order, producers were instructed to use chromite having a weighted chrome:iron ratio not exceeding 2.6:1. Flexibility in operations was allowed under the weighting rule; for part of a month a higher grade of chromite could be used, providing the average for the month was not over 2.6:1.

The Board also acted to reduce ferrochromium consumption; the requirement was established in February that at least 30 to 40 percent of the chromium content of stainless steel was to be obtained from scrap and ore. It was emphasized that the new economies were minimum, and producers were requested to institute even greater economies whenever possible.

Changes in the point at which control was exercised took place with regard to high-carbon ferrochromium, briquets, and high-carbon Chrom-X. Control was relinquished over consumers' stocks and placed on producers' shipments instead. Control over actual consumption was not relinquished, however.

Chromium metal for metallurgical uses was freed to some extent for the smaller consumers. Deliveries of 3,000 pounds or less to a single customer in any one month were permitted without the need for filing report forms with the Board. However, early in 1944 the supply situation for chromium metal again became critical, and the 3,000-pound free-delivery allowance was reduced to 250 pounds.

MARKET AND PRICES

Since November 1941 the Metals Reserve Co. has been the principal buyer of chromite. The original terms of purchase contracts have been lowered progressively in respect to acceptable minimum quantities and quality, but prices have been raised. The small lots purchasing program, established in March 1942, has gone through the same experience. The published purchasing terms for 1941 and 1942 are described in Minerals Yearbook for those years.

On May 15, 1943, the purchasing regulations for contract agreements were revised so that the minimum quantity became 500 long tons—a 50-percent cut from the previous minimum of 1,000 long tons.

A major revision was the elimination of detailed specifications. Before May 15 there had been various restrictions on the maximum allowable content of such impurities as silica, phosphorus, and sulfur, but these were now dropped. Only the measure of chromic oxide content and the chrome:iron ratio were retained as guides to quality, acceptability, and the price to be paid.

Price-determining specifications also were revised. The classifications of High Grade, and Low Grades A and B were discontinued in the revised price schedule. A base price was set for chromite with a chromic oxide content of 48 percent and a chrome:iron ratio of 3:1, which are traditional bench marks in commercial trade circles. Various penalties and premiums were set for deviations downward or upward from the basic assay.

A price of $52.80 was set for chromite meeting the new standard base specifications. Premiums were allowed for higher contents of Cr_2O_3 and a higher chrome:iron ratio; for each additional unit of Cr_2O_3, a premium of $1.10 per long ton was set; for each tenth of a unit increase in the chrome:iron ratio—to a maximum of 3.5:1—an increase of $1.50 per ton was allowed. Penalties were set at $1.10 per unit for each unit of Cr_2O_3 below 48 percent, with the acceptable minimum remaining at 35 percent. For decreases in the chrome : iron ratio below 3:1 there were two schedules; down to 2:1 a penalty of $1.50 per tenth was set, and below 2:1 a deduction was specified of $15.00 per ton with an additional deduction of $1.00 per ton for each tenth down to a minimum, established for the first time, of 1.5:1.

The revised specifications and price schedule were also applied to purchases under the small lot program.

During 1943 only one minor change was made in price regulations affecting chromite. On March 18 the Office of Price Administration removed price ceilings from sales of domestic ore to dealers who buy for resale to the Metals Reserve Co. This exception made available to all small producers the high prices set by the company.

Imported ores continued to be quoted at price ceilings established by the Office of Price Administration. Metallurgical-grade ore of 48 percent Cr_2O_3 and 3:1 chrome : iron ratio was quoted throughout the year at $43.50 per long ton, according to E&MJ Metal and Mineral Markets. The established price ceilings for all grades of chromite were given in Minerals Yearbook, 1942 (p. 633).

UNITED STATES

PRODUCTION IN 1943

Production of chromite (in terms of shipments from mines) in the United States reached 160,120 short tons in 1943, the highest level ever recorded. This record total was attained partly as a result of an increase in prices offered producers by the Metals Reserve Co. but mainly in consequence of the completion of several large operations that had been in a development stage for the greater part of 1942. Production from three Government operations became so large, in fact, that work was halted on all three by the end of the year. Originally planned and developed in the emergency period of 1941 and 1942, their output was too low in quality, although high in tonnage, to be longer needed, as foreign sources of supply were maintained at adequate levels in the face of wartime transportation difficulties.

The average chromic oxide (Cr_2O_3) content was 41 percent, an increase of 2 percent over 1942. The number of individual shippers was the largest on record—175—with 148 in California alone, 21 in Oregon, 4 in Montana, and 1 each in Alaska and Texas.

Chromite production (shipments) in the United States in 1943, by States, in short tons

State	Cr_2O_3, percent			Total
	45 or more	35 to 45	Less than 35	
Alaska		5,569		5.569
California	27,868	33.907	720	62,495
Montana		68,844	6,847	75,691
Oregon	876	15.487		16,363
Texas		2		2
	28.744	123,809	7,567	160,120

An increase in prices and a revision of quality standards by the Metals Reserve Co. brought out a production of approximately 41,000 tons by small operators. Virtually all the metallurgical-grade lump ore was produced by this group; 8,000 tons of this total was lump ore averaging 49 percent Cr_2O_3 content.

No refractory-grade chromite is produced in the United States—virtually all is classified as chemical grade. Consumption reports from chemical producers reveal that the industry uses chromite with an average chromic oxide content of 45 to 50 percent. The major part of domestic production does not meet the normal specifications of any consumer group.

Available geologic information and the requirements of existing industrial practice suggest that domestic deposits of chromite are not important at present in meeting demand, except in a time of national emergency when techniques must be changed, whatever the cost.

Chromite production (shipments) in the United States in 1943, by form of material, percentage of Cr_2O_3, size of individual operation, and ownership of operation (short tons)

	Cr_2O_3, percent			Total
	45 or more	35 to 45	Less than 35	
Form of material:				
Ore	8, 476	29, 646	7, 567	45, 689
Concentrates	20, 268	94, 163		114, 431
Size of individual operation:				
10,000 tons or more	20, 087	92, 592	6, 847	119, 526
Less than 10,000 tons	8, 657	31, 217	720	40, 594
Ownership of operation:				
Federal Government		69, 892		69, 892
Private enterprise	28, 744	53, 917	7, 567	90, 228

There were 169 producers with less than 10,000 tons output for the year; the average production for this group was 240 short tons. Six producers of more than 10,000 tons each—three Government and three private operations—produced nearly 120,000 tons, or 75 percent of all chromite for the year. Nearly all of this total was in the form of concentrates, of which 20,000 tons averaged 45 percent Cr_2O_3, 93,000 tons averaged 40 percent, and 6,100 tons averaged only 31 percent. The 6,100 tons with 31 percent Cr_2O_3 content were virtually the only ore produced by the large operators and were privately sold.

Alaska.—The first production of chromite ever recorded from the Territory of Alaska was made in 1943 by the Chrome Queen Mining Co. from its Red Mountain property on Kenai Peninsula near Seldovia. The deposits have been described by the Geological Survey.[1] Shipments for the year amounted to 5,569 short tons, averaging 41 percent Cr_2O_3 with a chrome: iron ratio of 2.7: 1. Owing to weather conditions, mining operations are possible only from May to early November, and shipments are made in late summer and early fall. Over 2,000 tons of ore have been blocked out for 1944 operations.

California.—The Grey Eagle property of the Rustless Mining Corporation was the largest chromite producer in California for the second successive year; output amounted to 20,087 short tons, an 80-percent increase over 1942. The crude ore averaged about 14 percent Cr_2O_3 and the concentrate over 45 percent Cr_2O_3. However, the property was reported exhausted and shut down in February 1944. The geology of the deposit has been described by Allen[2]; details of the mill and mining operations have also been published.[3]

[1] Guild, Philip W., and Balsley, J. R., Jr., Chromite Deposits of Red Bluff Bay and Vicinity, Baranoff Island: Geol. Survey Bull. 936-G, 1942, pp. 171-187.

The second largest chromite producer in California was the Castro group of mines in San Luis Obispo County, operated by the Castro Chrome Associates, Inc. The mill is at Goldtree Siding and began operations in 1942. The ore has consistently averaged 20 percent and the concentrates 42 percent Cr_2O_3, with a chrome:iron ratio of 2.5 : 1. Production in 1943 amounted to 12,553 short tons, more than double the 1942 total. The Bureau of Mines and the Geological Survey have explored the Castro and nearby deposits.[4]

Montana.—Production from Montana properties during 1943 amounted to 75,691 short tons, the largest total recorded from one State since California supplied 70,725 short tons in 1918. Only the cancellation of operations in the Stillwater complex in September by the Metals Reserve Co. prevented the State from establishing an even higher record.

The output of the 400-ton Benbow mill, established in 1942, was supplemented by a new 1,000-ton mill at the Mouat-Sampson properties, which began operation in May 1943. The mill output at Benbow amounted to 28,437 short tons of chromite with a Cr_2O_3 content of 41.45 percent and iron of 22.6 percent. The crude ore averaged 18.34 percent. At Mouat-Sampson the output was 29,538 short tons, averaging 38.8 percent Cr_2O_3 and 24.7 percent iron. The crude ore averaged 19.26 percent Cr_2O_3. At both mills considerable quantities of crude ore remained to be processed at the time of closing down.

The North Star group in Carbon County, operated by the United States Vanadium Corporation, also shipped considerable quantities of chromite during the year. More than half the shipments were in the form of concentrates, averaging about 36 percent Cr_2O_3; the remainder was low-grade crude ore averaging 31 percent Cr_2O_3.

Oregon.—The output of Defense Plant Corporation at Coquille, which treated beach-sand concentrates, was the only large tonnage contributed by an individual operation.

Oregon beach sands.—The deposits are scattered along the Pacific coast of Coos and Curry Counties from Port Orford on the south to Marshfield on the north; they may be situated anywhere from within 1 mile to 3 miles from the shore line. These beach placers were discovered in 1852 and were originally worked for their gold content. After an initial period of intensive activity the deposits were worked only spasmodically. The presence of chromite in the sands has been known for many years, but not until 1941[5] was systematic exploration started to outline the deposits and determine their grade.

[4] Department of Interior Information Service, Chromite Deposits near San Luis Obispo, Calif.: Press Notice 8533, December 1942, 2 pp.

The geology of the area has been discussed by Pardee.[6] Concentrations of black sand containing chromite, magnetite, ilmenite, and other heavy material were formed by wave action along the old beaches and offshore benches. The coast was subsequently elevated and the shore line receded, leaving the deposits 170 to 400 feet above the shore line and 1 mile to 3 miles inland.

The sands occur as flat-lying strata ranging in thickness from 1 foot to 35 feet. They are generally elliptical, although some are quite irregular. In places where they have been left intact from erosion, they are 1,000 to 2,000 feet long and 100 to 500 feet wide. The greatest thickness and the best grade of material are generally near the center of the deposit; toward the edges the strata feather out and decrease in grade. Overburden consists of barren marine sands, topsoil, and clay and ranges from 1 foot to 20 feet in thickness.

Developed reserves in early 1943 amounted to 1,500,000 tons, with another 1,200,000 considered probable. The material as mined ranged from 5 to 10 percent Cr_2O_3 content, with the average slightly above 6 percent. Primary concentration was by tabling or jigging, with tabling preferred, and produced a concentrate ranging from 20 to 25 percent Cr_2O_3, a ratio of concentration of 5:1.

The Humphreys Gold Corporation developed a gravity concentration device, called the "Humphrey's spiral," which has attracted considerable attention.[7] With a capacity of 840 short tons of sands a day, the company processed an estimated 240,000 short tons of sand from May 13 to December 6, 1943, when the plant was closed as a result of contract cancellation by the Metals Reserve Co. A total of 47,667 short tons of concentrates was produced during this period, with an average of 25.09 percent Cr_2O_3.

The Krome Corporation worked the largest deposit[8] and with a daily mill capacity of 1,120 short tons processed 260,930 short tons of sand and produced 40,173 short tons of concentrates averaging 24.05 percent Cr_2O_3.

The output of both Humphreys Gold Mining and Krome Corporation was shipped to a special plant erected at Coquille, Oreg., by the Defense Plant Corporation and operated for the Government by the Southwestern Engineering Co. Secondary concentration at this plant resulted in an output of 11,918 short tons of chromite averaging 39.3 percent Cr_2O_3, with a chrome:iron ratio of approximately 1.6:1. Operations were halted in December at the order of the Metals Reserve Co., and the plant was placed in stand-by condition. Considerable stocks of primary concentrates remain on hand awaiting future disposition.

EXPLORATION AND DEVELOPMENT

The record domestic production of 1943 was the culmination of the exploration and development done in the previous 2 years by private enterprise and Federal agencies. The Mouat-Sampson deposit in Stillwater County, Mont., and the beach sands in Coos and Curry Counties, Oreg., reached the production stage and contributed a large share of the year's total output.

The details of the Mouat-Sampson project and its companion operation at Benbow have been described previously. The Oregon beach sands were the subject of the largest development done in 1943. The Bureau of Mines completed its work on test-drilling the area, and extensive experiments were carried out to improve the Cr_2O_3 content and increase the chrome:iron ratio. A report on this work is expected to be published in the near future.

Other work was done by the Bureau in Georgia and California, but very small tonnages were proved. Work on the Red Mountain deposit on Kenai Peninsula in Alaska was continued and a confidential report prepared.

The Geological Survey completed field work on chromite deposits in the Red Lodge and Stillwater districts of Montana and the beach sands of Oregon. The Survey estimated that 20,000,000 tons of low-grade chromite are available in the Stillwater complex. Geologists of the Survey cooperated with the Bureau of Mines in examining the McCormick mine in California. Many other small deposits in the Pacific States were explored. The Red Mountain deposit in Alaska was also reexamined after the Chrome Queen Mining Co. had done considerable mining and development. The exposures thus made accessible were interpreted by Survey representatives.

During the year the Geological Survey released geologic descriptions and maps of the following properties: The High Plateau and Little Castle Creek deposits in California; the Red Lodge and Silver Star deposits in Montana; the Twin Sisters Mountains deposit in Washington; and the Camaguey Province deposits of Cuba. The last project was in cooperation with the Cuban Government.

HISTORICAL SURVEY OF SUPPLY

The relative growth of the total supply of chromite and the proportion of domestic production to total supply are given below. Averages of 5-year periods were used, and the World War I period, 1916–20, was taken as 100 percent. Other periods were related to this base period upon a percentage basis. In addition, the actual percentage of domestic production in the total supply is given.

Comparison of relative changes in total supply and domestic production, 1891–1943, and relation of domestic production to total supply, in percent

Period	Total supply	Domestic production	
	Relatives	Relatives	Percent of total supply
1891-95	5	5.0	28.5
1896-00	10	.5	1.3
1901-05	24	.5	.6
1906-10	28	.9	.8
1911-15	46	2.0	1.4
1916-20	100	100.0	26.5
1921-25	84	.7	.2
1926-30	191	.7	.1
1931-35	128	1.0	.2
1936-40	325	.5	.04
1941-43	724	236.0	8.7

The use of 1916–20 as a base allows an illustration of the growth in the supply (and demand) of chromite between the First and Second World Wars. Total supply for World War II is over seven times greater than in World War I. Another feature deserves comment: Domestic production in 1941–43 is more than twice as great as in the World War I period, but its relationship to total supply has declined from 26.5 percent to 8.7. In peacetime years domestic production is a negligible factor in supply.

CONSUMPTION

The consumption of chromite reached an all-time high in 1943; the total was 964,600 short tons, an 8-percent gain over 1942. The increase took place almost entirely in the consumption of metallurgical-grade material.

In assembling the data it was necessary to define grades in terms of consumer groups having known end products. Thus in the table the data for metallurgical chromite are actually the total consumption by producers of ferrochromium and other chromium-containing metal products rather than a definition set by rigid chemical analyses. Similar standards were applied in the refractory and chemical groups.

Consumption of chromite in the United States, in short tons, and average quality of chromite consumed by primary consumer groups, 1940–43

	Total consumption (short tons)	Average Cr_2O_3 contained, by primary consumer groups (in percent)		
		Metallurgical	Refractory	Chemical
1940	562,915	50.5	35.8	47.2
1941	800,290	50.1	34.8	46.3
1942	891,952	48.5	34.0	44.8
1943	964.600	48.5	34.0	44.7

A feature to be noted in the data is the degradation of material consumed in terms of chromic oxide contained, which was brought about largely by the desire of the War Production Board to lower standards to basic essentials, thus preventing overconsumption as to quality and at the same time conserving the national stock position. The development of National Emergency alloy steels, with lower chromium contents than normal peacetime alloy steels, effected a considerable saving in metallurgical chromite. This subject was discussed in a series of 13 papers by Gillett.[9] The debasing of consumed chromite reached its lowest levels in the second and third quarters of 1942, when Axis obstruction of shipping lanes was at a peak. Since then an improvement in shipping has resulted in slight relaxation of the degradation process.

The 114-percent increase in consumption by metallurgical users from 1940 to 1943 is a striking commentary on the war program. Consumption by refractory users increased 45 percent from 1940 to 1943.

Chemical-industry consumption of chromite has been relatively stable since 1940 upon a tonnage basis—the gains of the other two groups were not paralleled by the chemical group, as its proportional share of the total consumed declined from 20.9 to 13.0 percent. Inability to expand manufacturing capacity rapidly was the chief cause of the chemical industry's relative decline; in 1943 the supply of chrome chemicals became so tight that the War Production Board was forced to place them under allocation.

Of outstanding significance for the future has been the increased consumption of chromium metal. Domestic consumption has increased greatly since 1939. The demand for chromium metal is now supplied entirely from domestic manufacture, whereas before 1939 the material was supplied largely by Germany, Norway, and the United Kingdom.

IMPORTS AND EXPORTS[10]

Imports of chromite in 1943 declined for the second successive year from the high of 1941 but were at a level high enough to maintain a good supply condition. The total of 928,576 tons of all grades was a decline of 5 percent from 1942 and 17 percent from 1941.

[1] See note below.

[2] Listed as French Oceania by U. S. Department of Commerce.

[3] Revised.

NOTE.—For the first time the countries of origin in Africa are identified in this table. This required arbitrary assignments of certain tonnages to overcome limitations of official information on imports.

Of the countries grouped under "Other British West Africa" by the U. S. Department of Commerce only Sierra Leone is a known source of chromite; therefore a substitution of names has been made by the Bureau of Mines in reproducing the data.

Before 1942 Southern Rhodesia was included in the group title "Other British South Africa." As the only other South African source—the Union of South Africa—has been regularly identified and credited with the tonnages it supplied, it was decided to allocate imports under the heading of "Other British South Africa" to Southern Rhodesia.

Two other adjustments were necessary in regard to Southern Rhodesia. In 1941 and 1942 Mozambique was credited as the source of imports of 15,624 tons and 11,319 tons, respectively. Mozambique is not a source of chromite, except as a shipping point. Therefore, taking cognizance of the chemical analyses of the chromite in question and with the knowledge that chromite from the Union of South Africa has been regularly assigned—even though this chromite moves through Mozambique for the most part—it was decided to allocate these two tonnages to Southern Rhodesia as the most probable source.

One further adjustment was necessary. In 1942 Anglo-Egyptian Sudan was credited by the U. S. Department of Commerce as the source of 2,152 tons of chromite. Such a source is most unlikely, according to other available information. Shipping facilities in the eastern Mediterranean were subject to war-caused disruptions at the time, and a review of other information suggested that this tonnage probably originated in Turkey. It has been so allocated in the table.

These revisions are by the authors.

Ferrochromium imports in 1943 were from Canada only and amounted to 10 short tons of grades containing 3 percent or more carbon and 305 tons of grades with less than 3 percent carbon. Import figures on ferrochromium for 1942 have been revised, although the total is still from Canada; the total in 1942 for grades containing 3 percent or more carbon was 5 short tons, with 377 tons of grades containing less than 3 percent carbon. It is believed that all imports from Canada are entirely of a material known in trade circles as Chrom-X,[11] a patented product developed by a Canadian company to utilize low-grade ores to produce a material similar to standard ferrochromium.[12]

Exports of chromite in 1943 amounted to 26,259 short tons, the highest total ever recorded and a gain of over 450 percent from the previous year. The largest total for an individual country was 22,226 short tons exported to Canada, followed by 3,955 tons to the United Kingdom. The remainder of the exports was entirely to South American countries and the Canal Zone.

Ferrochromium exports amounted to 2,360 short tons, of which the greater part went to the U. S. S. R.; Australia received the second largest quantity.

WORLD PRODUCTION

World production of chromite, 1939–43, by countries, in metric tons

[12] McDonald, J. H., Use of Chrom-X in Steel Making: Metals and Alloys, vol. 15, No. 2, February 1942 p. 249–253.

Albania.—The largest chrome mines in Albania—all surface operation—are in the vicinity of Kukes and Kruma in the northeastern section of the country and near Pogradec Cedilla on the western shores of Lake Ochrida. It is reported that the ore has a 50 percent Cr_2O_3 content. Another chrome mine was being operated near the town of Prishtina in the new Kossovo district, that is, in the territory that was Yugoslav until 1941 and had been occupied by the Italian forces. It is stated that during the war all the Italian chrome requirements were supplied from the mines in the Kossovo district. Part of the ore extracted from these mines was also shipped to Germany.

Canada.[13]—The leading chromite producer in Canada during 1943 was the old Reed-Belanger property—now known as Chromeraine and operated by the Wartime Metals Corporation, Canadian counterpart of the Metals Reserve Co. in the United States—located near Black Lake. The St. Cyr [14] deposit near Richmond—known in World War I as the Sterrett mine—which is now operated by Chromite, Ltd., was the second largest producer. Both operations are in the Eastern townships of Quebec Province.

At Chromeraine an extensive program of drilling and underground investigations indicated that over a million tons of milling-grade ore were available, and a 600-ton mill was erected in the spring. The mill is reported to be doing custom milling for many smaller operators.

At the St. Cyr deposit favorable indications prompted the erection of a mill of 100 tons capacity in 1941; it was increased to 150 tons in late 1942.

The Bird River discovery in Manitoba continued to be the subject of considerable field work and laboratory testing. J. D. Bateman [15] has described the deposits. Many operators have staked claims, and several companies have acquired large holdings through purchases and leases of claims from others. At the end of 1943 little work was being done pending the results of extensive laboratory work designed to increase the chrome:iron ratio of the ore above 1.2:1. Uncertainty regarding the future of the Government purchasing program also deterred actual operations.

Cuba.—Production of refractory-grade chromite tapered off in the last quarter of 1943 as contracts expired. New contracts for 1944 were said to involve a smaller quantity of ore than in 1943, with maximum expected production about 65 to 75 percent of 1943. Many smaller mines were worked out, and prospecting and development declined to a low point as a result of the lower demand. Shipping stocks and ore reserves were still at a high level, however.

[15] Bateman, J. D., Bird River Chromite Deposits, Manitoba: Canadian Min. and Met. Bull., Trans., vol. 46, No. 374, June 1943, pp. 154-183.

Japan.—Large new veins of chrome ore, reportedly averaging 50 percent metal content, have been discovered by a field party exploring in the Sarugun district, Hokkaido, according to a Japanese radio announcement.[16]

North and South America.—Results are given of 52 complete and 144 partial analyses of chromite from deposits in Alaska, Canada, Mexico, Cuba, Guatemala, Venezuela, Colombia, Brazil, and the United States. The analyses show, in general, the grade of chromite at the various localities studied, and the complete analyses are used to interpret isomorphism in chromites. The study was made as a part of the strategic minerals program conducted by the Geological Survey and the Bureau of Mines.[17]

Southern Rhodesia.[18]—A description has been given of a concentrator erected to treat the rejected material obtained after lumpy metallurgical ore was sorted at the Railway Block mine, Selukwe, Southern Rhodesia. The mill has a capacity of 120 long tons per 24 hours and is said to produce clean, small metallurgical-grade ore, as well as chemical-grade concentrates. The mill feed for the whole plant averages 36 percent Cr_2O_3, and for the gravity plant 40 percent Cr_2O_3; recoveries average 75 percent in the mill and 70 percent in the gravity plant. Three Europeans and 160 natives—including 110 sorters—are employed.

Turkey.—Preliminary estimates show that in 1943 Turkey exported 56,000 metric tons of chromite to the United Nations and 47,000 tons to Germany. During the first 2 months of 1944 Germany is said to have received 14,800 tons, but only 1,870 tons went to the United States. All exports of chromite to Germany under the Claudius agreement were said to have been halted after February 1944.

Union of South Africa.[19]—The new plant of Marble, Lime & Associated Industries, Ltd., for the manufacture of chrome chemicals in South Africa has been completed. Since the capacity of the new factory now exceeds domestic requirements, an export trade has been started.

NICKEL

By H. W. Davis

SUMMARY OUTLINE

	Page		Page
Summary	638	Production	640
Salient statistics	638	Foreign trade	640
Post-war outlook	639	World production	642
War regulations	639		

SUMMARY

Shifts in military demands and greater use of low-alloy as compared with high-alloy steels prevented a shortage of nickel in 1943. Nevertheless, the consumption of primary nickel was about 6 percent greater than in 1942. Imports of nickel in all forms exceeded those in the previous peak year 1942 by 7 percent. A substantial saving in nickel was accomplished by the use of NE steels, which contain 0.2 to 0.7 percent nickel, and by the recovery of nickel scrap. According to Work:[1]

> In 1943 approximately one-third of the alloy steels produced were NE steels, a step that is credited with saving 24,000 tons of nickel at a small cost in manganese and molybdenum. Another 10,000 tons of nickel was saved by careful attention to the recovery of the residual alloys in scrap. This has been accomplished by the vigilant segregation and re-use of alloy scrap despite the fact that scrap with two or three alloy components is presenting considerable difficulty.

As insufficient labor was available to operate the expanded mine and plant capacity, the production of nickel in Canada in 1943 was only slightly more than in 1942. Production in New Caledonia, the second-largest producing country, declined substantially. The new plant of the Nicaro Nickel Co. in Cuba made its initial output of nickel oxide in December 1943.

---

[1] Work, H. K., Steelmaking: Metals and Alloys, vol. 19, No. 1, January 1944, p. 69.

As heretofore, the domestic output of primary nickel was insignificant in 1943.

The St. Louis Smelting & Refining Co. continued development at its properties near Fredericktown, Mo., where nickel and cobalt occur with lead, copper, and iron. A mill was under construction.

The new cobalt-nickel plant of the Ferro Enamel Supply Co., Cleveland, Ohio, began operating in September 1943 on Burmese speiss, which contains about 30 percent nickel, 7 percent cobalt, 40 percent arsenic, and 10 percent copper.

A process for separating nickel and cobalt in solutions is the subject of United States Patent 2,290,313.

Possible new sources of nickel were discussed by Pawel.[2]

POST-WAR OUTLOOK

The post-war outlook for nickel has been ably discussed in Engineering and Mining Journal,[3] as follows:

> Nickel will come out of its Second World War experience with a much more favorable post-war outlook than it enjoyed 25 years ago. At that time it had the dubious reputation of being primarily a munitions metal; but in the interim it has found such extensive industrial uses that producers can now look forward to supplying well-established peacetime markets. Consumption of the metal will naturally recede from it wartime peak. But when restrictions on use are removed, there is likely to be an extraordinary demand to satisfy the pent-up industrial market. Thereafter, production and consumption will revert to a more normal state. The increased use of nickel in war applications is likely to be reflected in peacetime demand, and some new uses will appear that cannot now be revealed.
>
> With a few exceptions the pattern of post-war nickel consumption will not differ greatly from that of pre-war. It is in the variety of nickel alloys that the largest consumption occurs. Alloy steels head the list and may account for two-thirds of total consumption. Best known are the stainless steels. Although the development trend has been toward lower nickel content in alloy steels, it is nevertheless believed that the markets for nickel alloy steels have been broadened and will result in an increased consumption of nickel.
>
> The increasing use of high-temperature industrial processes will afford an expanding market for nickel-alloy steels. Nickel cast irons also are growing in favor where abrasion resistance is desired. Nickel plating is a field that is likely to expand, and nickel-clad metals will probably grow in favor. Alloys of nickel and the nonferrous metals will doubtless show substantial growth. In short, the post-war outlook for nickel can be regarded as favorable.

WAR REGULATIONS

Distribution of Canadian nickel matte and metal is controlled by the Canadian Government, but in accordance with recommendations of the Combined Raw Materials Board. Distribution of primary nickel and secondary nickel (except nickel contained in iron and steel scrap) in the United States is under complete allocation (General Preference Order M–6–a through c, as amended). The quantity of matte used to make Monel metal is determined quarterly by the Combined Raw Materials Board. All nickel-control programs are effected largely through the International Nickel Co., the major operator in Canada and the United States, which also refines the matte received from New Caledonia. By Order M–21–a the War Production Board controls the proportions of alloying elements, including nickel, that may be used in making alloy iron and steel.

[3] Engineering and Mining Journal, Metals for the Alloy Steels: Vol. 145, No. 2, February 1944, p. 84.

PRODUCTION

Domestic production of nickel is small and comprises secondary metals recovered from scrap-nickel anodes, nickel silver, and copper-nickel alloys (including Monel metal), and primary metal recovered in copper refining and produced from ore and as a byproduct of talc production, as listed in the following table. Domestic primary nickel was recovered in 1943 as a byproduct in copper refining at Baltimore, Md., Laurel Hill, N. Y., Perth Amboy, N. J., and Tacoma, Wash. Concentrates containing 10 percent nickel and 0.7 percent cobalt were recovered as a byproduct of talc production in Vermont; however, none was shipped.

Nickel produced in the United States, 1939–43

Year	Primary (short tons)[1]		Secondary[2]	
	Byproduct in copper refining[3]	Other[4]	Short tons	Value
1939	394		2,920	$2,044,000
1940	554		4,152	2,906,400
1941	619	41	5,315	3,720,500

FOREIGN TRADE[4]

The nickel imported into the United States in 1943 established a new peak and was 7 percent greater than in 1942, the previous record year. Imports comprised chiefly metallic nickel, matte, and oxide. As heretofore, Canada was the chief source of the imports; it supplied 184,265,773 pounds of metallic nickel, 70,271,479 pounds of matte, and 10,267,463 pounds of oxide. Most of the matte from Canada contained 54 to 55 percent nickel and 25 percent copper and was refined to Monel metal and other products at the plant of the International Nickel Co., Inc., at Huntington, W. Va. Some roasted matte containing about 75 percent nickel was received from Canada in 1943; and it, with virtually all of the oxide, was refined to nickel at Huntington. About 7,200 short tons of nickel were produced at Huntington from Canadian materials in 1943. During the year 2,297,994 pounds of electrolytic nickel were received in the United States from French Morocco; of this quantity, 1,459,705 pounds were classified by the United States Department of Commerce as "ore and matte." This metal was originally produced in Canada. New Caledonia supplied 14,257,847 pounds of matte; it contains about 78 percent nickel and is also refined at Huntington. About 5,200 short tons of nickel were produced from New Caledonian matte in 1943. Brazil and Cuba furnished 665,379 and 317,049 pounds, respectively, of ore in 1943. The Brazilian ore was shipped to Perth

---

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the United States Department of Commerce.

Amboy, N. J., where the American Smelting & Refining Co. is testing its treatment process upon this ore in a pilot plant. The United Kingdom supplied 100,757 pounds of oxide and 52,830 pounds of metallic nickel in 1943.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 244,983,000 pounds in 1943 compared with 228,550,000 pounds in 1942.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloys (including Monel metal) and scrap were 25 percent greater in 1943 than in 1942, and exports of metallic nickel were 54 percent larger. Exports of nickel-chrome electric resistance wire declined 10 percent. The United Kingdom (10,292,752 pounds), U. S. S. R. (6,020,709 pounds), and Canada (1,155,888 pounds) were the chief markets for nickel, Monel metal, alloys, and scrap in 1943.

Nickel (excluding residues) imported for consumption in the United States, 1941–43, by classes

Class	1941		1942		1943

WORLD PRODUCTION

Because of restriction on the publication of statistics by many governments, few figures have become available since 1939.

World production of nickel (content of ore), 1937–43, by countries, in metric tons[1]

[Compiled by B. B. Waldbauer]

Country [1]	1937	1938	1939	1940	1941	1942	1943

[1] In addition to countries listed, Cuba, Finland, Japan, and Sweden produce nickel, but data of output are not available.

[2] Data not yet available; estimate included in total.

[3] Excludes small quantity produced in British Columbia.

[4] Estimate.

[5] Byproduct in electrolytic refining of copper. In 1941 includes also small quantities produced from ore and as byproduct of talc.

[6] Revised figure.

Brazil.—At the Tocantins nickel deposit, in the State of Goyaz, in which the American Smelting & Refining Co. has a 50-percent share interest, no actual development was done during 1943, as it first requires the construction of a good truck road from Anapolis at the railhead into the property, a distance of about 155 miles. Late in 1943 the Brazilian Government authorized construction of the road, and work thereon was to have been started early in 1944. To thoroughly test its treatment process upon the ore, the American Smelting & Refining Co. shipped about 500 tons of average Tocantins nickel ore and constructed at its Perth Amboy (N. J.) works a pilot plant of 5 tons daily capacity. The pilot plant has been operating upon this ore since the fall of 1943, and is continuing to do so. Work is also proceeding upon the construction of a warehouse, an administration building, and a transit house at the railhead at Anapolis.

Canada.—Virtually all the Canadian output is derived from copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of Cobalt and other areas in northern Ontario. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Production in Canada was 143,882 short tons in 1943 compared with 142,606 tons in 1942.

According to the International Nickel Co. of Canada, Ltd.:[5]

> Deliveries of nickel in all forms derived from our own mine production amounted in 1943 to 265,000,000 pounds, representing an increase of 55,000,000 pounds over 1939. In order to provide this enlarged supply, the tonnage of our ore mined was

---

[5] International Nickel Co. of Canada, Ltd., Annual Report: 1943, p. 4.

forced from 7,273,000 tons in 1939 to 12,105,000 tons in 1943. Had it not been for shortage of manpower during the last 6 months of the year the production would have been appreciably higher. As an emergency war measure we have also refined a volume of nickel originating from the mines of others. Our own deliveries, together with this volume refined for others, totaled nearly 300,000,000 pounds.

Tonnage of ore hoisted and of metals produced by Falconbridge Nickel Mines, Ltd.,[6] in 1943 was substantially higher than that recorded for any previous year. Ore treated in 1943 totaled 807,048 short tons (771,619 tons in 1942) and comprised 514,724 tons of milling ore and 292,324 tons of smelting ore. The ore treated averaged 1.62 percent nickel in 1943 (1.60 percent in 1942). Matte produced in 1943 contained 11,597 tons of nickel (10,789 tons in 1942). Ore reserves were 12,289,000 tons averaging 1.74 percent nickel on December 31, 1943. A new second blast furnace was started in March 1943.

In 1943 copper-nickel ore was shipped to the International Nickel Co. of Canada, Ltd., from the Moose mine of the Ontario Nickel Corporation, the Harlin (formerly Alexo) mine of Clifton Consolidated Mines, Ltd., and a property of Nickel Offsets, Ltd.

Cuba.—Construction of the plants for the production of nickel which the Nicaro Nickel Co., a subsidiary of the Freeport Sulphur Co., undertook for the United States Government, was substantially completed, and production of nickel was begun in 1943.[7] The plants are in Oriente Province, Cuba, and Wilmington, Del.

The operation involves open-pit mining of extensive deposits of silicate ore containing nickel, about 8 miles inland from the plant at Lengua de Pajaro, which is on deep water. After being crushed, dried, and ground to a very fine mesh, the dry dust is reduced in oil-fired furnaces, and the resulting reduced ore is leached in an ammonia solution from which the nickel is precipitated in the form of nickel carbonate. The nickel carbonate is in turn calcined to nickel oxide, which is shipped to the refinery at Wilmington, Del., where it is converted to nickel in electric furnaces.

Greece.—According to Berry:[8]

> The mining of nickel from the lentil-formed deposits in chalky stone near Larimna in Lokris, not far from Lake Kopais, has grown in importance. The raw ore goes mainly to Germany for processing. The ore is in widely scattered deposits of gabbro and peridotite stone, which have been partially serpentinized, and there are layers of nickel silicates with 4 to 8 percent nickel and 0.1 percent cobalt.

COBALT

By H. W. Davis

SUMMARY OUTLINE

	Page		Page
Summary	644	Foreign trade	645
Post-war outlook	645	Uses	647
Production and development	645	World production	647
Consumption	645		

SUMMARY

Although consumption of cobalt metal, oxide, salts, and driers was 32 percent greater in 1943 than in 1942, supplies were more than adequate to meet the controlled requirements. Consumption of cobalt in stellite and stellite-type alloys and in magnets and magnet steels increased markedly in 1943; these uses accounted for two-thirds of the total. The quantity used in high-speed steel declined substantially. Consumption of cobalt in alloy, ore, and speiss was 5 percent more than in 1942; and, as heretofore, most of it was supplied by imports (which established a new record), mainly alloy from Belgian Congo. Considerable cobalt ore was received from French Morocco in 1943, but none of it was processed. Domestic production is still comparatively small and was at about the same rate as in 1942. The new cobalt-nickel plant of the Ferro Enamel Supply Co., Cleveland, Ohio, began operating in September and made its initial production of cobalt oxide in November 1943; during 1943, 206,724 pounds of Burmese speiss, which contains about 7 percent cobalt, 30 percent nickel, 40 percent arsenic, and 10 percent copper, were charged into the system.

General Preference Order M–39, as amended by the War Production Board on March 9, 1943, placed cobalt under complete allocation. The supply position improved remarkably during the latter part of 1943, and as a consequence the allocation of cobalt was discontinued, effective December 30, 1943.

Domestic quotations for metal in 100-pound lots and for black oxide in 350-pound lots remained unchanged throughout 1943 at $1.50 and $1.84 a pound, respectively. These prices have been in effect since the latter part of October 1939. On November 2, 1943, the Office of Price Administration established maximum prices for cobalt metal, fines, powder, oxides, and other alloys and compounds of cobalt. The maximum price for metal containing a minimum of 97 percent cobalt was established at $1.50 to $1.57 a pound on contract and $1.60 to $1.67 on spot sales. The maximum prices for the other cobalt products were the highest charged by a seller on a delivery made during January, February, or March 1942. Cobalt ores, concentrates, and crudes were exempt from the provisions of the price regulation.

POST-WAR OUTLOOK

The post-war consumption pattern of cobalt in the United States will, with a few exceptions, probably not differ greatly from that of the pre-war, when the bulk of the cobalt was used for metallic purposes. However, as wartime restrictions were placed on many nonmetallic uses of cobalt, such, for instance, as ground-coat frit, a substantial increase in consumption for these purposes should result after the war. Because domestic production is relatively small and is not likely to increase greatly, the United States, as heretofore, will have to depend on foreign sources, probably Belgian Congo, for most of its requirements.

PRODUCTION AND DEVELOPMENT

The Bethlehem Steel Co., Bethlehem, Pa., was again the chief producer of cobalt ore in the United States. Production by this company was about the same in 1943 as in 1942, but shipments were 15 percent greater; the cobalt (averaging 1.34 percent in 1943) is contained in the sulfides that accompany the magnetite mined at Cornwall, Pa. The Eastern Magnesia Talc Co., Inc., Burlington, Vt., recovered 23 short tons of concentrates, containing 322 pounds of cobalt and 4,600 pounds of nickel, as a byproduct of the froth flotation of talc. The Sullivan Mining Co., Kellogg, Idaho, recovered 77 short tons of residues, containing 6,279 pounds of cobalt, at its electrolytic zinc plant. However, these two latter companies made no shipments in 1943.

The St. Louis Smelting & Refining Co. continued development and almost completed a mill at its properties near Fredericktown, Madison County, Mo., during 1943. The mill is expected to be in operation in early 1944.

According to Press Notice 29350, October 28, 1943, of the Bureau of Mines—

> Exploratory work by the Bureau of Mines has revealed more than 200,000 tons of copper-cobalt-gold ores in the Blackbird district of Lemhi County, Idaho, and a further search now under way may disclose the largest cobalt-ore reserves in the United States, as well as substantial tonnages of copper.

CONSUMPTION

Consumption of cobalt contained in alloy, ore, and speiss was 5,394,000 pounds in 1943 compared with 5,161,000 pounds in 1942. Of the consumption in 1943, about 88 percent was processed to metal, oxide, and hydrate and 10 percent to driers and salts; 2 percent was used in magnets and magnet steels.

FOREIGN TRADE[1]

Imports.—Imports of cobalt into the United States established a new record in 1943; they were 36 percent greater than in 1942 and 15 percent more than in 1941, the previous record year. The chief source of imports in 1943 was Belgian Congo, which supplied 10,110,879 pounds in the form of an alloy containing 4,357,335 pounds of cobalt.

---

[1] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the United States Department of Commerce.

French Morocco supplied 8,873,156 pounds of ore containing 1,098,228 pounds of cobalt. The ore from French Morocco contains also 5 to 30 grams of gold per ton, but none of it was processed in 1943 because of certain metallurgical problems involved in recovering both the cobalt and the gold and also because the supply situation was not serious enough to necessitate the solution to these problems. The imports of ore credited to Algeria and India by the United States Department of Commerce have been included in the total shown for French Morocco, inasmuch as the ore was mined in that country; moreover, the imports credited to India, recorded as 200,000 pounds containing 76,480 pounds of cobalt, have been corrected by the author to 184,000 pounds containing 22,100 pounds of cobalt. Canada supplied 256,670 pounds of metal, 58,928 pounds of oxide, and 1,693,525 pounds of ore containing 268,256 pounds of cobalt.

Cobalt imported for consumption in the United States, 1939–43, by classes[1]

Year	Alloy			Ore			Metal	
	Pounds		Value	Pounds		Value	Pounds	Value
	Gross weight	Cobalt content		Gross weight	Cobalt content			
1939				611,083	(²)	$54,446	2,130,296	$2,711,677
1940	7,843,828	(²)	$3,364,294	2,653,891	(²)	296,575	130,321	207,345
1941[1]	9,970,589	4,064,276	4,330,085	2,443,725	262,653	257,702	554,030	842,288
1942	[3] 10,313,867	[3] 4,188,687	[3] 3,971,056	834,797	91,597	99,898	148,304	228,452
1943	[4] 10,110,879	[4] 4,357,335	(²)	10,566,681	1,366,484	1,723,565	256,670	358,948

Year	Oxide		Sulfate		Other salts and compounds	
	Pounds	Value	Pounds	Value	Pounds	Value
1939	680,644	$944,836	75,290	$34,343	1,374	$3,405
1940	756,759	1,124,554	11,468	7,818		
1941	38,002	55,120	4,480	3,779	500	885
1942					200	448
1943	58,928	95,463			56	164

[1] In addition to classes shown, 4,796,000 pounds of Burmese speiss, containing 335,721 pounds of cobalt, were reported by the processor to the Bureau of Mines as imported in 1941; value not available.

[2] Data not available.

[3] Includes 2,384,915 pounds of alloy, containing 980,000 pounds of cobalt and valued at $867,799, received in December 1942 but recorded as January 1943 by the United States Department of Commerce.

[4] Reported by importer to Bureau of Mines

Exports.—Exports of cobalt are relatively small, as is evident from the following table:

Cobalt exported from the United States, 1942–43, by classes

Class	1942		1943	
	Pounds	Value	Pounds	Value
Ore and concentrates	1,052	$1,015	38,755	$58,182
Metal and alloys	90,679	135,229	368,989	537,664
Oxide	12,079	18,540	14,699	29,105
Salts and compounds	15,056	7,255	20,836	17,955

USES

The largest single use of cobalt is in stellite or stellite-type alloys, which contain 45 to 55 percent cobalt, 30 to 35 percent chromium, and 12 to 17 percent tungsten; there are various modifications of this composition, but all contain high percentages of cobalt. These alloys absorbed about 43 percent of the total cobalt consumed in 1943. The second-largest use is in magnets and magnet steels, which utilized 23 percent of the total cobalt consumed. Other important applications are in high-speed steels and other cutting-tool materials, valve steel, welding rod, and carbide-type alloys; these outlets comprised about 14 percent of the cobalt consumed. Smaller quantities are employed in the ceramic industry, in the preparation of driers, in electroplating, as a catalyst, and for a variety of other uses; of the total cobalt consumed, 13 percent was used in driers, 3 percent in ceramics, and 4 percent for electroplating, catalyst, and other applications.

WORLD PRODUCTION

As cobalt productioon data for many countries are lacking, it is impossible to prepare an accurate statement of world output. The following table shows world production by countries, 1938–43, insofar as statistics are available.

World production (partly estimated) of cobalt, 1938–43, by countries, in metric tons [1]

[Compiled by B. B. Waldbauer]

Country [1]	Cobalt-bearing material	Cobalt content					
		1938	1939	1940	1941	1942	1943
Australia	Cobalt ore	(3)	(2)	(3)	(3)	5	(3)
Belgian Congo	Cobalt alloy	1,532	(2)	[4] 1,423	[4] 1,844	[4] 1,900	[4] 1,976
Bolivia (exports)	Cobalt ore			2	2	28	189
Burma	Cobaltiferous nickel speiss	[5] 238	[5] 229	2 8	73	(2)	(3)
Canada	Cobalt ores, oxide, and metal	208	332	360	119	38	77
Morocco, French	Cobalt ore	720	719	700	700	400	(2)

United States	Cobalt ore			(6)	(6)	(6)	(6)

[1] In addition to countries listed Brazil, Chile, China, Finland, Germany, Italy, Japan, and Mexico produce cobalt, but production data are not available.
[2] Data not available.
[3] Less than 1 ton.
[4] Imports into United States.
[5] Year ended June 30 of year stated.
[6] Bureau of Mines not at liberty to publish figures.

Belgian Congo.—Belgian Congo continues to be the world's chief source of cobalt. Cobalt is mined as such and as a high-grade copper-cobalt ore. It also occurs with sulfide and carbonate copper ores, from both of which partial recovery is made by concentration. To keep its installations up to date and to increase production, the Union Minière du Haut Katanga resumed operations at the mine and cobalt-concentrating plant of Kabolela and installed two new electric furnaces and a cobalt-recovery plant at Jadotville. It was opening and equipping a new cobalt mine and ore-treatment plant at Kamoto and erecting a plant at Jadotville for the production of electrolytic cobalt. Production data for Belgian Congo have not been published since 1938. when

1,532 metric tons were produced. However, since the invasion of Belgium, where Belgian Congo alloy formerly was processed, the entire output has been shipped to the United States, and during the 4 years 1940–43 imports have averaged 1,786 metric tons, indicating that production has increased since 1938.

French Morocco.—French Morocco is an important producer of cobalt, and during the time it was occupied by Germany probably the bulk of Germany's supply was obtained from that source. The cobalt production of French Morocco has been allocated to the United States by the Combined Raw Materials Board, and in 1943 imports from that country amounted to 4,437 short tons of ore containing 1,098,228 pounds of cobalt.

According to Brooks:[2]

> Cobalt deposits of the Protectorate are exploited by the most modern mining methods. They are found in pre-Cambrian strata which form the substructure of the Anti-Atlas Mountains. The pre-Cambrian crops out in a certain number of eruptions, of which the best known is that of Bou-Azzer, East of Tazanakht. It is a linear discontinuous cropping out running towards the South-East with a maximum of 60 kilometers in length and of 8 kilometers in width. The component rocks are sedimentary or eruptive and the ore resembles smaltine (gray cobalt), skutterudite or safflorite, which make up the crystalline aggregates at Bou-Azzer. But these aggregates consist of rather complex disparate elements. Waters flowing along the veins are light solutions of cobalt and nickel and contain arsenate of iron. Virgin gold is also found in the veins attached to the cobalt ore or, at times, concentrated in very fine clay. The gold content varies from 5 to 30 grams per ton. Average cobalt content of commercial ore is 11 to 12 percent, although there are other commercial-grade ores with a cobalt content as low as 0.75 to 1.25 percent. The mines of Bou-Azzer and of Graara are very well equipped, are in full operation, and contribute to the supplying of industrial requirements of Allied countries.

Northern Rhodesia.—Northern Rhodesia is second to Belgian Congo as a producer of cobalt. The production of cobalt in Northern Rhodesia has been described by the South African Mining and Engineering Journal,[3] from which the following is quoted:

> Cobalt occurs associated with copper in certain of the ore found in the copper mines of Northern Rhodesia. At the Nkana mine of the Rhokana Corporation, the copper-bearing minerals in the ore are mainly bornite, chalcopyrite, chalcocite, and carrollite. Copper occurs almost entirely as sulfides, less than 1 percent of the total copper appearing as oxidised forms, mainly malachite and cuprite, with a little native copper. The principal cobalt mineral is carrollite, but about 5 percent of the total cobalt in the ore occurs in the oxidised form asbolite. The percentage of cobalt in the ore varies considerably from nil to as high as 0.6 to 0.9, but the average percentage of cobalt in the ore treated in the Nkana plant is in the region of 0.15. Since the copper minerals at the Nkana mine are almost entirely sulfides, concentration by flotation would be quite simple were it not for the presence of cobalt. The recovery of cobalt necessitates making two concentrates—one high in copper and low in cobalt, and one low in copper and high in cobalt. * * * The two concentrates are treated separately in the reverberatory furnaces. * * * In the reverberatory furnaces a sulfide matte containing principally copper, iron, cobalt, and sulfur is formed in the bottom of the furnace, while a slag layer, consisting mainly of silicates, is formed on the top of the matte. The two products can thus be tapped off separately, the slag going to waste and the matte to the converters. * * * The presence of cobalt introduces a complication in the converter practice. Cobalt oxidises before copper, so that an impure cobalt oxide can be removed as a silicate in the slag. This slag, in practice, is a mixture of cobalt, iron, and copper, present as oxides, sulfides, and silicates, together with silicates of aluminum, calcium, and magnesium.

---

[2] Brooks, R. M., American Consul, Casablanca, Morocco, May 12, 1943.

[3] South African Mining and Engineering Journal, Production of Cobalt—Process Adopted at Nkana Mine: Vol. 54, part I, No. 2635, July 31, 1943, pp. 465, 467.

Silica is added to the converter to form a fluid slag. The slag formed from the cobalt-rich concentrate is granulated and sent to the electromelt furnace. Coke is added to the slag containing cobalt, iron, and copper. An alloy containing copper, iron, and cobalt is then formed, and an electric furnace slag is also produced. The alloy is then granulated and is ready for shipment to the refinery for the recovery of cobalt. The slag is disposed of as waste. From an alloy of the above type, it is possible to produce ferrocobalt and pure cobalt by electrolytic deposition. * * * The production of pure cobalt from alloy is more difficult than the production of ferrocobalt, because of difficulties encountered in the iron purification step. * * * The above process can be used for the production of pure cobalt metal, ferrocobalt, cobalt oxide, and cobalt sulfate.

U. S. S. R.—According to Dudavsky:[4]

Before the war, the output of this metal (cobalt), so vital to the war industry, was inconsiderable, and supplies were almost entirely controlled by our Allies. In the U. S. S. R., too, extraction was not large. A small quantity was obtained by hydrometallurgical methods from cobalt ores and byproducts of copper smelting. A few years before the war, however, considerable quantities were found in the nickel ores of the Kazakhstan and Murmansk regions. Deposits were discovered of cobalt, manganese-cobalt, and arseno-cobalt ores. Among the Urals' resources were deposits of copper-pyrites, copper-nickel, and silicate-nickel ores, which contained cobalt. Though their existence and their location had been known for over a century, their exploitation was never attempted. Their complex character, the low percentage of cobalt they contained, demanded too elaborate a process of extraction: very costly appliances were required, and this made the whole process unprofitable from an economic standpoint. But the problem of obtaining cobalt acquired increasing importance for the Soviet war industry. * * * But if cobalt was to be obtained on a large industrial scale from the Urals' ores, it was necessary to work out a new and efficient technology for the dressing and separation of complex ores. Experiments were carried out on a big scale at one of the dressing plants in the Urals. These were preceded by numerous laboratory experiments. Soviet scientists solved the problem of dressing and separating cobalt ores into their compound minerals. The opening of the cobalt mines in the Urals was speeded up. Now they are fulfilling their production program. The dressing plants keep pace with output.

SUMMARY

"Moly" stood in an eminently satisfactory statistical position at the end of 1943, as a result of producers' exertions, wartime controls, and versatility of molybdenum among the important alloying elements. The war-stimulated demand for molybdenum (augmented by its substitution in part for tungsten), which boosted consumption of concentrates to over 28,000 short tons of contained molybdenum in 1942, continued during the first 5 months of 1943. Despite the all-out efforts of domestic producers to pace requirements, inventories of concentrates dwindled at an alarming rate. The turning point came in the late spring of 1943, when consumption dropped sharply and stocks began to rise. The tight situation was eased largely through reduction in the armament program, with attendant reduction in output of alloy steels, conservation of molybdenum through increased use of the NE steels containing 0.25 percent or less Mo, and greater employment of scrap.

A new high in mine production was established, both for a year and for a single month. The 8-percent increase over the 1942 total was accompanied by a million-pounds (Mo content), or 138-percent, rise in imports, largely for Government stock-piling, as Western Hemisphere countries responded to the needs of the United Nations. On the other hand, internal consumption dropped 11 percent, and exports—virtually all Lend-Lease—receded 9 percent compared with those of the preceding year. The net effect was to increase total domestic stocks roughly 50 percent to the equivalent of 6 months' requirements at the average use rate of the last quarter of 1943. Details for the period July 1941 to December 1943 are given in a subsequent table.

Salient statistics of the molybdenum industry in the United States, 1939–43, in thousands of pounds of molybdenum contained in concentrates

	1939	1940	1941	1942	1943
Production	30,324	34,313	40,162	[1] 56,918	61,406
Imports for consumption [2]	26		4	756	1,789
Shipments (including exports)	32,415	25,329	38,200	66,437	53,706
Consumption	(3)	(3)	[4] 16,891	56,388	49,891
Stocks (industry) December 31	(3)	(3)	21,200	12,491	[5] 17,750

[1] Revised.

[2] Molydenum content of molydenum products (1939) and of ores and concentrates (1941–43).

[3] Data not available.

[4] 6 months, July to December.

[5] Government stocks at the end of 1943 contained 2,167,273 pounds of molybdenum.

POST-WAR OUTLOOK

Since the United States has exported more molybdenum than it has consumed, except in the war years, the future trend in use will be determined by foreign purchasing power. The potential demand, principally for structural and engineering steel for reconstruction and rehabilitation, will be very great, but much of the material needed may be derived from battlefield scrap and surplus war matériel, both at home and abroad. An orderly and relatively long-term disposal of such material probably would not bring about a serious market contraction. A counterbalancing factor will be further industrialization in the U. S. S. R., heretofore a substantial consumer. Japan was also a large molybdenum buyer, but its smaller future requirements will be at least partly offset by China's needs. In this country, steel output probably will be higher than the pre-war average, with a tendency for alloy steels to be an increasingly larger component. Although there is a strong likelihood that some of the war-created low-alloy steels will find continuing application, the use of molybdenum will not be greatly affected, as it is a constituent of virtually all that are expected to persist. In general, the consumption of new supplies of molybdenum may be expected to rise in the post-war period but at a rate considerably below that in evidence in the 1930's.

WAR REGULATIONS

In April 1943 amended General Preference Order M-21-h, requiring that 75 percent of all high-speed steel orders accepted in any one quarter be of the molybdenum type and not more than 25 percent of the tungsten type, was modified to permit a leeway of 5 percent by weight, or within 500 pounds, in meeting the required ratio. Receipts of 100 pounds or less of high-speed steel are exempt from provisions of the order. Further amendment on May 12 raised the permitted ratio of tungsten-type high-speed steels to 35 percent, thereby decreasing the molybdenum requirement. Supplementary Order M-110-a, as amended (October 2), authorized the acquisition of 500 pounds or less of molybdenum by foundries to fill certain high-preference orders without going through allocation proceedings. Molybdenum was removed completely from allocation on December 30 by the issuance of General Preference Order M-110-a. However, vendors of more than 2,000 pounds of molybdenum in any 1 month were required to report all sales to the War Production Board. Molybdenum ingot, wire, and sheets continued on allocation (General Preference Order M-369, December 31).

Price-control regulations are given in the section on Prices.

PRICES

The First World War period, 1914-18, marked the beginning of consistent molybdenum-ore domestic production. The United States quickly became the world's premier supplier in response to strong foreign demand. The highest prices known were those of 1917, when the average sales price was about $4.50 per pound molybdenum contained in ferromolybdenum (60 to 70 percent Mo), and MoS_2 averaged $2.10 a pound in 90-percent MoS_2 concentrate. The rapid development of the tremendous Climax deposit from 1918 on and the relatively slow acceptance of the metal for alloying purposes precipitated a downward movement in ferro price that continued uninterruptedly through 1931. In February 1932 a final drop of 5 cents brought the price to 95 cents a pound; it remained at this level until frozen and subsequently became a specific ceiling under the provisions of M. P. R. 489, effective November 8, 1943. Price-control history and general provisions of M. P. R. 489, given in the chapter on Vanadium, apply also to molybdenum. The specific maximum prices for the principal products, per pound contained Mo, follow:

Ferromolybdenum	$0.95
Molybdic oxide, technical (powder or briquets)	.80
Calcium molybdate	.80

The maximum prices for other molybdenum products (molybdenum metal powder, molybdenum carbide powder, molybdic acid, molybdenum trioxide, molybdenum silicide, sodium molybdate, ammonium molybdate, other molybdenum alloys, and compounds consumed principally by the metallurgical industry) were to be the highest prices charged or quoted for such products by a seller on a delivery made during January, February, or March 1942 to a purchaser of the same class.

No ceiling price was fixed for ores and concentrates. The nominal price, however, of 45 cents a pound MoS_2 in the standard 90 percent MoS_2 concentrate that has prevailed since 1938, continues to be quoted.

UNITED STATES

PRODUCTION

Despite a labor shortage at Climax and curtailed operation at the end of the year, 1942 domestic output was topped by 8 percent to reach a new peak of 61,406,000 pounds of molybdenum in concentrates. Since 1918 the Climax Molybdenum Co. has maintained its leadership in domestic production. Its share, however, has declined somewhat since byproduct recovery from copper mines began in 1936. In 1943 Climax also set an all-time production record of over 46 million pounds contained molybdenum in concentrates and supplied 75 percent of the United States production. Of the remainder, 22 percent was furnished by copper mines and 3 percent by others.

Domestic shipments from 1914 to 1943, inclusive, are shown in the accompanying table. The pattern of the 19-percent decline in 1943 shipments is traced by months in the summary table in the section on Consumption and Uses.

Molybdenum in ore and concentrates shipped from mines in the United States, 1914–43 [1]

Year	Pounds	Value [2]	Year	Pounds	Value [2]
1914–18	1,601,643	$2,070,213	1939	32,415,000	$22,157,000
1919–23 [3]	355,493	370,371	1940	25,329,000	17,189,000
1924–28	8,498,343	6,160,304	1941	38,200,000	25,883,000
1929–33	18,954,917	11,406,000	1942	66,437,000	[4] 47,275,000
1934–38	94,077,000	64,244,000	1943	53,706,000	38,346,000

[1] For shipments by years, 1914–38, see chapter of this series for 1941.
[2] Largely estimated by Bureau of Mines.
[3] No shipments in 1920 and 1921.
[4] Revised figure.

To stimulate domestic production and provide a ready market for molybdenite concentrates, the War Production Board recommended that the Metals Reserve Co. institute a small-lot purchasing program. On July 8, 1943, a buying schedule was announced. Since it was desired to develop new operations, it was provided that no concentrates were acceptable from a producer whose monthly output during the first 6 months of 1943 averaged more than 24,000 pounds of contained molybdenite, except by special arrangement. This automatically eliminated the seven regular producers of molybdenum ores and concentrates. Metals Reserve Co. offered 37 cents per pound of contained MoS_2 in concentrates (delivered at its purchasing depots) that would meet the following specifications: MoS_2—minimum 80 percent; copper—maximum 0.5 percent; lead—maximum 0.3 percent; phosphorus—maximum 0.1 percent. The maximum copper content acceptable was 1.0 percent, but penalties of 1 cent per pound of contained MoS_2 were to be imposed if the copper content was above 0.5 percent up to and including 0.8 percent; and 2 cents per pound if above 0.8 percent up to and including 1.0 percent. No purchases were made during the year.

REVIEW BY STATES

Arizona.—Two producers of molybdenum concentrates were active in 1943. Miami Copper Co. continued the recovery of molybdenite from copper operations at Miami and produced and shipped molybdenum oxide. The molybdenum recovered by Mammoth-St. Anthony, Ltd., from complex ore at Tiger, Ariz., was marketed as calcium molybdate.

Bagdad Copper Corporation installed an experimental unit for the recovery of molybdenite from copper ore mined near Hillside, Yavapai County. Production was expected to begin early in 1944.

Colorado.—Despite labor shortages and curtailment of operations at the end of the year, molybdenum production by Climax Molybdenum Co. in 1943 rose to 45,489 short tons of concentrates, containing 46,133,715 pounds of molybdenum, exceeding the record of the previous year by 10 percent and bringing the total output from 1918–43 to over 268,000,000 pounds of contained molybdenum. In September 1942 this company was awarded an Army-Navy E pennant for excellence in production. A renewal of the award was made in April 1943. The importance placed on maintenance of production from the world-famous Climax deposit was indicated in the spring of 1943, when the Climax Co. was listed first in the War Manpower Commission list of labor priorities for nonferrous metal mines.

The construction of an additional mill unit was completed and put into operation in 1942. The capacity of the drying and regrind plants was increased, and a 125-foot thickener was installed. This new construction raised the daily milling and treating capacity of the plant to 18,000 to 20,000 tons of ore. The plant operated throughout 1943 at the average daily rate of 17,600 tons.

At Langeloth, Pa., Climax Molybdenum Co. converts a large part of its production of concentrates to molybdenum oxide, molybdic oxide briquets, ferromolybdenum, calcium molybdate, and other industrial products.

The Molybdenum Corporation of America reacquired the Urad mine about 10 miles west of Empire in Clear Creek County [1] from the

---

[1] Minerals Yearbook, 1942, p. 661.

Metals Reserve Co. An 1,150-foot raise, 8 by 19 feet in cross section, was completed in the very short time of 8 months. It starts about half a mile from the portal of an old adit, which is at an elevation of 10,500 feet above sea level, and connects with old workings that were several hundred feet deep. Because of labor shortage, only development is now under way. A mill with a crushing section for 1,000 tons per day and a 200-ton flotation unit was erected. In the spring of 1944 about 90 tons of ore from development were being milled daily. The company also purchased 400 acres of adjacent mineral land. It was reported that developments were proving satisfactory.

Nevada.—It has been reported that molybdenite has been found over a wide area in drilling below shallow workings of the old Fifty-Six mine near Imlay, Pershing County.

New Mexico.—Production of molybdenite concentrates at the Questa mine of the Molybdenum Corporation of America continued at an increased rate. A brief description of the property and historical record of production from 1919 to 1942, inclusive, appeared in the Molybdenum chapter of Minerals Yearbook, 1942 (pp. 659-660). Byproduct recovery of molybdenum at the Chino property of Kennecott Copper Corporation, which began in 1937, was also continued throughout 1943.

Utah.—Second only to Climax Molybdenum Co. is the molybdenum operation of Utah Copper Co. Molybdenum concentrates have been recovered since 1936 as a byproduct of copper operations, and in 1943 production reached the highest level so far recorded.

Washington.—Several hundred tons of low-grade ore were mined from the property of Consolidated Mines & Smelting Co., Ltd., in Ferry County near Keller, but none was treated or shipped.

EXPLORATION AND DEVELOPMENT

The Bureau of Mines and Geological Survey continued their investigational and exploratory programs individually and cooperatively during 1943.

In Alaska the Bureau announced plans for developing molybdenum properties in the Virginia Lake district and on the Ohog River, 30 miles from Aniak. The Geological Survey examined a molybdenite deposit on the east coast of Baker Island, one of the large islands off the west coast of Prince of Wales Island, and prepared a preliminary map of the deposit. The Shakan deposit, Kosciusko Island, southeastern Alaska, was also examined and mapped. Findings were summarized as follows: [2]

> The molybdenite deposits near Shakan, Kosciusko Island, southeastern Alaska, are in a narrow-low-dipping fault zone in hornblende diorite. * * * Surface and underground workings expose one ore shoot which probably contains between 10,000 and 20,000 tons of measured and indicated ore containing about 1.5 percent MoS_2. A few tens of thousands of tons of additional ore may be inferred in extensions of the known ore shoot and in shoots not now exposed.

In Arizona the two agencies examined and sampled the Amargosa molybdenum-copper mine, Pima County, and the Copper Hill and Loma Prieta properties in the Copper Basin mining district of Yavapai County. Assays and concentration tests were made by the Bureau of Mines on samples from the Amargosa mine and from the

Leviathan property in Mohave County, which was reported to have been a notable producer during the First World War. Examinations were made by both agencies on molybdenum deposits in Custer County, Idaho, near Neihart, Cascade County, Mont., in the Tonopah (Nev.) district, and in Okanogan County, Wash. The Bureau also examined the Kromona mine, 25 miles northeast of Sultan, Snohomish County, Wash., and conducted exploratory work at the old Liberty mine, a former silver-lead producer, north of Tonopah, Nev. As the work performed failed to disclose ore of sufficiently high grade, the project was discontinued on November 15. In addition to many brief examinations of reported molybdenum occurrences the Geological Survey made investigations in the vicinity of Pine Creek, Inyo County, Calif., and of molybdenite prospects about 5 miles east of Hollister, N. C. Preliminary geologic maps of the North Carolina properties were released.

CONSUMPTION AND USES

Used only experimentally in the production of war matériel—principally armor plate—in this country near the end of the first world conflict, molybdenum is now considered one of the most important alloy metals. Among its properties, molybdenum imparts high creep resistance and depth hardness to steels. It makes possible high working temperatures, to acquire toughness without sacrifice of hardness and without development of brittleness on cooling. It thus finds a wide range of usefulness, from the so-called straight molybdenum type to the multiple low-alloy National Emergency series steels. In cast irons it increases tensile strength, wear, and impact resistance, with little or no effect on machinability. Another important characteristic is its substitutability to a considerable extent for other alloying elements especially tungsten. More than 95 percent of consumption is in steels, mostly in the form of molybdenum oxide, ferromolybdenum, and calcium molybdate; about 3 percent is in cast iron; and limited employment is found in the chemical and ceramic industries. The pure metal is used in negligible quantity but is of highly strategic importance in radio and radar equipment.

Owing to its great utility, molybdenum had been classified as a strategic mineral before the present war broke out; however, even after the United States became a participant, domestic productive capacity appeared ample to meet our needs for war and essential civilian requirements. By midsummer 1942 alloy-steel output had increased greatly (about 35 percent over the January production), as had the Allied demand. Molybdenum was then classified by the War Production Board as insufficient for war needs alone, and a few weeks later—in the latter part of August—was placed in the most critical group of that class. Further growth in alloy-steel output, enhanced by the tungsten shortage, brought about a sharp decline in industry stocks, so that 1943 opened with about half the supply of concentrates available at the beginning of 1942. Notwithstanding the stringent allocation controls, the high rate of consumption that first exceeded 5 million pounds monthly in June 1942 continued through May 1943. At the end of that month, industry stocks reached the lowest point recorded since the Bureau of Mines undertook monthly industry surveys in July 1941. At this dangerously low level, total industry stocks barely exceeded 8 million pounds, with those of producers under 3,500,000 pounds, or roughly only 3 weeks' supply at the then current rate of use. Subsequent shifts and cut-backs in military requirements rapidly reduced the consumption rate to little more than 2 million pounds in December, a figure below the average for the latter half of 1941 and less than 39 percent of the peak recorded in January 1943.

The combination of the severely reduced demand and large mine output speedily improved the supply position so that in October 1943 molybdenum was reclassified as again available for all essential needs.

The situation with respect to molybdenum products was relatively static from July 1941 through March 1943, with industry stocks held close to the 9 million pounds (molybdenum content) considered the minimum safe working level. Henceforward slight accretions were permitted as the raw-material position was bettered, and the year ended with 12 million pounds in consumers' and producers' hands, or essentially the excess of production over consumption in the 2 years 1942–43. The industry advisory committee to the War Production Board recommended a minimum stock pile of 24,000,000 pounds Mo in usable form in October 1943. This objective had been reached about the end of August. At the year end industry stocks of concentrates and molybdenum products were nearly 30,000,000 pounds (Mo content). In addition, Government holdings exceeded 2 million pounds. With an expected continuation of exports at the low rate prevailing in the last quarter of 1943, the War Production Board estimated the 1944 requirements, including Lend-Lease, to be slightly over 11 million pounds (Mo content in usable form) each quarter or 44,561,000 pounds for the year. Total available supply at the beginning of 1944 was therefore equivalent to about 8 months' over-all needs.

The status of domestic molybdenum concentrate production, consumption, and stocks and the consumption of molybdenum products since July 1, 1941, are shown in the accompanying tables.

United States production, shipments, consumption, and stocks of molybdenum concentrates,[1] July 1941 to December 1943, inclusive, in thousands of pounds of contained metal

Period	Production	Shipments—		Consumption	Stocks at end of period	
		To domestic consumers	For export		Producers'	Consumers'
1941: July-December	22,477	17,720	5,838	16,891	17,348	3,852
1942: January-December	[2] 56,918	58,001	8.436	56,388	7,808	4,683

[1] 1942–44, includes molybdenum trioxide and molybdic acid.

[2] Ammonium molybdate, sodium molybdate, molybdenum silicide, molybdenum metal, and alloys (molybdenum trioxide and molybdic acid in 1941).

FOREIGN TRADE [3]

Ordinarily imports of molybdenum ores and concentrates are insignificant. The sharp rise in 1943 to 1,788,652 pounds (contained molybdenum) was due largely to the marked increase in receipts from Chile. Imports of Canadian concentrates, which began in the fourth quarter of 1943, were for treatment and return to the Dominion.

Export statistics have been available only since 1939. During the war period about 20 percent of domestic shipments has been exported; in previous years the percentage was estimated at 50 to 75. Imports and exports of molybdenum in recent years appear in the accompanying tables.

Molybdenum ore and concentrates imported for consumption in the United States, 1942–43, by countries

Country	1942			1943		
	Pounds		Value	Pounds		Value
	Gross weight	Molybdenum content		Gross weight	Molybdenum content

WORLD PRODUCTION AND DEVELOPMENTS

Examinations of molybdenum deposits in Latin American countries were made by geologists of the Federal Geological Survey in Colombia and El Salvador, under the auspices of the Foreign Economic Administration, and in Lower California and Sonora, Mexico, under the auspices of the United States Department of State.

Canada.[4]—The feverish search for molybdenum deposits in Canada in 1942 apparently subsided. In 1943, although a certain amount of exploration and development continued, output came principally from three producers in Quebec—Indian Molybdenite property in Preissac Township, the La Corne Molybdenum project[5] (sponsored by Wartime Metals Corporation under the management of Siscoe Gold Mines), and the Quyon Molybdenite Co. at Quyon. Milling operations at the Indian Molybdenite property began late in September, and by the end of the year ore was being treated at the rate of 350 tons per day; production during the year was 22,739 tons of ore. A 50-ton mill was erected on the property of Vic-Ore Molybdenite Mines, Ltd., 38 miles north of Ottawa, and the first shipment of concentrates was made in November 1943.

Canadian self-sufficiency in molybdenite was claimed in 1943, and during the last 3 months of the year substantial shipments were made to the United States for treatment and return to the Dominion. However, production is expected to cease early in 1944, as the Canadian Government canceled its contract with Indian Molybdenum, Ltd., as of April 30, 1944.

Chile.—Molybdenum concentrate output obtained as a byproduct from copper operations by the Braden Copper Co. was contracted for by Metals Reserve Co.

Macedonia.—According to the Bulgarische Wochenschau,[6] one-tenth of the population (14,000 people) is employed in mining chromite, lead, zinc, and molybdenum. About 9,000 persons are said to be working in molybdenum mines, and output is claimed to be the highest in Europe and the fourth highest in the world.

---

[4] Occurrences and milling of Canadian molybdenite are described by: Claudet, H. H., Molybdenite in Canada: Canadian Inst. Min. and Met. Bull. 383, March 1944, pp. 87–98.

[5] Norman, G. W. H., Molybdenite Deposits and Pegmatites in the Preissac-La Corne Area, Abitibi County, Quebec (abst): Econ. Geol., vol. 39, No. 1, February 1944, p. 100.

[6] Iron and Coal Trades Review, No. 3956, December 24, 1943, p. 1000.

Manchuria.—Further indication of molybdenum production in Manchuria (see Minerals Yearbook, 1942, p. 664) is contained in the announcement by the president of the Manchurian Industrial Development Corporation[7] that production of molybdenum in the second quarter of 1943 was 100.5 percent of that in the corresponding period of 1942; steel was 151.5, pig iron 111, coal 107, lead 134.6, and zinc 258.9; 1942 was the first full year of the 4-year plan now in effect.

Mexico.—Import duties on molybdenum entering the United States from Mexico were reduced 50 percent under terms of a trade agreement between the two countries signed December 23, 1942, and effective January 30, 1943. The agreement is for 3 years, with automatic extension to 6 months after expiration unless either party notifies the other of intention to terminate. All receipts are for the account of Metals Reserve Co.

Norway.—The Knaben mines in Norway are the largest source of molybdenum in Europe, and for many years Norway was the second-largest producing country. Being one of the few sources of molybdenum available to the Axis, production has undoubtedly been pushed to the limit during World War II. In 1943, however, these efforts were thwarted by bombing of the Knaben mines by the R. A. F. in March, when three-fourths of the German supply is believed to have been knocked out, and again in November, when a further attack by British-based American heavy bombers severely reduced Norway's ferro-alloy output as well as that of light metals.

World production of molybdenum in ores and concentrates, 1938–43, by countries, in metric tons

SUMMARY

In 1943 the production of vanadium-bearing ores reached an all-time high, culminating an upward trend that started from virtually zero in the depression year 1933. The industry was stimulated by the improved business conditions of 1937 and received further impetus from the outbreak of war in Europe, particularly after the entrance of the United States into the conflict. The 1943 production peak was more than five times that of 1917, when the vanadium content of mined production first reached a million pounds, and represented about 60 percent of the estimated world production.

Although vanadium contained in ores imported in 1943 was about 370,000 pounds (15 percent) less than in 1942, the available new supply mounted about 10 percent. Consumption of domestic and foreign ores was relatively unchanged. Stocks of vanadium in all forms increased so satisfactorily that allocation controls were removed by the War Production Board on December 30, and about a month later the Metals Reserve Co. announced termination of the Government ore-buying program.

Salient statistics of the vanadium industry in the United States, 1940–43, in pounds of vanadium contained

	1940	1941	1942	1943
Mine shipments of ores and concentrates [1]	2,162,916	2,513,051	4,439,130	5,586,492
Imports:				
Ore or concentrates	2,574,951	2,138,608	2,422,376	2,052,620
Vanadium-bearing flue dust	([2])	([2])	154,028	64,393
Exports of ore, concentrates, and vanadium oxide	([2])	25,462	22,140	38,180
Consumption [3]	2,162,916	2,393,478	3,914,673	5,179,290

[1] Measured by receipts at mills and Government purchasing depots.
[2] Data not available.
[3] Domestic ores only.

POST-WAR OUTLOOK

The post-war course of vanadium consumption will be related closely to the demand for engineering steels. In peacetimes, use is highly concentrated within a few industry groups. Wartime expansion in the heavy-duty machinery field has resulted in an accumulation of much equipment that may be utilized for peacetime production.

Probably the greatest normal use for vanadium is for cutting and high-speed tools. The peacetime volume of these goods was increased severalfold by total-war demands. The automotive and railway-equipment industries represent the remaining large consumption areas. Here there is a great potential market. However, scrap and surplus armament will afford a prolific source of secondary metal. The resultant of these various depressants on the use of new supplies points toward a short-term decline below the immediate pre-war consumption level while overhanging surpluses of basic vanadium products and fabricated or partly fabricated goods are being consumed. Beyond that time an expansion of use is anticipated.

WAR REGULATIONS

War Production Board allocation control of vanadium, which had been in effect since December 20, 1941, was lifted on December 30, 1943, by amendment to General Preference Order M-23-a. However, vendors of more than 500 pounds of vanadium (ferrovanadium and commercial vanadium pentoxide) in any one month were required henceforth to report all sales to the War Production Board. Under General Imports Order M-63 the Government had complete control over vanadium imports.

The restrictions imposed by W. P. B. order M-21-h on the use of vanadium in melting alloy tool steels were removed in January 1944, thereby allowing producers of alloy steels to use any alloy content desired, except that they were required to employ 50- to 60-percent alloy scrap in all melts. Revocation of General Limitation Order L-223, early in January 1944, removed W. P. B. restrictions on the distribution, sale, and use of hard-facing alloys containing vanadium and certain other metals.

Price-control regulations are given in the section on Prices.

Sales of vanadium for laboratory and experimental purposes are exempt from the provisions of the regulation, as is the importation of processed materials. However, their resale is subject to the same maximum prices as domestically produced materials.

Because of the vertical integration of the industry and virtually complete concentration of ferrovanadium production in the hands of two companies, the Office of Price Administration believed price control could be achieved most fully at that stage of production. Therefore, ores and concentrates, both foreign and domestic, have been specifically exempted from these provisions of the regulation.

This regulation incorporated without change the standards and specifications that have been used by industry.

PRICES

More than 80 percent of vanadium consumption is in the form of ferrovanadium. From the beginning of production in this country (about 1907) to the outbreak of the First World War, ferrovanadium prices were irregular but substantially below the high average of 1919-21 of above $4.50 per pound of contained vanadium. Prices dropped abruptly about $1.00 in 1922 and declined gradually thereafter to $2.60-$2.80 for the usual commercial grades at the end of 1932. In 1933, prices recovered to $2.70-$2.90 and remained stable thereat until the autumn of 1941, when the producers agreed informally with the Office of Price Administration not to increase the prices without notice to that agency. This arrangement was succeeded by the General Maximum Price Regulation of April 28, 1942, which froze prices at the levels then existing. These ceiling prices in turn became fixed specifically, under the terms of Maximum Price Regulation 489, effective November 8, 1943, which also set prices on tungsten, molybdenum, cobalt, and certain other alloys and metals.

Following are the established maximum prices per pound of contained vanadium in *ferrovanadium*, for standard crushed sizes, f. o. b. Niagara Falls, N. Y., or Bridgeville, Pa., freight allowed to destination for 25 pounds or over:

Grade	Analysis			Prices	
	Percent V (minimum)	Percent Si (maximum)	Percent C (maximum)	Contract	Spot
A—Open Hearth	30	12.00	3.50	$2.70	$2.80
B—Crucible	35	4.00	1.00	2.80	2.90
C—Primos	35	1.50	.20	2.90	3.00

Premiums per pound of contained vanadium for crushing or grinding to sizes smaller than the standard may be added.

Maximum prices per pound of contained V_2O_5 in vanadium pentoxide, for air-dried or fused vanadium pentoxide, f. o. b. Niagara Falls, N. Y., or Bridgeville, Pa., with freight allowed to destination on 25 pounds or over, were established at:

(1) Maximum base contract price, any quantity	$1.10
(2) Maximum base spot price:	
500 pounds and over	1.15
Less than 500 pounds to 10 pounds	1.20
Under 10 pounds	1.25

Premiums per pound of V_2O_5 contained for crushing or grinding to sizes smaller than the standard may be added.

Maximum prices for other vanadium products (metal and metal powder, silicide, chloride, sodiumorthovanadate, ammonium metavanadate, and other vanadium alloys and compounds consumed principally by the metallurgical industry) are the highest prices charged or quoted for such products during January, February, or March 1942 to a purchaser of the same class.

An upward trend in prices paid for vanadium ores was noted in the Minerals Yearbook review of 1942. The average reported for 1943 showed a further advance of 4 cents to about 35 cents per pound of contained vanadium pentoxide. This was largely the effect of a full year's buying program, a substantial share of which was for Government account (Metals Reserve Co.), at somewhat above the earlier free market prices. Trade-journal quotations are nominal and have been listed at 27½ cents since 1935. However, private buyers have purchased upon a sliding-scale basis that depended principally upon the V_2O_5 content with a minimum close to 2 percent. Before the United States entered the present conflict, prices (delivered buyers' works) reported to the Bureau of Mines ranged from about 18 to 35 cents and more for the various standard grades and classes. The bulk of purchases was between 18 and 25 cents. No consideration is here given to content of uranium, which has a limited market and is frequently too low to be commercially recoverable. In 1942–43, in order to stimulate production, especially by small operators, the Metals Reserve Co. not only purchased ores normally unacceptable because of low grade or refractory nature but set prices virtually on a single-lot basis, giving consideration to the higher labor and supply costs and to the length of haul to purchase depots or processing plants. No fixed purchasing schedule was effective, but from incomplete reports to the Bureau delivered prices appear to have been approximately 50 to 75 percent above the pre-war levels.

UNITED STATES

MINE PRODUCTION AND TREATMENT OF ORES

The 1943 record-breaking mine output of vanadium ores and concentrates containing 9,975,878 pounds of V_2O_5 (5,586,492 pounds of V) was in great measure attributable to the policies made effective by the Metals Reserve Co. Its agents, the United States Vanadium Corporation and the Vanadium Corporation of America, through their long experience and skill in mining, ore purchasing, and processing, contributed greatly to the success of the intensive production program.

The principal policy invoked was that of price incentive (see section on Prices), to which the response was marked. Until Metals Reserve Co. entered the ore-purchasing field in 1942, mine output was heavily concentrated in the hands of a small group of operators and their lessees. With increased prices offered at the mine and concurrent relaxation of the usual minimum quantity and grade requirements, the number of what may be termed "independent" or small operators recorded by the Bureau of Mines for 1943 rose to 216. The number of like respondents rarely exceeded 20 in the past. The small-mine group furnished slightly more than half the Government-account purchases of over 4,300,000 pounds V_2O_5, and the remainder was supplied by 4 major operators. The distribution of small-lot production, by size of operation, is shown in the subjoined table.

Distribution of small-mine production (shipments), by size of operation, in pounds of vanadium pentoxide [1]

Pounds V_2O_5	Operators		Production		
	Number	Percent of total	Total pounds V_2O_5	Percent of total	Cumulative percent of total
Under 1,000	71	32.9	30,000	1.3	1.3
1,000-2,499	49	22.7	80,000	3.4	4.7
2,500-4,999	16	7.4	58,000	2.4	7.1
5,000-9,999	27	12.5	186,000	7.9	15.0
10,000-14,999	17	7.9	212,000	8.9	23.9
15,000-19,999	8	3.7	131,000	5.5	29.4
20,000-29,999	11	5.1	262,000	11.1	40.5
30,000-39,999	10	4.6	341,000	14.4	54.9
40,000-100,000	4	1.8	202,000	8.5	63.4
Over 100,000	3	1.4	865,000	36.6	100.0
Total	216	100.0	2,367,000	100.0	

[1] Includes about 158,000 pounds delivered to private mill operators.

This tabulation illustrates the size of individual deposits and indicates the need of systematic examination and exploration to provide reserves of carnotite and "roscoelite," the ore types that heretofore have been the source of nearly all domestic vanadium.

Although there was a considerable range in grade of ore—from 1.6 to 2.5 percent V_2O_5—for the different groups, there was no apparent correlation between size of operation and tenor. The average grade (1.8 percent V_2O_5) was slightly lower than that of ore shipped by the mill operators. The decline in grade of ore mined cannot be defined with precision from year to year, but over the long term it has been notable. In the First World War period—1915–19—it averaged about 30 pounds vanadium per short ton of ore (2.7 percent V_2O_5) compared with 20 pounds (1.8 percent) in the current war period, 1940–43.

As usual, Colorado led with 74 percent of the United States total production (vanadium content), followed by Utah with 15 percent and Arizona with 4; the remaining 7 percent originated in Idaho, Nevada, and New Mexico. In 1942, the distribution of vanadium production between ore types was: The so-called "roscoelites," 17 percent; carnotites, 77 percent; and others, 6 percent. In 1943 the percentages were 22.5, 74, and 3.5, respectively. Of interest was the expansion of mining in the Navajo Indian Reservation in northern Arizona and New Mexico. The principal independent Arizona producer was Wade, Curran & Co., which sent its ore to the Government treatment plant at Durango, Colo.

The following table shows total production by the major and smaller producers, by States. Owing to the difficulty of obtaining reports from all mine operators, some of whom are lessees from the major producers, mine production is here reported in terms of receipts at processing plants and purchasing depots.

Vanadium ores and concentrates produced in the United States in 1943, by States, in pounds of V_2O_5

State	Pounds	Value [1]
Arizona	404,054	$142,772
Colorado	7,428,267	2,610,207
Utah	1,488,715	523,117
Other [2]	654,842	242,397
	9,975,878	3,518,493

[1] Apportioned upon basis of estimated value of total production.
[2] Idaho, Nevada, and New Mexico.

At a meeting of the Vanadium Industry Advisory Committee of W. P. B. on October 25, 1943, it was stated[1] that restrictions on the use of vanadium might be eased. Production had exceeded consumption since the first of the year, and the stock-pile goal of 3 million pounds of ferrovanadium was in sight.

More specifically, allocations during the preceding 12 months had totaled 3,633,000 pounds (contained vanadium), and consumption was 3,550,000 pounds. At the end of August total stocks were 2,062,000 pounds, of which the Government held 948,000 pounds and industry 1,114,000 pounds. Consumers' average stocks for the preceding 6 months had been 415,000 pounds. Up to October 15 Metals Reserve Co. had received 2,562,776 pounds of ferrovanadium having a metal content of 1,153,386 pounds. In view of the satisfactory position, the committee recommended minimum stocks of 2 million pounds of vanadium in ferrovanadium or vanadium pentoxide, or about 6 months' supply at the estimated requirements for the first two quarters of 1944.

---

[1] Daily Metal Reporter, vol. 43, No. 231, December 4, 1943, p. 2.

A few days after the aforementioned meeting, the Production Executive Committee of W. P. B. announced its policy with respect to restricting marginal mineral production and related matters. The major factors that influenced the Board to take action were the increased mineral production, revised military requirements, and a greater need for marginal manpower than for marginal minerals. With respect to the alloying elements (vanadium, molybdenum, tungsten, cobalt, and others) the Board decided that when stock piles reached the recommended levels, production and imports would be kept in balance with consumption. To that end, arrangements were made to reduce Government purchases of certain ferro-alloy minerals. Further, no new contracts would be entered into for the purchase of foreign vanadium.

Since a material share of domestic vanadium production was of a marginal nature, as related in preceding paragraphs, domestic producers were forewarned of the subsequent action taken by Metals Reserve Co., which notified the industry that the Government-supported purchase program would be terminated February 29, 1944. After that date the processing plants at Durango, Gateway, and Monticello were closed down but kept in stand-by condition.

The treatment plants named below were in operation during 1943. The Blanding (Utah) plant, destroyed by fire in 1942 and rebuilt early in 1943, was operated for a short time only. Most of the owners' ore output was sold to Metals Reserve Co. Near the end of the year the Rifle plant treated some Metals Reserve Co. ore. At Durango a 100-ton acid-leach plant was put into operation to recover values from current and accumulated tailings. At Uravan, a new 250-ton unit began production late in July.

Location	Ownership	Operated by—	Capacity per day (short tons)
Colorado:			
Cedar	Private	No. Continent Mines, Inc	25
Durango	Defense Plant Corporation	U. S. V. Corporation (M. R. C. agent)	100
Gateway	Private	do	20
Grand Junction	do	U. S. V. Corporation	30
Naturita	do	Vanadium Corporation of America	75

Uravan	do	do	300
Utah:			
Blanding	do	Blanding Mines Co	25
Monticello	Defense Plant Corporation	Vanadium Corporation of America (M. R. C. agent).	100

In addition to the foregoing, the Anaconda Copper Mining Co. produced vanadium oxide at Anaconda, Mont., from phosphate rock mined in Idaho, and Mammoth-St. Anthony, Ltd., sodium vanadate from complex ores at its Tiger, Ariz., plant. Foreign ores and concentrates were treated at Bridgeville and Canonsburg, Pa., and vanadium was recovered as a byproduct at Glens Falls N. Y.

EXPLORATION AND DEVELOPMENT

In the Second World War period severe drafts have been made on our native resources. In terms of vanadium contained in ore mined, the output in the 4 years 1940–43 equaled that from 1918 through 1939 and was almost 42 percent of the total known historical (1900–1943) production of approximately 37 million pounds.[2] The unique American-owned Peruvian deposits have been materially depleted.[3] Other major world suppliers are South-West Africa and Northern Rhodesia. The former has not been able to show an enlarged output under the spur of war demand and partial State support. The latter remains the British Empire's principal source and cannot be expected to enlarge its current deliveries greatly, although reported to have large reserves.[4]

The properties imparted to iron and steel by vanadium additions give it high rank among the alloy elements. It is of general utility in low alloys and is considered an essential constituent of high-speed tool steels, high-strength cast irons, and steel forgings, and therefore has an important place in peacetime and a strategic one in wartime industrial production. The relative scarcity of commercially workable deposits, their concentration in a few hands, and their already indicated depletion brought about an intensive search for vanadiferous materials suitable at least as a secure emergency reserve. In the United States, by far the greatest consuming nation, these efforts appear to have been fruitful.

The potential vanadium reserves in the extensive phosphate beds of the Wyoming-Idaho area, which were disclosed as a result of studies begun by the Geological Survey in 1939, were explored further by the Bureau of Mines and the Survey, as well as by the Metals Reserve Co., operating through its agent—the Wyodak Coal & Manufacturing Co.[5] The results of field and laboratory work indicate that it may be possible to mine the raw material and recover both V_2O_5 and a phosphatic fertilizer at costs not widely divergent from those of current practice in this country. Elsewhere in Wyoming the Bureau of Mines investigated titaniferous magnetite deposits and crude oils as potential sources of vanadium.

Field studies of vanadium in sandstones of the Colorado Plateau, begun in 1939 by the Geological Survey in cooperation with the State of Colorado, were expanded in 1943 to include parts of Utah and the Carrizo Mountains in Arizona and New Mexico; preliminary geologic maps of the Placerville district, San Miguel County, Colo., were released. The drilling program of the Bureau of Mines approximated 40,000 feet on 40 different properties in southwestern Colorado and southeastern Utah. Ore-testing facilities of the Bureau were utilized in analyzing and treating specimens of vanadium-bearing materials from Arizona, Colorado, Nevada, Oregon, Utah, Washington, and Wyoming.

Exploration by diamond drilling was conducted by the Bureau on vanadium-bearing flake graphite ores in the Ashland district of Alabama, and laboratory tests were run to determine the economic possibilities of vanadium recovery from the material.

---

[2] Includes byproduct recovery from phosphate rock and complex Arizona ores.

[3] Minerals Yearbook, 1942, p. 671.

[4] See footnote 3.

[5] The principal vanadium-bearing layer in the phosphate measures has a reported V_2O_5 content of about 1 percent, which is about three times that of the high-grade phosphate rock mined by the Anaconda Copper Mining Co. and is apparently somewhat better than that of the large Peruvian asphaltite deposits.

Results of an earlier investigation by the Geological Survey of the vanadium-bearing magnetite deposits in northern New York were published.[6] The following statement has been abstracted therefrom.

> Four deposits of vanadium-bearing magnetite-ilmenite, closely associated with small intrusive bodies of gabbro in the anorthositic core of the Adirondack Mountains, have been found near Lake Sanford, Essex County, N. Y., at the head of the Hudson River.
>
> The ore consists of intermixed granular ilmenite and magnetite, with a little rutile and varying proportions of silicate minerals. The magnetic concentrate from the ore may contain * * * up to 1.7 percent V_2O_5 possibly in very fine-grained coulsonite, an iron-vanadium oxide, which is included in the magnetite. Three metals can be produced from the ore—iron and vanadium from the magnetite and titanium from the ilmenite.
>
> The largest of the deposits, on Sanford Hill, is now being mined by the National Lead Co. It has been proved by diamond drilling to contain, above the level of the lake, 11,500,000 tons of rich ore, which will yield 8,200,000 tons of magnetic concentrate containing, on the average, 0.6 percent V_2O_5.
>
> Another large deposit, on Iron Mountain, probably contains 7,000,000 tons of rich ore, which will yield 4,550,000 tons of magnetic concentrate with an average content of 0.7 percent V_2O_5. The district as a whole contains 16,500,000 tons of measured ore, which will yield 10,000,000 tons of magnetic concentrate with an average content of 0.6 percent V_2O_5; 12,600,000 tons of indicated ore, which will yield 8,300,000 tons of magnetic concentrate averaging 0.7 percent V_2O_5; and 13,900,000 tons of inferred ore, which will yield 2,500,000 tons of magnetic concentrate averaging 0.8 percent V_2O_5.

In the autumn of 1943 the National Lead Co., had completed pilot-mill tests and was preparing designs for a plant for the recovery of vanadium.

FOREIGN TRADE[7]

Vanadium is imported into the United States as ore and concentrates and as vanadium-bearing flue dust. During 1943 foreign ore and concentrates were imported for both private and Government account. The material received under Metals Reserve Co., contracts is subsequently converted to ferrovanadium and stock-piled. Vanadium-bearing flue dust is obtained from smokestacks and boilers of ships burning certain Venezuelan and Mexican oils and has been brought into the United States for some years, although it has been recorded in import statistics only since 1942.[8] The accompanying tables show imports of vanadium-bearing materials in 1942 and 1943, by countries, and yearly imports of vanadium ore or concentrates from 1934 to 1943, inclusive.

---

[6] Balsley, James R., Jr., Vanadium-Bearing Magnetite-Ilmenite Deposits near Lake Sanford, Essex County, N. Y.: Geol. Surv. Bull. 940-D, 1943, pp. 99-123.

[7] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[8] Vanadium-bearing flue dust is also recovered from the boiler tubes and fireboxes of American flag ships after arrival at American ports. According to the American Merchant Marine Institute (New York Times, August 29, 1943, sec. 3, p. 5), the dust is packed in bags and offered to bidders, who are permitted to make chemical analyses in advance of bidding. As marketed, the material contains 12 to 15 percent. V_2O_5. Petroleum slag, a residue from processed flue dust, is also marketed in small quantity.

1937	14, 806, 400	1, 258, 880	638, 799	1942	36, 492, 268	2, 422, 376	1, 274, 483
1938	19, 962, 880	1, 384, 320	891, 475	1943	22, 117, 131	2, 052, 620	1, 080, 150

As shown in the table of exports, shipments of vanadium ore and concentrates to foreign countries are small. It is more practicable to export vanadium as ferrovanadium, and in 1943 foreign shipments were 444,457 pounds of ferrovanadium valued at $518,322, most of which went to Canada. A large release to U. S. S. R., which was authorized in October 1943, did not appear as an export item until early in 1944.

Vanadium ore and concentrates[1] exported from the United States in 1941–43, inclusive, by countries, in pounds

Country	1941		1942		1943	
	Gross weight	Vanadium content	Gross weight	Vanadium content	Gross weight	Vanadium content
Australia					5, 160	1, 445
Canada	37, 150	17, 578	73, 542	22, 140	75, 438	26, 186
Iran					37, 676	10, 549
Japan	7, 470	3, 552				
Netherlands Indies	629	256				
United Kingdom	10, 422	4, 076

[1] Classed as ore and concentrates but probably also includes fused vanadium oxide.

WORLD PRODUCTION AND DEVELOPMENTS

Although information is not available as to recent production of vanadium in Northern Rhodesia and only 9-month totals are at hand for production in South-West Africa during 1942 and 1943, Peru appears to have continued as the principal foreign source of vanadium.

Canada.—As much as 5 percent vanadium is said to be present in copper ores being developed by Santiago Mines, Ltd., on Quadra Island 110 miles northwest of Vancouver.[9]

Early in the year there was introduced into the Canadian tariff law an item (retroactive to January 2, 1943) permitting duty- and tax-free entry of ferrovanadium and vanadium oxide into Canada for use in the manufacture of steel or iron.[10]

Germany.—Self-sufficiency of Germany in vanadium is indicated by Kroll,[11] who lists as probable sources the minette ores of France and Luxemburg, containing 0.07 percent vanadium; vanadium slags imported from Spigerwerk in Norway; and red mud from the Bayer process.

Emergency high-speed steels used in Germany are said to contain 4.30 percent vanadium.[12]

Japan.—Deficiency of vanadium in Japan is suggested by the lack of hardness in armor plate of captured Japanese material.

Peru.—The lowered production of vanadium reported in 1943 may indicate a step toward conservation of reserves at the Mina Ragra property. The new 200-ton plant for recovery of high-grade concentrates, construction of which was undertaken in 1942, was less than half-finished at the end of 1943. Completion of the plant has been retarded by scarcity of labor and materials. Gildemeister [13] has recently described research on vanadium by early Peruvian investigators and discussed possible future developments in the vanadium industry in Peru, using vanadiferous asphaltites as raw material.

Sweden.—Post-war interest in developing vanadium resources of Sweden was indicated by the action of six Swedish steelworks in acquiring rights to exploit potential vanadium-containing iron ore deposits in Kramstaberg, in Jarvso, northern Sweden.[14]

World production of vanadium in ores and concentrates, 1938–43, in metric tons

Prices	672		

SUMMARY

Production of primary tungsten concentrates in the United States advanced for the fifth successive year to establish a new record. Domestic production of primary concentrates was 12,045 short tons (60 percent WO_3 basis) in 1943, or 28 percent greater than in the previous record year 1942. The Yellow Pine mine in Idaho, which attained first place as a producer in the United States, and the Metals Reserve Co. re-treatment plant at Salt Lake City, which began operating in April, were chiefly responsible for the gain in 1943. The importance of large mining and milling units in the tungsten industry is shown by the fact that four operators producing more than 2,000 tons each supplied 79 percent of the entire output in 1943. Notwithstanding the record production in 1943, it was equivalent to only 59 percent of domestic consumption. An important event in the tungsten industry in 1943 was the initial production in North Carolina.

As a consequence of more favorable shipping conditions, receipts of imported ore and concentrates increased 21 percent over 1942 to an all-time high of 19,524 short tons (60 percent WO_3 basis) in 1943. Of the 1943 total, China supplied 47 and Bolivia 27 percent.

Salient statistics of tungsten ore and concentrates in the United States, 1939–43, in pounds of tungsten

Year	Production [1]	Shipments from mines [1]	General imports (receipts)	Consumption	Stocks at end of year			
					Consumers and brokers	Producers [1]	Government stock pile [2]	Total
1939	3,429,047	4,080,024	3,111,629	(3)	2,667,738	283,803	144,000	3,095,541
1940	4,872,806	5,062,199	9,666,228	9,955,000	2,803,249	93,618	5,417,000	8,313,867
1941	6,420,303	6,249,945	13,152,716	16,699,000	2,404,876	263,626	8,117,000	10,785,502
1942	8,977,575	8,882,403	15,409,814	17,389,000	3,416,438	355,864	9,532,000	13,304,302
1943	11,463,467	11,358,778	18,581,009	19,313,000	2,459,246	458,586	21,058,000	23,975,832

[1] Primary concentrates.
[2] Excludes secondary concentrates and milling ore.
[3] Not available.

Consumption of tungsten concentrates also established a new peak in 1943 and amounted to 20,300 short tons (60 percent WO_3 basis), an 11-percent gain over 1942.

The supplies of tungsten ore and concentrates made available in 1943 greatly exceeded requirements; as a result, stocks at the close of 1943 were 80 percent greater than at the end of 1942. Moreover, stocks at the end of 1943 were more than a year's requirements at the rate of consumption in 1943. As a consequence of the improved supply position, the War Production Board discontinued the allocation of tungsten ore and concentrates, ferrotungsten, and certain tungsten products on December 30, 1943.

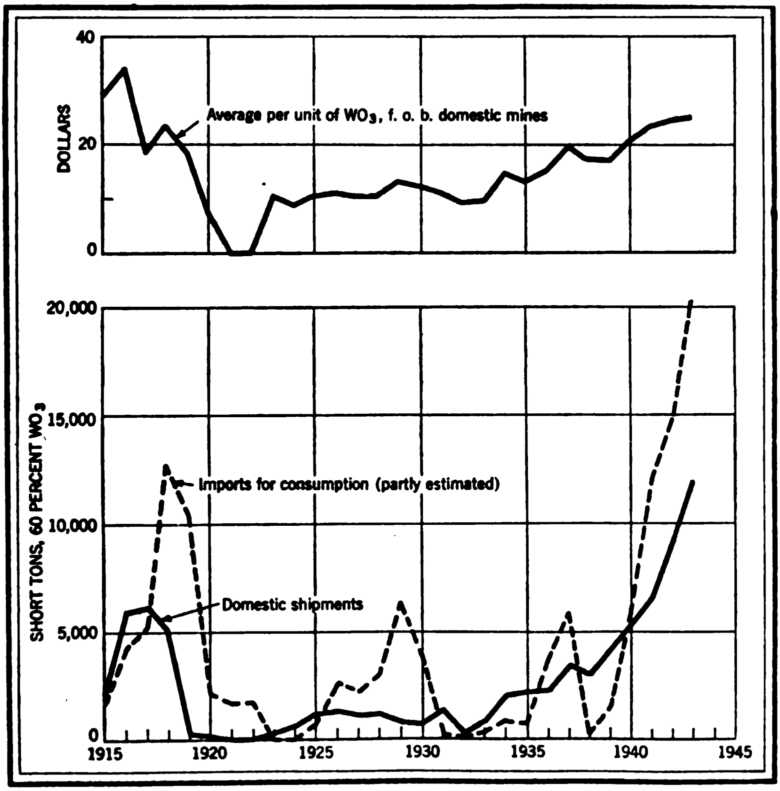

FIGURE 1.—Trends in domestic shipments, imports, and average price of tungsten ore and concentrates, 1915–43.

An excellent monograph on tungsten by Li and Wang was made available in 1943.[1]

The Bureau of Mines published a report on methods of analyzing tungsten ores.[2]

Figure 1 shows trends in domestic shipments, imports, and prices of tungsten ore and concentrates since 1915.

POST-WAR OUTLOOK

Concerning the post-war outlook for tungsten, the Engineering and Mining Journal states as follows:[3]

> The war emphasized the strategic importance of tungsten, but developed no new uses for it. The post-war outlook, therefore, is that it will recover its peacetime applications except to the extent that it has been displaced in alloy steels by other metals. Its properties are so extraordinary, however, that it is likely to grow in favor, and enjoy steady expansion in production and use. As in the past, post-war domestic production will probably be inadequate to meet home demand, and imports will be necessary.

GOVERNMENT EXPLORATION

The Geological Survey continued to expand its study and investigations of domestic tungsten deposits initiated in 1938. In 10 Western States, tungsten deposits were examined in approximately 150 areas or districts, including nearly 300 individual deposits. The Bureau of Mines continued its exploration program on tungsten deposits in Alaska, California, Colorado, Nevada, and New Mexico. The Geological Survey cooperated with the Bureau of Mines in carrying out work on these projects.

During the latter part of 1943 the newly discovered deposit of tungsten in Vance County, N. C., was explored by the Bureau of Mines. The Geological Survey cooperated with the Bureau in mapping and carrying out the work on this deposit. The exploration conducted by the Bureau in Vance County has opened an entirely new tungsten field in the Eastern States. Active exploration is now in progress on this deposit by Haile Mines, Inc., and the Lassiter Interests.

PRICES

Quotations on tungsten ore and concentrates remained steady throughout 1943. According to the Engineering and Mining Journal, Chinese, Bolivian, and Portuguese ore was quoted at $24 a short-ton unit of WO_3, duty paid, and domestic scheelite of good known analysis, in carlots, delivered, at $26 a short-ton unit. The buying price of Metals Reserve Co. for domestic ore and concentrates from "eligible" producers was $30 a short-ton unit. The average price for the domestic primary concentrates shipped in 1943, as reported to the Bureau of Mines, was $25.07 a short-ton unit of WO_3.

DOMESTIC PRODUCTION

Chiefly as a result of bringing into operation the re-treatment plant of Metals Reserve Co. at Salt Lake City, Utah, and greatly increased output at the Yellow Pine mine in Idaho, production of primary tungsten concentrates in the United States gained 28 percent over 1942 to reach an all-time high of 12,045 short tons (reduced to an equivalent of 60 percent WO_3) in 1943. The concentrates were obtained from a large number of widely scattered operations in Arizona, California, Colorado, Idaho, Missouri, Montana, Nevada, North Carolina, Utah, and Washington. However, California, Idaho, and Nevada supplied 96 percent of the total output, and four operators (United States Vanadium Corporation, Bradley Mining Co., Nevada-Massachusetts Co., and Metals Reserve Co.) produced 79 percent of the United States total. Idaho displaced California as the principal producing State in 1943.

---

[3] Engineering and Mining Journal, Metals for the Alloy Steels: Vol. 145, No. 2, February 1944, p. 84.

In addition to the output of 12,045 tons of primary concentrates, 17,400 tons of secondary concentrates (11.75 percent WO_3), which require further milling, and a considerable tonnage of milling ore were produced in 1943. The bulk of these concentrates was shipped to the re-treatment plant of Metals Reserve Co. at Salt Lake City, Utah; the ore was shipped to the re-treatment plant and to various purchasing depots of Metals Reserve Co. Some of the secondary concentrates shipped to the re-treatment plant in 1942 and 1943 were treated during 1943, and the resultant primary concentrates recovered are included in the 1943 production and shipment figures.

Tungsten ore and concentrates shipped from mines in the United States, 1939–43

Year	Quantity		Reported value f. o. b. mines		
	Ore and concentrates, 60 percent WO_3 (short tons)	Tungsten content (pounds)	Total	Average per unit of WO_3	Average per pound of tungsten
1939	4,287	4,080,024	$4,402,182	$17.11	$1.08
1940	5,319	5,062,199	6,576,318	20.61	1.30
1941	6,567	6,249,945	9,223,726	23.41	1.48
1942	9,333	8,882,403	13,508,266	24.12	1.52
1943	11,935	11,358,778	17,954,885	25.07	1.58

Alaska.—At the Riverside mine near Hyder, mining was resumed in May with a skeleton crew, and milling was started in June on a one-shift basis. During 1943 about 500 short tons of ore averaging 1 percent WO_3 were milled, from which 25 tons of concentrates averaging 10 percent WO_3 were recovered and placed in stock. Because of the low quality of these concentrates, they have been omitted from the 1943 statistics.

Arizona.—Production of primary tungsten concentrates in Arizona was 60 short tons averaging 55.03 percent WO_3 in 1943 compared with 181 tons averaging 69.23 percent WO_3 in 1942. Shipments were 65 tons averaging 57.29 percent WO_3 in 1943 and 192 tons averaging 68.44 percent WO_3 in 1942. The large decline in production and shipments was due chiefly to suspension of operations in February at the Boriana mine near Yucca, Mohave County, where output dropped from 128 tons in 1942 to 15 tons in 1943. The remainder of the output came from a number of widely scattered operations, chiefly the Black Gold mine in Pima County, Chloriding and Diff claims in Mohave County, and Maudina and Morning Star mines in Pinal County.

In addition to the primary tungsten concentrates produced and shipped in 1943, small quantities of milling ore were shipped to the Parker and Phoenix depots of Metals Reserve Co. This ore has been omitted from the 1943 statistics.

California.—After holding first place since 1940 as a producer of primary tungsten concentrates, California was displaced by Idaho in 1943. However, production was 11 percent greater than in 1942. Output of primary tungsten concentrates was 3,559 short tons averaging 65 percent WO_3 in 1943 compared with 3,324 tons averaging 63 percent WO_3 in 1942. Of the 1943 total, Inyo County supplied 74.7 percent; San Bernardino 12.6 percent; Tulare 5.8 percent; Madera 4.0 percent; and El Dorado, Fresno, Kern, Mono, Riverside, and San Diego together 1.7 percent; the source of 1.2 percent was not reported.

Shipments of tungsten concentrates from California totaled 3,569 short tons averaging 65.07 percent WO_3 in 1943 compared with 3,334 tons averaging 62.68 percent WO_3 in 1942. Although primary tungsten concentrates were shipped from a large number of widely scattered operations, 6 producers—the Atolia Mining Co. and Hoefling Bros. (in San Bernardino County), the United States Vanadium Corporation and Tungstar Corporation (in Inyo County), Haggerty & Madden (in Madera County), and Consolidated Tungsten (in Tulare County)—supplied 3,299 tons or 92 percent of the State total. The bulk of the remainder was shipped from the Garnet Dike mine in Fresno County; Schober, Tungsten City, and Marble mines in Inyo County; and Big Jim mine in Tulare County.

In addition to the primary tungsten concentrates produced and shipped in 1943, 516 short tons of secondary concentrates averaging 13.88 percent WO_3 were shipped to the re-treatment plant of Metals Reserve Co. at Salt Lake City, Utah, for further milling. A small quantity of milling ore was also shipped to the Salt Lake City mill, and small quantities of secondary concentrates and milling ore were shipped to the Fresno (Calif.) depot of Metals Reserve Co. The secondary concentrates and milling ore shipped to Salt Lake City and Fresno have been omitted from the 1943 statistics, but the resultant primary concentrates recovered will be included in later figures. The bulk of these secondary concentrates was shipped by Martin & Krebs, Tungstar Corporation, and West Coast Tungsten Co.

The largest producer in California and the second largest producer of primary concentrates in the United States during 1943 was the United States Vanadium Corporation, which operated the Pine Creek mine near Bishop and, in addition, milled some ore from the Adamson mine of Panaminas, Inc. Production of concentrates was 13 percent less than in 1942.

The Tungstar Corporation, operating the Tungstar mine near Bishop, was the second largest producer in California in 1943. Output of primary concentrates was four and one-half times that of 1942.

Hoefling Bros., who began operations December 10, 1942, at the Spud Patch Placer in San Bernardino County, made a substantial production of concentrates averaging 66 percent WO_3 in 1943. The deposit being worked is a residual placer lying below the well-known Atolia vein system. The ore consists of fragments of scheelite in a sand and gravel streak approximately 4 feet thick, covered with 6 to 30 feet of sand overburden. Mining is done with dragline power shovel. The ore is hauled 4 miles to a jigging plant for treatment.

The Harrel Hill mine in Tulare County, operated by Consolidated Tungsten, was an important producer of tungsten concentrates in 1943, as was also the new Strawberry mine in Madera County, operated by Haggerty & Madden, which began producing in September.

Production at the Atolia mine in San Bernardino County, operated by the Atolia Mining Co.—the largest producer during World War I—was at a much lower rate than in 1942.

The remaining output of primary tungsten concentrates in California in 1943 came from a large number of smaller operations, but most of it was produced by the Tulare County Tungsten Mines, operating the Big Jim mine in Tulare County; the Tungsten City Milling Syndicate, treating Tungsten City tailings, El Diablo Mining Co., operating the Schober and Brownstone mines, and Marble Tungsten Co., operating the Marble mine, all in Inyo County; and Sheridan, Bennett & Kidder, operating the Garnet Dike mine in Fresno County.

Colorado.—Production of primary tungsten concentrates in Colorado declined to 412 short tons averaging 50 percent WO_3 in 1943 from 492 tons averaging 46 percent WO_3 in 1942, but shipments (378 tons, 60 percent WO_3 basis) were slightly greater than in 1942. The 1943 production and shipment figures include 73 short tons of concentrates averaging 65 percent WO_3, which were recovered at the Salt Lake City (Utah) mill from the milling of secondary concentrates originating in Colorado.

In addition to the primary tungsten concentrates produced and shipped in 1943, Boulder Tungsten Mills (Inc.) and George H. Teal & Associates shipped 1,342 short tons of secondary concentrates averaging 8.24 percent WO_3 to the re-treatment plant of Metals Reserve Co. at Salt Lake City, Utah, for further milling. A considerable quantity of milling ore was shipped to the Nederland and Salida depots of Metals Reserve Co. during 1943. These secondary concentrates and milling ore have been omitted from the 1943 statistics, but the resultant primary concentrates recovered are included.

Most of the primary tungsten concentrates produced in Colorado in 1943 came from operations of the Wolf Tongue Mining Co. and the Vanadium Corporation of America and from milling of Colorado secondary concentrates at the Salt Lake City Mill of Metals Reserve Co.

Idaho.—Idaho attained the rank of leading producer of primary tungsten concentrates in the United States in 1943. Production again increased phenomenally and totaled 5,418 short tons averaging 54.02 percent WO_3 in 1943 compared with 2,389 tons averaging 53.55 percent WO_3 in 1942. Shipments of primary concentrates were 5,186 tons averaging 53.78 percent WO_3 in 1943 compared with 2,366 tons averaging 53.45 percent WO_3 in 1942. The 1943 production and shipment figures include 1,847 tons of concentrates averaging 65 percent WO_3, which were recovered at the Salt Lake City (Utah) mill from the milling of secondary concentrates originating at the Yellow Pine mine of Bradley Mining Co.

The Yellow Pine mine near Stibnite, Valley County, where tungsten production was begun by the Bradley Mining Co. in August 1941, was the largest producer in the United States in 1943. Although this mine was the second-largest producer of primary concentrates in 1942, its output of both primary and secondary concentrates exceeded that of any other mine in 1942. In 1943 the Yellow Pine mine produced and treated 178,747 short tons of scheelite ore averaging 2.08 percent WO_3, which yielded 3,382 tons of primary concentrates (47.60 percent WO_3) and 12,940 tons of secondary concentrates (11.57 percent WO_3). These secondary concentrates, which were shipped to the re-treatment plant at Salt Lake City for further milling, are not included in the 1943 statistics; instead, the resultant primary concentrates recovered are included. The Yellow Pine mine has been described recently by Bailey.[4]

Production of hübnerite concentrates at the Ima mine in the Blue Wing district, Lemhi County, was 43 percent greater than in 1942.

Talache Mines (Inc.) produced a small tonnage of secondary concentrates (7.81 percent WO_3) at its Atlanta Group of claims near Atlanta, Elmore County, in 1943. These concentrates, which are mill feed for the re-treatment plant at Salt Lake City are not included in the 1943 statistics.

Missouri.—A small quantity of hübnerite (45 units of WO_3) was shipped from Madison County in 1943.

Montana.—A dredge and a mill, including jigs and a magnetic separator, were put into operation in 1943 by the H & H Mines to work the gravel containing scheelite and gold in Henderson Creek, near Hall, Granite County; 601,809 cubic yards averaging 0.04 pound WO_3 per cubic yard were treated, which yielded 16 short tons of primary concentrates (52.43 percent WO_3) and 167 tons (2.34 percent WO_3) of unfinished dredge and table concentrates. The dredge commenced operation on lower Henderson Creek in untested ground where scheelite values were low. Results of testing upstream are said to show scheelite values averaging about 0.15 pound per cubic yard of gravel.

Some milling ore produced in Montana was shipped to the re-treatment plant at Salt Lake City, Utah. This ore has been omitted from the 1943 statistics.

---

[4] Bailey, H. D., Yellow Pine Mine—Strategic Metal Bonanza: Compressed Air Magazine, vol. 48, No. 11, November 1943, pp. 7189–7192.

Nevada.—Nevada dropped from second to third place as a producer of tungsten in 1943. Production and shipments of primary concentrates (reduced to an equivalent of 60 percent WO_3) were 2,819 and 2,910 short tons, respectively, in 1943 compared with 3,135 and 3,052 tons, respectively, in 1942. The 1943 production and shipment figures include 120 tons of concentrates averaging 65 percent WO_3, which were recovered at the Salt Lake City (Utah) mill from the milling of secondary concentrates originating at Getchell Mines (Inc.).

The Nevada-Massachusetts Co. and affiliated companies, operating mills at Mill City, Golconda, and Toulon, were the chief producers in Nevada in 1943. The concentrating mill of the Nevada-Massachusetts Co. at Mill City was destroyed by fire on November 11; it will be rebuilt. Smaller but important producers of primary concentrates in 1943 were Nevada Scheelite, Inc., operating the Leonard mine in Mineral County; Tungsten Metals Corporation, operating the Scheelite Chief, Oriole, Everitt, and Silver Bell mines in White Pine County; and M. G. L. Mining Corporation operating the M. G. L. mine in Pershing County. The remaining production of primary concentrates in Nevada in 1943 came from a large number of smaller operations, but the bulk was produced by Lincoln Mines, Inc., operating the Tem-Piute mine in Lincoln County; Cherry Creek Tungsten Mining Co., operating the Cherry Creek mine in White Pine County; and Defense Tungsten Mines, operating the Defense Tungsten mine in Humboldt County.

In addition to the primary tungsten concentrates produced and shipped in 1943, 2,476 tons of secondary concentrates averaging 13.66 percent WO_3 were shipped to the re-treatment plant at Salt Lake City for further milling. Considerable milling ore was also shipped to Salt Lake City and to the Battle Mountain and Winnemucca depots of Metals Reserve Co. These secondary concentrates and milling ore have been omitted from the 1943 statistics, but the resultant high-grade concentrates are included. The bulk of these secondary concentrates was shipped by Getchell Mines, Inc. The remainder came chiefly from the Lincoln, Cherry Creek, M. G. L., and Star Tungsten mines.

The flotation plant of Getchell Mines, Inc., which was put into operation in August 1942, treated 92,737 short tons of scheelite ore averaging 0.415 percent WO_3 during 1943, from which 2,315 tons of concentrates averaging 13.55 percent WO_3 were recovered. The ore treated came from the company mines in Humboldt County and from the Richmond and Rose Creek mines in Humboldt and Pershing Counties, respectively, operated by W. C. Rigg.

The Rose Creek mine in Pershing County has been described by Roberts.[5]

New Mexico.—During 1943 a small quantity of milling ore was produced in New Mexico and shipped to the Deming depot of Metals Reserve Co., and a small quantity of concentrates was produced from New Mexico ore by Alloy Metals at its mill near El Paso, Tex. These quantities have been omitted from the 1943 statistics.

North Carolina.—An important event in 1943 was the initial production of 40 short tons of hübnerite concentrates averaging 70 percent

---

[5] Roberts, R. J., The Rose Creek Tungsten Mine, Pershing County, Nev.: Geol. Survey Bull. 940-A, 1943, 14 pp.

WO_3 in North Carolina. The concentrates were produced by Richard and Joseph Hamme and Haile Mines, Inc. The ore milled averaged 1 percent WO_3. The deposits, which are in Vance County, were discovered by Richard and Joseph Hamme while searching for gold. During 1943 the holdings of Hamme Bros. were acquired by Haile Mines, Inc., which has plans for a modern mill of 100-ton capacity.

South Dakota.—Production of tungsten in South Dakota in 1943 comprised a small quantity of milling ore, which was shipped to the Deadwood depot of Metals Reserve Co., and 2 tons of concentrates averaging 26.33 percent WO_3, which were shipped to the re-treatment plant at Salt Lake City, Utah. These quantities have been omitted from the 1943 statistics.

Utah.—Production of high-grade tungsten in Utah was 20 short tons averaging 62 percent WO_3 in 1943 compared with 33 tons averaging 54 percent WO_3 in 1942. Shipments were also 20 tons averaging 62 percent WO_3 in 1943 compared with 30 tons averaging 57 percent WO_3 in 1942. The high-grade tungsten was produced in Beaver, Box Elder, and Tooele Counties.

In addition to the high-grade tungsten produced and shipped in 1943, a considerable quantity of milling ore was shipped to the re-treatment plant at Salt Lake City for further milling. This ore has been omitted from the 1943 statistics, but the resultant high-grade concentrates recovered will be included in later figures. Most of this ore was produced at the Desert mine in Juab County, Star Dust and Traction Lode mines in Tooele County, Scheelite Queen in Millard County, Lone Pine mine in Box Elder County, and Garnet mine in Beaver County.

The re-treatment plant of Metals Reserve Co. at Salt Lake City began operating in April 1943 and during the remainder of the year treated 13,370 short tons of concentrates averaging 11.43 percent WO_3. The mill feed comprised chiefly secondary concentrates from the Yellow Pine mine of Bradley Mining Co. The remainder was mostly secondary concentrates from Getchell Mines, Inc. The resultant primary concentrates produced and shipped during 1943 have been credited in the statistics to Idaho, Nevada, and Colorado. The milling process has been recently described.[6]

Washington.—Discontinuing of operations by the General Electric Co. at the Germania mine near Fruitland, Stevens County, is reflected in the production in Washington, where output declined to 2 tons in 1943 (75 tons in 1942). Shipments were 3 tons averaging 67.83 percent WO_3 in 1943 compared with 73 tons averaging 35.48 percent WO_3 in 1942.

Wyoming.—Production in Wyoming comprised milling ore averaging 2.25 percent WO_3, chiefly from the Romur mine in Fremont County, some of which was shipped to the re-treatment plant at Salt Lake City and some to the Nederland (Colo.) depot of Metals Reserve Co. A car of ore was shipped to the re-treatment plant at Salt Lake City by J. M. Keahy. These quantities have been omitted from the 1943 statistics.

FOREIGN TRADE [7]

Domestic production of tungsten is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. Receipts of imported ore and concentrates established a new peak in 1943 and totaled 18,581,009 pounds (tungsten content), equivalent to 19,524 short tons of 60 percent WO_3. Although ore and concentrates were received from 13 foreign countries in 1943, four—China (47 percent), Bolivia (27 percent), Argentina (11 percent), and Brazil (6 percent)—supplied 91 percent of the total.

Imports in 1943 for consumption amounted to 19,347,600 pounds (tungsten content), equivalent to 20,329 short tons of 60 percent WO_3; China, Bolivia, Argentina, and Brazil supplied 47, 26, 12, and 6 percent, respectively, of the total.

Tungsten ore and concentrates imported into the United States, 1942–43, by countries

[1] Comprises ore and concentrates received in the United States; part went into consumption during year, and remainder entered bonded warehouses.

[2] Comprises ore and concentrates withdrawn from bonded warehouses during year (irrespective of time of importation) and receipts during year for consumption.

[3] In addition, 12,000 pounds containing 6,115 pounds of tungsten and valued at $7,308 were imported for smelting, refining, and export.

---

[7] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The duty on tungsten ore or concentrates is 50 cents per pound on the metallic tungsten contained therein. This is equivalent to $7.93 per short ton unit.[8]

Exports of tungsten ore and concentrates from the United States are insignificant and totaled only 2,416 pounds in 1943 compared with 15,714 pounds in 1942.

No tungsten metal was imported in 1943 compared with 4,435 pounds (tungsten content) in 1942. No ferrotungsten, tungsten carbide, tungstic acid and other compounds of tungsten, or combination containing tungsten or tungsten carbide were imported in 1942 and 1943.

Exports of metal, wire, shapes, and alloys other than ferrotungsten were 230,415 pounds in 1943 compared with 313,164 pounds in 1942. Exports of ferrotungsten were 1,032,649 pounds in 1943 compared with 266,955 pounds in 1942. Exports of sodium tungstate and tungstic acid were 1,508 and 51,703 pounds, respectively, in 1943 compared with 1,419 and 39 pounds, respectively, in 1942.

CONSUMPTION AND USES

Consumption of tungsten ore and concentrates in the United States was about 20,300 short tons (60 percent WO_3 basis) in 1943 compared with 18,300 tons in 1942. Of the total consumed in 1943, 12,300 tons or 61 percent were converted to ferrotungsten, the form in which most of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; and 2,900 tons, or 14 percent of the total, were so used in 1943. Metallic tungsten and other tungsten products, chiefly the former, employed about 5,100 tons or 25 percent of the total ore and concentrates consumed in 1943.

The chief use of tungsten, according to quantity, is in the manufacture of cutting tools, the majority of which are made of high-speed steel containing about 18 percent tungsten, 4 percent chromium, and 1 percent vanadium—commonly known as "18-4-1". Smaller quantities of tungsten are used in numerous other types of high-speed steels. Molybdenum-tungsten high-speed steels (which contain 1 to 2 percent tungsten and 5 to 10 percent molybdenum) are being used successfully for many applications of tungsten high-speed steels. Other important uses of tungsten are in armor-piercing projectiles, bullet cores, erosion-resisting gun liners, stellite and tungsten carbide cutting tools, magnet steels, and austenitic valve steels and valve seats. Minor amounts of tungsten are used in lamp and radio-tube filaments, X-ray tubes, fluorescent lamps, and electrical contact points. Tungsten salts are used in the chemical, pigment, and tanning industries.

WORLD PRODUCTION

Because of restrictions on the publication of statistics by many governments, a record of recent production in many countries is not available.

---

[8] A unit, as applied to tungsten ores, is 1 percent of a ton of tungsten trioxide (WO_3). Thus, a short-ton unit is 20 pounds of WO_3 or 15.86 pounds of tungsten (W).

World production of tungsten ores, 1937–43, by countries, in metric tons of concentrates containing 60 percent WO_3[1]

---

[1] In addition to countries listed, tungsten ore is produced in Japan, U. S. S. R., and Western Australia, but data on production are not available.

[2] Data not available.

[3] Estimate.

[4] January to June, inclusive.

[5] Less than 1 ton.

[6] January to September, inclusive.

Argentina.—Argentina ranks second to Bolivia as a producer of tungsten in South America. Output comes principally from the Provinces of San Luis and Córdoba; much smaller amounts are produced in San Juan, Catamarca, Mendoza, and La Rioja. Production was 2,200 and 1,923 metric tons (66 percent WO_3), respectively, in 1943 and 1942.

Bolivia.—Bolivia is the largest tungsten producer in South America. Most of the deposits are in the Departments of La Paz, Oruro, Potosí, and Cochabamba. Output (as indicated by exports) was 6,932 and 5,606 metric tons (60 percent WO_3 basis), respectively, in 1943 and 1942.

Brazil.—Heretofore an insignificant source of supply of tungsten, Brazil became an important producer in 1943 as a consequence of the recent discovery of deposits of scheelite in the Municipalities of Parelhas, Serra Negra, and São Joao do Sabogi in the State of Rio Grande do Norte and in the Municipality of Santa Luzia in the State of Paraiba. Exports were 1,167 metric tons, averaging about 65 percent WO_3 in 1943.

China.—Much information concerning the tungsten deposits of China, the world leading producer, is contained in the excellent monograph entitled Tungsten, by K. C. Li and C. Y. Wang. According to these authors, about 95 percent of the Chinese output comes from Kiangsi, Hunan, and Kwangtung, of which Kiangsi is by far the most important, contributing, as it does normally, 70 percent of China's total production. Production figures for China are not available for 1943, but 9,138 short tons (60 percent WO_3 basis) were received in the United States.

Cuba.[9]—The attempt to make a profitable production of tungsten concentrates by the Pan American Tungsten Corporation at the Lela mine on the Isle of Pines was unsuccessful, and operations were suspended. Approximately 6 tons of tungsten concentrates were produced and exported in 1943.

Peru.—In Peru, a relatively small producer of tungsten, the most important deposits are in the Departments of Ancash and La Libertad; there are other deposits in the Departments of Huancavelica and Puno. Production is estimated at 500 metric tons of 60 percent WO_3 in 1943 compared with 471 tons averaging about 65 percent WO_3 in 1942. Exports were 654 metric tons, averaging 64 percent WO_3 in 1943 and 337 tons in 1942; the WO_3 content of the 1942 exports is not available.

SUMMARY

Few people could have guessed in 1942 that the end of 1943 would witness an overabundance of aluminum for the war program. Yet, at the close of the year stocks of metal were accumulating so rapidly that cut-backs in production totaling 30 percent of installed capacity were made between December 1943 and July 1944. Such a possibility had, at best, seemed very remote during the lean months of 1942 and early 1943. Production (920,179 short tons) and consumption (877,381 tons) of primary aluminum in 1943 advanced 77 and 49 percent over 1942. The annual rate of production at the end of 1943 had risen to about 1,100,000 short tons, but cut-backs in output will cause 1944 production to drop to about 867,000 tons. Imports from Canada are expected to total about 77,000 tons in 1944, thus making the apparent total available supply of primary aluminum more than 940,000 tons. In addition, stocks in Canada (owned by the United States) of metal produced under contract with the Aluminum Co. of Canada exceeded 150,000 tons on May 1, 1944, and may total as much as 400,000 tons by the end of the year. Secondary production in 1944 is estimated at an additional 350,000 tons.

Highlights of the industry in 1943 included the following: All primary metal facilities being constructed under the War Production Board expansion program were completed; the two Defense Plant Corporation alumina plants were completed and produced alumina during the year; lime-soda-sinter units were begun at each of the four largest alumina plants to increase output from low-grade ores and by early 1944 were virtually complete; nearly all fabricating facilities being constructed under the auspices of the War Production Board were completed by the end of the year; and plans were made for the construction of three semicommercial plants designed to produce alumina from low-grade domestic materials other than bauxite.

Recovery of secondary aluminum increased 60 percent in 1943. Imports and exports of crude and semicrude aluminum in 1943 increased 21 and 203 percent, respectively, compared with 1942.

---

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Mine shipments (6,746,528 short tons) and consumption (5,332,151 tons) of bauxite in 1943 increased 144 and 89 percent, respectively, compared with 1942. Owing to large stocks of bauxite held by private industry and Government and to curtailed consumption, it is estimated that bauxite output in 1944 will aggregate approximately 4,000,000 tons compared with the actual production of 6,980,829 tons in 1943. Imports of bauxite, placed on a B–2 shipping priority, are estimated at 400,000 long tons in 1944. Estimated requirements of bauxite by all industries in 1944 are placed at 4,750,000 short tons, slightly in excess of predicted supply. Any deficiency in supply, however, will be more than taken care of from the 4,800,000 tons of ore in stock piles as of the end of 1943. Late in 1943 restrictions on bauxite and alumina, embodied in General Preference Order M–1–h, were somewhat relaxed. Authorization to deliver restricted grades of ore to alumina and abrasive manufacturers was removed as a requirement, and the method of securing authorization for delivery to other industries was simplified.

In 1943 imports of bauxite (1,733,596 short tons, 77 percent of which came from Surinam) increased 75 percent over 1942, and exports (592,300, dried equivalent) rose 80 percent. Both the import and export totals represent new all-time records. Of the domestic and foreign bauxite consumed, the alumina industry used 89 percent; chemical, 3 percent; abrasive and refractory, 7 percent; and other industries, 1 percent. Compared with 1942 the alumina industry increased its consumption of bauxite approximately 114 percent, abrasive and refractory 10 percent, and other uses 23 percent, whereas bauxite used in the chemical industry decreased 30 percent. Domestic ore was equivalent to 74 percent and imports to 26 percent of the total bauxite consumed. Shipments from Arkansas comprised 97 percent of the total domestic output, and production in Georgia, Alabama, and Virginia rose substantially above that in 1942. The average value actually received for all grades of ore shipped in 1943 dropped 5 percent from 1942.

World production of bauxite is believed to have increased 60 percent and of aluminum 35 percent in 1943. United Nations output of aluminum and bauxite in 1942 was estimated at 70 and 79 percent of the world totals and may decline slightly in 1944.

Salient statistics of the bauxite and aluminum industries in the United States, 1941–43

	1941	1942	1943
Bauxite:			
Production (mine shipments)[1] ....short tons..	1,001,475	2,768,343	6,746,528
Value [2]	$5,358,976	$12,934,025	$32,744,109
Imports [2] ....short tons..	1,250,532	990,323	1,733,596
Exports (including concentrates)[2] ....do....	150,916	291,872	467,248

BAUXITE

PRODUCTION

Another all-time high was recorded in 1943 when bauxite production and mine shipments reached unprecedented levels. Actual mine production increased from 2,914,278 short tons (dried equivalent) in 1942 to 6,980,829 tons in 1943, a gain of 140 percent. Mine shipments upon a dried-equivalent basis increased 144 percent in quantity and 153 percent in value over 1942. Production rose 150 percent in Arkansas, 18 percent in Alabama, and 140 percent in Georgia and decreased 37 percent in Virginia. No bauxite production was reported from Mississippi, although a small quantity of ore had been reported from Kemper County in 1942.

Arkansas mines in Saline and Pulaski Counties contributed 97 percent of the total domestic shipments in 1943 as compared with 94 percent in 1942. American Cyanamid & Chemical Corporation operated the Heckler, Rauch Leased, Rauch Owned, England, and Berger No. 100 mines in Pulaski County and the Townsend, Cargill, Cleveland, Fletcher, Consolidated (Gates lease), Globe No. 28, McDonald, Ozark No. 24, Ozark No. 28, and Quapaw mines in Saline County. All except the McDonald, Cleveland, Ozark No. 28, and Berger No. 100 mines were operated during 1942. The company also operated a gas-fired rotary-kiln drying plant at Berger, Pulaski County, and a similar plant at West Bauxite, Saline County. The calcining plant at West Bauxite was not operated during the year, but the company sintering plant at the same location was active throughout the year and supplied sintered ore to the abrasive industry. The Bierman property in Pulaski County, on which development was done in 1942 by Consolidated Chemical Industries, Inc., was idle throughout the year, and the Gates lease (otherwise known as the Alexander No. 2 mine) was surrendered to the lessor. Crouch Mining Co., Inc. (owned by General Abrasives Co.), mined and calcined ore from its Young mine near Bauxite, Saline County, solely for the abrasives industry. Dixie Bauxite Co. mined ore from its Dixie No. 2 mine near Sweet Home, Pulaski County, for direct sale to the aluminum industry and for the Metals Reserve Co. account. Dulin Bauxite Co., Inc., produced ore from the Harley, Reichardt, Thorpe, Penzel, Brown, and Ratcliffe mines in Pulaski County and from the Harris (Bryant) mine in Saline County. The latter property was sold to the Osage Bauxite Co. of Bryant, Saline County, on June 4, 1943. The company calcining plant near Sweet Home was active throughout the year and produced calcined bauxite for use in abrasives. Norton Co. continued operation of its Norton mine and calciner near Bauxite during 1943.

Porocel Corporation operated its plant at Berger, Pulaski County, where dried bauxite is milled, activated, and purified by magnetic separation; it also operated a new plant at the same location where low-iron activated bauxite is impregnated with anhydrous aluminum chloride for use as a catalyst in the production of high-octane aviation gasoline. The company has no mine of its own and purchases all requirements of dried ore from local producers. The old Ratcliffe open-pit mine of Republic Mining & Mfg. Co. was operated during the year to supply the Drury calcining plant of Aluminum Ore

Co. with high-grade ore, part of which was calcined for the abrasive trade and part of which was dried for consumption in alumina plants operated by the latter company. Both companies are subsidiaries of Aluminum Co. of America. At Bauxite, Saline County, Republic operated a large number of mines and two drying plants, including a large, new plant more than doubling the company drying capacity. Underground mines in Saline County operated by Republic included the following: Neilson, Section 26, Bertha, and Young. Open-cut mines included Elrod, Lantz, Section 10, Canal No. 1, Canal No. 2, Section 14, African Camp, Alexander Hill, Section 15, Lone 7th, Pruden, Pruden Extension, Poodle, Section 17, Spring Hill, Smith, Section 16, Maggie, Julia, Davis (includes underground workings), Bertha Extension, South Maud, East Maud, Middle Maud, and West Maud. Reynolds Mining Corporation became a major producer in the domestic bauxite industry in 1943, operating underground and open-cut mines in both Saline and Pulaski Counties. In Pulaski County the Sherrill and Hoekstra mines were operated as open-cuts, and in Saline County the Stuckey and Ulmer open-cut and the Hurricane Nos. 1 and 3 and Covington Nos. 4 and 5 underground mines were active during the year.

All of the aforementioned companies produced bauxite for sale directly to the alumina, chemical, abrasive, or other industries; in addition, most of them sold substantial quantities of crude ore to the Metals Reserve Co. for stock-piling and for use in the two large Government-owned alumina plants at Hurricane Creek, Ark., and Baton Rouge, La. The following companies and individuals, on the other hand, produced crude ore solely for sale on contract to the Metals Reserve Co.: Aluminite Mining Corporation (Winn, open-cut), Arkansas Bauxite Stripping Co. (Willie Thomas and McGuire, both open-cut), Fourche Mountain Mining Co. (Rauch North 20, open-cut), Hardin and Prewitt (Keenzel, open-cut), Jackson and Squire (Hoekstra-Dobbs-Illing tract, open-cut), Kenark Mining Co. (Westminster Church-Thomas-Barner-Porter tract, open-cut), Roy Prewitt (Morgan, open-cut), Pulaski Mining Co. (Burke and Nelson, open-cut), E. G. Shoffner, Receiver (Sam J. Lewis, open-cut), Sweet Home Bauxite Co. (Sweet Home, open-cut), Victory Bauxite Co. (Weiss, open-cut), and Wells Mining Co. (Wright, underground), in Pulaski County; and S. E. Evans Construction Co. (Bizzell and Fletcher-Hudspeth-Harris, open-cut), Maner Graham (Hogue-Fletcher, open-cut), Hull-Macke Bauxite Co. (Childress property, underground), Hurricane Creek Mining Co. (Cleveland-Evans, open-cut), Osage Bauxite Co. (Bryant, underground), Schafer and Haire (Martin, underground), Taff, Fleming, Dryden, and McWorkman (Rowland, underground), and P. C. Upton (Ramsey, open-cut) in Saline County. Many of this group of operators have already curtailed or discontinued operations owing to the cut-back in bauxite production and at certain operations to exhaustion or poor grade of deposits. One new company that came into the producing field early in 1944 and is expected to be a large operator during the coming year is Midwest Mines Co., which is working the Gray open-cut mine.

Mines in Alabama increased production slightly during 1943, but the rate of increase was not nearly as great as in Arkansas or Georgia. Bauxite Co. of Alabama, Barbour Bauxite Co., General Ore Co., Republic Mining & Mfg. Co., and D. M. Wilson Bauxite Co. were active in the Eufaula district in Barbour and Henry Counties during the year. The ore was sold in both crude and dried form to the alumina, chemical, refractory, and oil-refining industries. Drying plants were operated by Bauxite Co. of Alabama, General Ore Co., Chas. Lennig & Co., Inc., and Republic Mining & Mfg. Co. The drying kiln operated by Lennig is an old-fashioned rotary-drum drier fired with wood.

Bauxite shipped from mines in the United States, 1939–43, by States

State and year	Short tons					Value, f. o. b. mine, as shipped
	Crude	Dried	Calcined and sintered	Total		
				As shipped	Dried-bauxite equivalent

[1] Includes Virginia.

[2] Includes Mississippi and Virginia.

In Georgia the bulk of the 1943 production was by American Cyanamid & Chemical Corporation from its Thig Pen mine in the Andersonville district, Sumter County. A small tonnage of ore was mined by the Bethlehem Co. from the Irwinton No. 1 and Toomsboro-Dixon mines near Irwinton, Wilkinson County. Republic Mining & Mfg. Co. reported a small production during the year from its mines in the Hermitage area of Floyd County. Driers were operated by Republic and Cyanamid at their respective mines, and all ore sold from Georgia (nearly all dried bauxite) was consigned to the chemical industry.

Republic Mining & Mfg. Co. continued to operate the Allen, Harris, and Lightner properties near Spottswood, Augusta County, Va., the first half of 1943. All ore was shipped crude to chemical and refractory companies.

A canvass of bauxite producers, conducted by the Bureau of Mines in November and December 1943, indicated that 1944 production would be about 4,000,000 short tons. On the other hand, production for the first 4 months of the year indicates a total annual output of only about 3,000,000 long tons or 3,336,000 short tons. Output will probably fall somewhere between these limits. Studies by the Bureau of Mines and Federal Geological Survey were continued in Arkansas and the Southeastern States during 1943.

The Bureau of Mines conducted intensive drilling operations during 1943 in both Saline and Pulaski Counties, Ark., using 20 drill rigs. The number of holes drilled and accepted for payment totaled 2,193, representing 521,921.5 feet of drilling. During the year 7,574,425 natural long tons of merchantable bauxite were delimited by drilling, in addition to 6,618,405 tons of submarginal bauxite and bauxitic clay. The average tonnage of merchantable bauxite discovered per hole was 3,453.9 and per foot drilled was 14.5, and the average total tonnage of bauxite and bauxitic clay discovered per hole was 6,471.9 and per foot drilled was 27.2. From December 1941 to January 1, 1944, the total merchantable ore discovered was 10,562,822 tons and the total submarginal bauxite and bauxitic clay 9,599,390 tons. For the entire 2-year period the average discovery cost per ton of bauxite was $0.043, including geophysics, laboratory costs, and drilling cost. Drilling and exploration were also carried on in Alabama and Georgia, and a considerable quantity of ore was discovered. Studies have shown, however, that the major reserves of presently merchantable bauxite in the United States occur in Arkansas.

In 1943 the Geological Survey continued its work in Arkansas, Alabama, Georgia, and Tennessee in examining deposits and locating and logging drill holes and in furnishing information for the war minerals reports on bauxite prepared by the Bureau of Mines. An excellent and concise summary of the geology of the Arkansas bauxite district is found on a subsurface contour map published February 1, 1944, by the Geological Survey.[3] The following excerpts from this summary are quoted:

> Deposits of bauxite and high-alumina clay are found at the base of the early Tertiary (Eocene) nonmarine sedimentary rocks of the Wilcox formation, which comprises at least 600 feet of sand, silt, clay, carbonaceous clay, and lignite. These nonmarine sedimentary beds dip gently to the southeast and lie unconformably upon an eroded surface of considerable relief developed on (1) marine sedimentary rocks of still earlier Tertiary (Paleocene) age—the Midway formation, (2) nepheline syenite—an intrusive igneous rock of Cretaceous (?) age, and (3) folded, steeply dipping, somewhat metamorphosed Paleozoic sedimentary rocks.
>
> The bauxite and the high-alumina clay were derived through the weathering of these rocks during the interval of geologic time represented by the unconformity at the base of the Wilcox formation * * *.
>
> Nepheline syenite is composed essentially of feldspars and feldspathoid minerals, which are silicates of aluminum and alkalies. The nepheline syenite of this area was weathered, under favorable conditions, to form high-alumina clay and bauxite. The clay of the Midway formation also was weathered to high-alumina clay and bauxite, but only where conditions were particularly favorable. Some of the shales in the Paleozoic rocks were likewise converted to high-alumina clay. About 50 square miles of the syenite mass was exposed to erosion and weathering in early Tertiary (post-Midway-pre-Wilcox) time, and in recent times about 14 square miles of it has been exposed to further weathering and erosion * * *.
>
> Some of the bauxite, especially the "granitic bauxite" found in some mines in Saline County, remained where it was developed and formed an irregular residual blanket on parts of the weathered syenite. However, most of the bauxite was subsequently transported, in some places only a short distance, to its present location where it was deposited as discontinuous, lenticular, nearly horizontal bodies fringing the syenite mass. These bodies may be compared with deposits of talus, soil material, alluvial fan and apron deposits, or alluvial valley fill. Closely associated with the bauxite deposits, and even more extensive, are deposits of high-alumina clay and kaolinitic clay, which are found immediately over, under and beyond the edges of the bauxite bodies.
>
> Deposition of transported bauxite of adequate quality and in amounts sufficient to form ore bodies occurred mainly at or near a change of slope or stream gradient on the old land surface. Commonly this change was at a line between hard and soft rocks (the buried contact between the syenite, and the Midway clay), and most of the ore bodies discovered in recent years have been on or close to this contact. Some bauxite, commonly in thin beds of low grade, has been found at a distance from the syenite, but bodies of ore are not to be expected far from the

---

[3] Map of Arkansas Bauxite District, Pulaski and Saline Counties, Ark. (Strategic Minerals investigations preliminary map), Geological Survey, February 1, 1944. Text by R. P. Bryson and Mackenzie Gordon.

syenite. *In general, the ore bodies remaining to be discovered will be found at the base of the Wilcox formation along the buried syenite-Midway contact, in the valleys tributary to the major buried drainage valleys of the district.* (Author's note: Italics not in original quotations.)

Stocks of bauxite on hand at mines and processing plants on December 31, 1943, totaled 540,700 short tons (dried bauxite equivalent) compared with 312,259 tons (revised figure) on December 31, 1942. Stocks at consumers' plants increased from 959,082 tons at the beginning of the year to 1,705,262 tons at the end. Metals Reserve Co. stock piles contained 2,562,140 tons at the end of 1943.

CONSUMPTION

Actual domestic consumption of bauxite (as determined by special monthly consumer surveys conducted by the Bureau of Mines for Federal war agencies) totaled 5,332,151 short tons (dried bauxite equivalent) in 1943 compared with a consumption of only 2,820,525 tons in 1942. The consumption figures for both years include calcined bauxite shipped for export to American-owned abrasive plants in Canada for the manufacture of crude abrasives which are returned to the United States for final manufacture and consumption. The figures do not, however, include dried bauxite shipped from Arkansas to the Canadian aluminum industry (257,214 tons in 1943 compared with approximately 100,000 tons in 1942). Consumption of the 5,332,151 tons was as follows: Alumina industry, 4,761,049 tons (includes some ore used for aluminum chemicals); chemical, 178,892 tons; abrasive (including refractories), 352,423 tons; and cement, oil-refining, and steel and ferro-alloy industries, 39,787 tons. Consumption of bauxite "as shipped" totaled 5,497,284 tons and consisted of 2,286,757 tons of crude bauxite, 2,988,571 tons of dried ore, 211,676 tons of calcined and sintered ore, and 10,280 tons of activated ore. Of the bauxite consumed (dried-equivalent basis), 26 percent was foreign ore and 74 percent domestic. The alumina industry used 99 percent and chemicals, abrasives, cements, and other uses 1 percent of the foreign ore consumed.

Apparent domestic consumption, shown in the table below, is presented upon two different bases; and apparent consumption within the United States does not correspond with the data above, inasmuch as the calculations are based upon "shipments" to domestic plants and do not consider fluctuations in consumers' stocks.

Shipments, imports, exports, and apparent consumption of bauxite in the United States, 1939–43, in short tons

[Dried-bauxite equivalent]

Year	Domestic shipments from mines and processing plants to industry			Imports	Exports	Apparent consumption within United States	Apparent consumption, including shipments to Canada for processing[2]
	Arkansas	Alabama and Georgia[1]	Total				
1939	375,925	15,331	391,256	582,601	96,925	876,932	971,000
1940	490,107	12,995	503,102	705,098	134,462	1,073,738	1,200,600
1941	960,741	89,389	1,050,130	1,250,532	244,934	2,055,728	[3] 1,928,052
1942	2,588,637	153,663	2,742,300	990,323	329,477	3,403,146	[3] 2,820,525
1943	6,457,351	204,232	6,661,583	1,726,961	592,300	7,796,244	[3] 5,332,151

[1] Includes Virginia in 1940, 1941, and 1943 and Virginia and Mississippi in 1942.

[2] Includes exports to Canada, inasmuch as virtually all of this bauxite is shipped to American-owned plants in Canada for manufacture into crude abrasives reimported into the United States for final manufacture and consumption.

[3] Actual consumption.

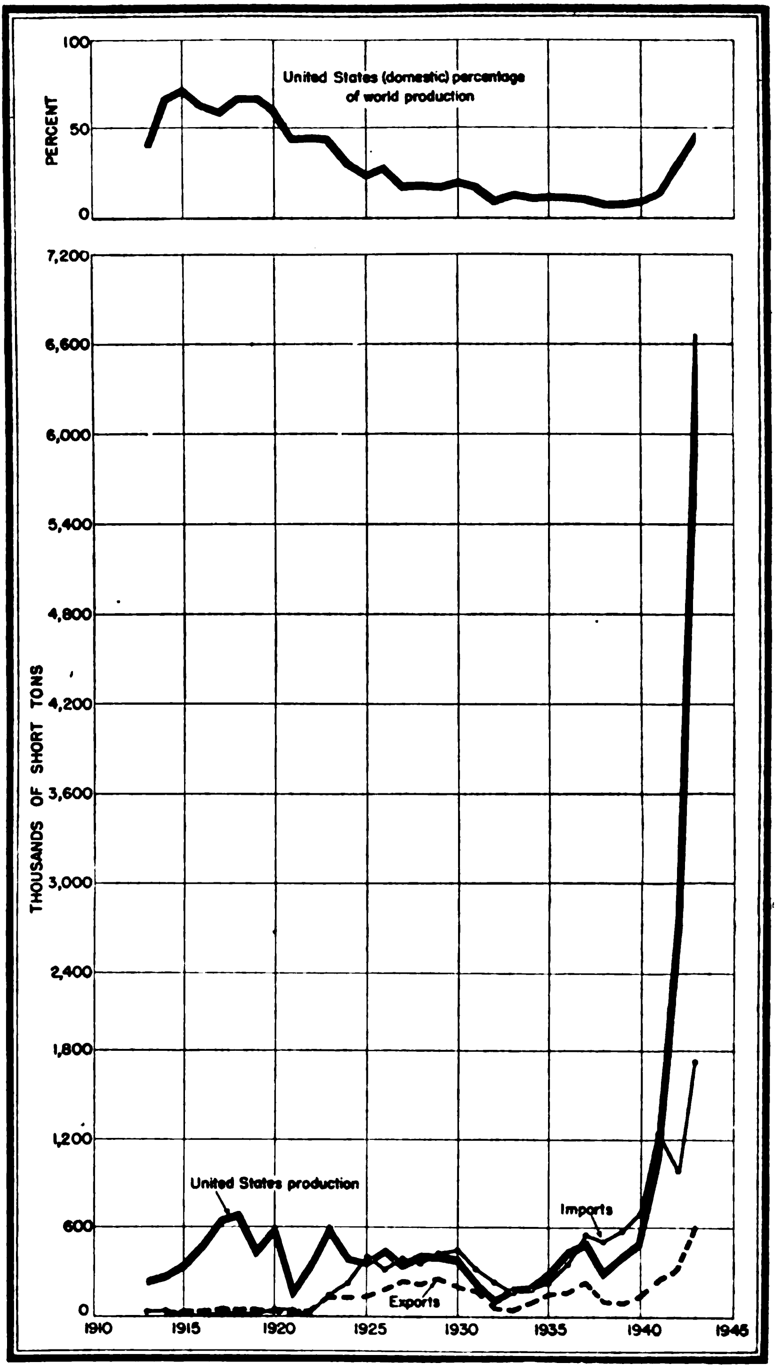

FIGURE 1.—Trends in production, imports, and exports of bauxite, 1913–43.

BY INDUSTRIES

The following table shows only shipments of domestic bauxite to consuming industries and excludes foreign ore.

Bauxite shipped from mines and processing plants in the United States, 1940–43, by consuming industries, in short tons

Industry	1940		1941		1942		1943	
	As shipped[1]	Dried-bauxite equivalent	As shipped[1]	Dried-bauxite equivalent	As shipped[1]	Dried-bauxite equivalent	As shipped[1]	Dried-bauxite equivalent

Total value	$3, 075, 317		$6, 155, 714		$13, 672, 727		$33, 372, 382	

[1] Includes crude, dried, calcined, activated, and sintered.

[2] Includes 672,000 tons (584,640 dried equivalent) shipped to Metals Reserve Co. stock piles.

[3] Includes 3,791,059 tons (3,195.106 dried equivalent) shipped to Metals Reserve Co. stock piles.

[4] Small quantity of bauxite shipped to makers of refractories probably included under "Abrasive."

Alumina.—Actual consumption of bauxite by the alumina industry increased approximately 114 percent over that in 1942 and comprised 89 percent of all the domestic and foreign ore used. The industry employed dried and undried ore from Alabama, Arkansas, Surinam (Netherlands Guiana), British Guiana, Brazil, and Jamaica. Estimated bauxite consumption in 1944 is expected to be about 14 percent less than that in 1943.

Abrasive and refractory.—Manufacturers of crude aluminous abrasive pigs in Canada and the United States received approximately 10 percent more domestic bauxite in 1943 than in 1942, being consigned 3 percent of all the domestic ore shipped to industry. Except for a small quantity from British Guiana, all of the calcined, sintered, and dried ore came from Arkansas. The industry's 1944 ore requirements are expected to exceed those of 1943 by about 11 percent. The use of bauxite in refractories is combined with abrasives. In 1943 the consumption of special aluminous refractory products increased substantially in the steel, glass, ship, and other industries.

Chemical.—The chemical industry consumed 30 percent less bauxite in 1943 than in 1942 and used 3 percent of all the domestic and foreign ore consumed. Shipments of domestic bauxite from mines and processing plants to the chemical industry increased 49 percent. Consumption by the industry in 1943 totaled 268,645 short tons of bauxite, but this includes ore used to make some aluminum chemicals other than those shown in the following table and does not include a large portion of the bauxite used in the manufacture of the alumina shown in the table. Ore used to make the aluminum salts and alumina shown in the table totaled approximately 298,932 tons. In addition to bauxite, producers of aluminum salts reported consuming 5,464 tons of alumina (calcined equivalent); 11,350 tons of secondary aluminum, aluminum scrap, and dross; 91,838 tons of clay; and a quantity of bichromate residues. Manufacturers estimated that their 1944 bauxite consumption will be 2 percent more than in

1943 (exclusive of a large part of the bauxite used in making alumina for the chemical and other industries).

Production and shipments of aluminum salts increased 7 and 6 percent, respectively, in 1943. Production of alumina (aside from that used in making aluminum) increased 48 percent, and shipments increased 67 percent. Of this alumina, only 6 percent was consumed by the producers of aluminum salts; the remainder was used in the manufacture of abrasives, refractories, petroleum products, spark plugs, glass, rubber, paints, and various other commodities.

Aluminum salts and alumina produced and shipped in the United States, 1942–43

[1] Includes 73 tons made from iron-free aluminum sulfate.
[2] Includes 71 tons made from iron-free aluminum sulfate.
[3] Includes 98 tons made from iron-free aluminum sulfate.
[4] Includes 100 tons made from iron-free aluminum sulfate.
[5] Includes 395 tons made from iron-free aluminum sulfate.
[6] Revised.
[7] Excludes alumina produced for use in making aluminum; includes activated, calcined, crude, light and heavy hydrate, converted to a calcined-alumina equivalent.

Aluminum salts shipped in, imported into, and exported from the United States, 1939–43

Year	Domestic shipments		Imports		Exports			
					Aluminum sulfate		Other aluminum compounds	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1939	494,032	$11,813,299	828	$22,335	34,734	$744,755	1,792	$208,455
1940	513,520	12,882,578	21	866	43,615	994,861	1,920	271,715
1941	626,384	17,382,675	(1)	231	51,261	1,184,169	2,815	349,951
1942	604,558	17,735,931	(1)	4	44,428	1,103,340	2,384	354,397
1943	642,822	20,295,028	3	941	37,946	963,151	2,922	307,288

[1] 147 pounds in 1941 and 50 pounds in 1942.

The plan of General Chemical Co. to convert its many aluminum sulfate plants from the use of bauxite as a raw material to the use of clay is now virtually complete. The calcining plant at Owensville, Mo., is in operation and calcining Missouri diasporic clays for shipment to the various alum works of the company. Some difficulty was experienced in the earlier stages of the change-over from bauxite to clay at some of the plants, but this has been largely overcome. A new producer of sodium aluminate entered the field during 1943, when the Marquette Cement Mfg. Co. began production.

Other.—Consumption of bauxite in the cement, steel and ferroalloy, and oil-refining industries rose 23 percent above the quantity used in 1942, and it is estimated that 1944 bauxite needs will exceed 1943 use by 23 percent. The use of thermally activated bauxite as an adsorbent and catalyst in the petroleum industry increased during the year and is expected to increase even more during 1944, as demand for high-octane aviation gasoline and synthetic rubber increases.

PRICES

In 1943 the average selling price, f. o. b. mines and processing plants, was $3.76 per short ton for crude (undried) bauxite, $5.45 for crushed dried bauxite, $11.45 for calcined bauxite, and $50.13 for activated bauxite. Values per long ton were as follows: $4.21 for crude, $6.10 for dried, $12.82 for calcined, and $56.15 for activated. The average value for all grades of domestic ores as shipped was $4.56 a short ton ($4.80 in 1942) or $5.11 a long ton ($5.38 in 1942).
